Для маніпуляції свідомістю можна використати будь-яке почуття, якщо воно допомагає хоч на хвилину відключити критичну свідомість індивіда. Дуже часто маніпулятори використовують страх, ненависть, любов. Все це підсилюється ефектами правильного

психологічного використання маніпулятором кольорової гами фонів та малюнків на сайтах в Інтернеті тощо.

Сучасна людина отримує необмежений потік інформації, який не можливо обробити критично. Саме така людина і є жертвою політичної маніпуляції свідомості. Така маніпуляція набуває масового характеру, бо має необмежені можливості масового поширення інформації, завдяки технологіям сучасності.

В результаті, поширення інформаційних технологій, все більша кількість людей буде залучена до інформаційного поля, яке використовується маніпуляторами для формування масової свідомості та маніпуляції нею.

Утвориться "психологічний натовп" – маса об’єднана не спільним простором, а за допомогою, наприклад, засобів масової інформації, яка є об’єктом масової маніпуляції свідомістю, що полягає у нав’язуванні своєї волі методом прихованого впливу.

"Жертва маніпуляції не усвідомлює самого факту здійсненого впливу на неї. Такий ефект досягається завдяки впливу на підсвідомість об’єкта маніпуляції", – зазначає вище згаданий Цуладзе. Все це призведе до тотального контролю свідомості людей, зниження їхньої критичної здатності.

Цей самий процес сьогодні відбувається і з епідемією грипу A/N1H1, інформаційний потік необмежний, критичний поріг українців низький, все це породжує паніку та ірраціональні дії.

В даних умовах необхідно заспокоїтись, обміркувати ситуацію, спокійно та виважено проаналізувати обставини, і не піддаватись масовому психозу, в межах розумного, вжити дії для захисту власного здоров’я та здоров’я своїх близьких.

Эпидемия, как политтехнологичный метод победы "против всех"

Украинская Правда, 6 ноября 2009, 09:47
https://www.pravda.com.ua/rus/articles/2009/11/6/4512290/

Кого там, іще спіткало затоварення медичними засобами та препаратами? Панове, не полишайте свій бізнес на одинці із тим лихом! Звертайтеся, ласкаво просимо! Звертайтеся до нашої влади. У цій справі вам стануть у нагоді усі її гілки, гілочки і, навіть, сучки та сучечки.

Перш за все, звісно, виконавча гілка. Вона – виконавча гілка влади, зовсім недорого попрацює задля вашого зиску. Перш за все заволає на усю країну: "Громадяни, тільки без паніки, без паніки, людонькиии!!! Усе під контролем! Усім усього вистачить: і ліків і індивідуальних засобів захисту!"

Вона турботливо повідомить з екрану, у скільки шарів слід згортати марлю, особисто зустріне в аеропорті вантаж ліків, заморозить ціни у такий спосіб, що люди умить скуплять весь ваш товар, навіть у аптеках Кабінету Міністрів та Верховної Ради.

Влада працюватиме цілодобово. У телевізорі.

У безмежжі своєї щирісінької довіри до неї, влади, наші громадяни миттю розметуть ваші кількарічні товарні поклади – на складах вітер гулятиме. Ажіотажний попит дасть роботу підприємствам на території усієї Євразії та інших континентів.

Україна перетвориться на одного з провідних імпортерів лимонів. Добре, що й вітчизняний виробник не лишиться без прибутку. Бабці на ринках хутко збуватимуть часник, цибульку, дуже зросте попит на редьку, хрін, топінамбур. А щоб їм не заважали усілякі часникові контрабандисти, то пильна влада поставить тим злодюжкам заслін.

А тим часом, епідемія розвиватиметься своїм шляхом і в Україну полинуть міжнародні чиновники від медицини, які мужньо вивчатимуть ситуацію у самісінькому джерелі інфекції, підтверджуючи перед телекамерами її – влади – обґрунтовану стурбованість та не забуватимуть пропонувати свої вакцини, можливо також із ваших складів.

Від телевізійного ґвалту перелякаються сусіди і їхні прикордонники вдягнуть маски, попри те, що рівень захворюваності в середині їхньої великої країни є вищими у рази, ніж в Україні.

Скориставшись приводом, влада скасує на три тижні заняття та осінній призов до армії. Вчителям та викладачам рекомендуватимуть взяти відпустки за рахунок літніх – економія державних коштів, як і у випадку із призовом.

Знову таки зайва бюджетна копійчина для закупівлі у вас, панове фармацевти, того, що потрібне для боротьби за життя й здоров'я населення. Не погребуйте!

І, хоча, марлеві маски носитиме абсолютна меншість громадян, у аптеках потрібні засоби та ліки лишатимуться у дефіциті, а лікарі з ніг збиватимуться, часто через необґрунтовані виклики громадян, усе одно, разом із вами – суспільно відповідальними вітчизняними та закордонними підприємцями – епідемію владою буде успішно подолано.

У телевізорі.

Ні, ви ж лишень не подумайте, що наший гарант та наша, відома своєї безкорисливістю опозиція, залишать владу наодинці із епідемією, із бюджетними і вашими грошима та з телевізійною перемогою.

Ні у якому разі.

Президент підставить своє плече. Опозиція взагалі буде робити те, що у Мексиці та Болгарії робили поліція та армія – роздаватиме марлеві пов'язки.

Щоправда у тих країнах маски роздавали на вулицях усім людям, а в Україні – у парламентських кулуарах депутатам та журналістам. І правда, вони ж так само – люди!

Втім, мирному населенню також трохи перепаде від партійно-депутатської щедрості. В агітаційних наметиках роздаватимуть пов'язки разом із листівками та газетками. І то хліб.

Не пастимуть задніх у цій справі й ЗМІ, коли у вас, наприклад, виникла затовареність очними краплями, то вам допоможуть масові газети, під рубрикою "PR", повідомляючи своїм читачам, що від грипу можна рятуватися й тими ліками (газета "Сегодня" від 3 листопада, архів номера в електронному вигляді відсутній, але у паперовому є).

Для того, аби громадяни лишалися у тонусі, телевізор постійно їм нагадує, скільки осіб вже пішли із життя через грип.

Добре, що хоча б не додумалися якимось особливим чином відзначати перехід порогу у сотню смертей.

Інформаційне суспільство зіграло із українською владою злий жарт. Чиновники-політики перетворюються на шоуменів й від того ефективність їхньої адміністративної роботи множиться на нуль.

Політика, зокрема й політика охорони здоров'я, підміняється політичними технологіями, засобами іміджмейкінгу та реклами. Дедалі частіше це технології "чорні", засновані на роздмухуванні паніки, настроїв ксенофобії, дезінформації та брехні.

Натомість системна, зокрема, і науково-аналітична робота щодо випрацювання стратегії, наприклад, боротьби з епідеміями не має попиту у політиків. Вони є клієнтами політтехнологів.

Кандидати у президенти та їхні посіпаки, кидають одне одному люті звинувачення, водночас подаючи себе, як єдино спроможну команду, здатну вивести країну "звідкілясь кудись", але громадяни, відірвавшись від телевізора та вийшовши на вулицю чудово усвідомлюють, що лишаються сам на сам з епідемією, злочинністю, сваволею хабарників та елементарним здирництвом бізнес-влади. Роздратування та зневіра ростуть.

Політикани і політтехнологи дружно й злагоджено руйнують та закопують нинішню систему суспільно-політичних взаємин країни, разом із собою. Загалом туди їм і дорога – і політиканам і системі – "всіх панів до одної ями...", але...

Ті, хто з понтом намагаються позиціонувати себе, як нові й здорові сили, насправді є породженням того ж хворого організму українського політичного середовища. Їхні мотивації до політичної діяльності та цінності, а також, що вкрай важливо, – їхні капітали сформовані завдяки тій самій системі яку вони, нібито намагаються зруйнувати.

У їхній обслузі ті самісінькі політтехнологи. Прихід до влади цих молодих та задиракуватих означатиме не злам, а консервацію корупційного консенсусу некомпетентної еліти.

Щоб убезпечити себе від суспільної дискредитації політичні банкрути спробували вилучити з виборчого бюлетеня рядок "Проти усіх". Щось там не зрослося і цю позицію наразі залишено.

Отже, поставимо суто теоретичне запитання: коли у другому турі виборів президента кількість тих, хто проголосує проти обох кандидатів перевищуватиме суму голосів поданих за них разом узятих, то на яку суспільну підтримку спиратиметься проголошений президент?

Що тоді взагалі являтиме собою влада з точки зору суспільної легітимності?

УКРАЇНСЬКА ПРАВДА

Ігор Попов,

Выборы ведут к "свиному" сценарию

Украинская Правда, 6 ноября 2009, 14:01
https://www.pravda.com.ua/rus/articles/2009/11/6/4512365/

Епідемія грипу радикально змінила хід виборчої кампанії в Україні. Змінено пріоритетність питань порядку денного, поламано плани агітаційних кампаній, штаби терміново переглядають набір технологій для просування своїх кандидатів.

Для розуміння наслідків грипозного ефекту на кампанію необхідно розділяти фактор власне масових захворювань, фактор паніки серед населення, та перші спроби політичних спекуляцій на темі грипу.

Скандальний та кризовий характер цієї виборчої кампанії був прогнозований. Останні кампанії 2006, 2007, а також київських виборів 2008 року – базувалися на спекуляціях жадібністю виборця.

Основними трендами були змагання обіцянок щодо розміру соціальних виплат або навіть суми прямих проплат виборцям за голоси. Фінансова криза зробила використання цих методів неможливими. А спроби керівника уряду обіцяти підвищення зарплат всім категоріям виборців, боротьба опозиції за закон про соціальні стандарти – не дали різкого росту рейтингів. Виборець почав розуміти, що ці обіцянки або не будуть виконані, або лише приведуть до інфляції і обвалу курсу нацвалюти.

Перші обміни компроматними ударами також не дали ефекту, що також було прогнозовано. Фальшиві дипломи, дачні будиночки в Межигірї чи навіть депутати-педофіли – стали серіями мильних опер, але не дали голосів упертого електорату.

Залишався єдиний інстинкт, на якому можна заробити електоральні дивіденди – страх. Завезені з півночі технологи кількох кандидатів вважають гексогеново-терористичні сценарії 1999 року одним із еталонів зламу виборчої кампанії.

Прихід каліфорнійського штаму грипу в Україну виявився дуже вчасним. Без інформаційної кампанії навколо цього порядок кандидатів у рейтингу навряд чи змінився би і до 7 лютого. Саме криза, всеохватна, з залученням кожного громадянина, з емоціями і панікою – може реально вплинути на результат виборів.

Одразу відкинемо версію про штучний характер епідемії. Фахівці доводять, що вона таки є, і що дійсно хвороба серйозна і боротися нам з нею не один тиждень. На жаль, прихід епідемії ми проспали, так само як і прихід фінансової кризи.

Перші десять днів боротьби з грипом – 10:0 на користь епідемії. Система влади реагує досить повільно і часто непрофесійно, у боротьбі більше політики а не фаховості.

Якщо далі піде так само, і кількість хворих зростатиме, неодмінно постане питання введення надзвичайного стану. У цьому питанні має бути мінімум суб'єктивізму та політиканства.

Якщо в діючих правових умовах влада не впорається – треба вводити надзвичайні умови щодо правил, процедур та менеджменту.

Надзвичайний стан дозволить взяти під контроль внутрішніх військ та підрозділів МНС розподіл ліків, дотримання обов'язковості заборони масових заходів, виконання рішень РНБО без політичних дискусій, і нарешті мінімізує появу політиків з коментарями щодо медичних нюансів. Менеджмент операції через єдину вертикальну систему штабів із чітким підпорядкуванням прибере бюрократичні перепони та конкуренцію відомств.

Будемо сподіватися, що Уряд справиться з епідемією і без надзвичайного стану, але якщо вірус і паніка не будуть погашені – керівник уряду стане перед серйозною дилемою.

Випустити ситуацію з-під контролю – це пряма загроза національній безпеці. Зробити подання про надзвичайний стан – це перенесення виборчої кампанії та втрата шансів на перемогу.

Епідемія вже ставить питання щодо рівності кандидатів та прав виборців. Режим карантину діє в областях одного політичного "кольору" і не діє в інших, що впливає на доступ виборців до інформації.

Заборона масових заходів більше вдарила по опозиційних кандидатах, бо кандидати при владі можуть відвідувати карантинні області, зустрічатися з активом, із пресою у рамках боротьби з епідемією, опозиційні кандидати таким чином є дискримінованими. Спірними з точки зору закону можуть виглядати роздачі медикаментів та масок кандидатами, хоча з моральної точки зору ми їх розуміємо. Презентація програм і дискусії навколо змісту програм стали просто нецікавими.

Масова захворюваність призупинила постановку агітаційних наметів та відмінила інші методи особистої агітації виборців. Зараз можуть виникнути проблеми з набором кандидатів у виборчі комісії та з кворумом у комісіях.

ЦВК сподівалася провести роботу по уточненню реєстру виборців, яка не була проведена за два роки, в останні місяці перед виборами. Але в умовах карантину зробити це буде важко, що посилить і так існуючу проблему якості списків. Навіть явка виборців може бути меншою на 15-20% через хвороби та відмову відвідати дільниці – місця масового скупчення людей.

Маючи більше ніж 2 місяці до дня голосування, цілком можливо подолати першу хвилю каліфорнійського грипу і не допустити наступні хвилі. Проте в разі оголошення надзвичайного стану вибори треба буде не призупиняти, а переносити.

В разі дії режиму надзвичайного стану протягом двох місяців, нова дата виборів може припасти на 30 травня, одночасно з місцевими виборами, що до речі зекономить державі мільярд гривень. Одночасні вибори ускладнюють роботу комісій, проте в умовах економічної кризи потрібно економити.

Звичайно, тема епідемії відвернула увагу громадськості від пустого бюджету, невдалого газового контракту, відключеного опалення, такфірських терористів та навіть розслідування

педофілгейту. Проте паніка не буде триматися всі три місяці, що показує світовий досвід проходження і пташиного грипу, і коров'ячого сказу, і появи свинячого грипу в інших країнах.

Нові кризи можуть принести нові радикальні повороти в сценарії виборів. За новітньою традицією, кожного Нового Року ми з друзями крутимо крани на газовій трубі, а Європу посилаємо в баню.

Якою буде газова війна цієї зими і хто на ній виграє – залишається питанням. Проте це питання можна зняти і зараз, якщо уряд доб'ється письмової фіксації змін до контракту січня 2009 року, щоб Україна була впевнена у відсутності штрафних санкцій за недобір газу, тому що поки ми маємо лише усні обіцянки.

Знову найближчим часом постане інша проблема - як уряд боротиметься з українською економікою: доб'ється друкування коштів чи перестане платити зарплати? Сподівання, що зарплати за листопад-грудень ми отримаємо прямо з бюджету МВФ на зарплатні картки – поступово розсіюються.

Звичайно, дехто пам'ятає вибори в Росії в 1996 році, коли міжнародних банкірів залякали комуністичним реваншем, і кредити привозили одразу готівкою у ящиках з-під ксерокса, проте повторюсь – "Україна не Росія"…

І якщо ці кризи не зламають хід виборів, є в запасі ще і погроза: "Навіть якщо ти виграєш вибори, спробуй виграти суди". Коли в лютому нам набридне грип, ми можемо запустити революцію, суди, і історія яка в 2004 році була драмою, за класикою жанру виглядатиме в рімейку по іншому.

Я пишаюся нашими виборами. І навряд чи можуть нас чомусь навчити ті, хто максимум що міг придумати під свої вибори – нещасна "прослушка" в готелі "Уотергейт" чи шашні Білла з практиканткою. Хоч у чомусь наші технології – високі. І ми зможемо хоча би їх експортувати. Якщо за цими іграми збережемо країну.

KYIV POST
UKRAINE'S GLOBAL VOICE

U.S. to donate 930,000 doses of H1N1 vaccine to Ukraine in early December

Kyev Post, 7 November 2009, 21:10
https://web.archive.org/web/20091108013250/http://www.kyivpost.com/news/nation/detail/52093/

"In an effort to stop the global spread of pandemic 2009 H1N1 influenza virus, the United States is planning to donate 10 percent of US domestic H1N1 vaccine supply, as it becomes available, to a WHO-led H1N1 vaccine initiative. The US donation to WHO, equivalent to 25 million doses of vaccine, would be valued commercially at approximately $10 million," the embassy said in a statement.

As part of the first phase of this initiative, Ukraine is scheduled to receive 930, 000 doses of H1N1 vaccine in early December, the embassy said.

"Planning to complement this donation with a broad range of interventions to support the safe delivery and deployment of the vaccines, the US government will be working closely with the government of Ukraine in the days ahead to identify needs and agree on a package of immunization-related commodity and technical support that can be implemented rapidly to support H1N1 immunization," the statement reads.

Besides, the US government is prepared to make available immunization ancillary materials such as syringes, needles, and vaccine safety disposal boxes, to provide technical support for immunization planning as well as for logistics and assistance to transport the vaccine, to train vaccinators and other professionals, and to prepare communications materials in support of the immunization campaign

THE FLU CASE

Will the US supply the Ukrainian government with swine flu jabs for forced vaccinations?

The Flu Case, 7 November 2024
https://web.archive.org/web/20100102011633/http://theflucase.com/index.php?option=com_content&view=article&id=1680%3Awill-the-us-supply-the-ukrainian-government-with-swine-flu-jabs-for-forced-vaccinations&catid=1%3Alatest-news&Itemid=64&lang=en

The American media is full of stories about how a shortage of swine flu vaccine is driving up demand, and yet according to this report in the Kyiv Post, the US has a "domestic reserve" of swine flu jabs big enough to allow 930,000 doses to be donated to the Ukraine in early December, around the time when a Ukrainian forced mass vaccination campaign as indicated by Prime Minister Viktor Yushchenko could start.

The swine flu jabs Pandemrix and Focetria are classified as bioweapons by EU and US regulators, according to biopharma databases, giving the mass vaccination campaign conducted under martial law the character of biological warfare.

ALGEMEEN / BUITENLAND

Slowakije sluit grens met Oekraïne om griep

NU.News, 7 november 2009, 16:57
https://web.archive.org/web/20100106024625/http://www.nu.nl/buitenland/2118199/slowakije-sluit-grens-met-oekraine-griep.html

BRATISLAVA - Slowakije sluit op één na alle grensovergangen met Oekraïne vanwege de Mexicaanse griepepidemie. In Oekraïne zijn bijna 900.000 mensen besmet geraakt, van wie er ten minste 135 zijn overleden.

Bij de belangrijkste grensovergang Vysne Nemecke, die open blijft, worden artsen en hygiënisten gestationeerd.

Zij moeten iedereen die de grens over wil, controleren op griepverschijnselen. Wie mogelijk besmet is mag niet verder.

De grens tussen Slowakije en Oekraïne is de oostelijke grens van de Europese Unie. Wie Slowakije binnenrijdt, kan via de open grenzen verder reizen naar de meeste landen in de EU, waaronder Nederland.

THE FLU CASE

Ukraine closes all borders to Slovakia (and EU) due to the swine flu

The Flu Case, 10 November 2009, 20:41
https://web.archive.org/web/20100102035426/http://theflucase.com/index.php?option=com_content&view=article&id=1673%3Aclusters-of-hemorrhagic-h1n1-pneumonia-in-ukraine&catid=1%3Alatest-news&Itemid=64&lang=en

BRATISLAVA - Slovakia closes all but one border to Ukraine because of the flu outbreak. In Ukraine there are now more than 900.000 people infected and 135 have died so far.

At the only open border at Vysne Nemecke, doctors are stationed to check EVERY PERSON for flu symptoms. Anyone who exhibits signs of flu symptoms is not allowed in the country.

The border between the Ukraine and Slovakia is the East border of the EU. When a person enters this border, free travel within the EU is possible without checkpoints.

THE FLU CASE

Clusters of Hemorrhagic H1N1 Pneumonia in Ukraine

The Flu Case, 7 November 2009
https://web.archive.org/web/20100102035426/http://theflucase.com/index.php?option=com_content&view=article&id=1673%3Aclusters-of-hemorrhagic-h1n1-pneumonia-in-ukraine&catid=1%3Alatest-news&Itemid=64&lang=en

Recombinomics Commentary, 4 November 2009, 11:54
Ivano-Frankivsk Oblast

All the six dead young people had symptoms of severe hemmorhagic pneumonia. The disease starts slowly, with temperature rising to 37.2 - 37.3 degrees, slight cough and pain in joints. Nasal catarrh developed at the end of the second or third day. Autopsy revealed that the lungs were soaked with blood, the oblast chief specialist said.

The above comments are from an early story describing cases in Ukraine. The clustering of hemorrhagic cases raised concerns. The concern was increased by anecdotal reports citing a high frequency of such cases in Lviv (see map). The recent WHO announcement that they were initially focusing of severe acute respiratory illness in Lviv also increased concerns.

Hemorrhagic pneumonia was also observed in the 1918 pandemic and was thought to be linked to cytokine storm. Consequently, those with robust immune systems (previously health young adults) disproportionately died, which has also been seen in the current outbreak (Mexico, US, and worldwide). However, the cases in Ukraine appear to be clustered, raising concerns that the virus has changed.

However, the change may be minor, since the current H1N1 has produced the above symptoms in earlier cases. More severe cases may be linked to a higher viral load, which could be linked to minor genetic changes, or simply due to concentration of virus in schools. In the US the spread of the virus has been linked to school openings, which lead to an explosion of cases and subsequent student deaths. However, now there are increases in fatalities in teachers and administrators, increasing concerns worldwide.

In Ukraine, weather changes and heating issues may have led to a surge in cases, and increased concentrations of virus could have produced conditions favoring high viral loads and increased cytokine storms.

Samples have been sent to Mill Hill, and sequence data should be released shortly. Similarly, investigations on hemorrhagic pneumonia in lviv should help resolve the mechanism for the high concentration of such cases in western Ukraine.

However, H1N1 spread in Kiev has been noted, and other countries such as Belarus have announced additional H1N1 suspect or confirmed fatalities.

Sequence analysis of these cases and an update on the frequency of hemorrhagic pneumonia in Ukraine and worldwide would be useful.

THE FLU CASE

Opposition party candiates banned from travelling in the Ukraine
Elections to be postponed

The Flu Case, 7 November 2009, 09:55

https://web.archive.org/web/20100102035502/http://theflucase.com/index.php?option=com_content&view=article&id=1675%3Aelections-in-ukraine-may-be-postponed-under-pandemic-pretext&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Ukrainian government could soon declare a national emergency, and postpone elections due to be held on January 17th until May 30th under the pretext of fighting a pandemic, Ihor Popov, an advisor of President Viktor Yuschenko, said yesterday.

"The pandemic has radically changed the election campaign," Popov told Ukrainskaja Prawda» on Friday.

"The prohibition against public meetings affects candidates of the opposition parties," he added.

Candidates of the incumbent ruling party who have a government job will still be allowed freedom of movement and be able to visit regions under quarantine and conduct election rallies, unlike candidates for parties challenging the incumbents in the upcoming elections.

"The flu has become a new political technology in the Ukraine," the Ukrainian edition of the Russian newspaper Izvestia said.

The head of the government Julia Timochenka, who is trailing in opinion polls, was the first to put on a face mask, and is omnipresent in the local media, according to the AFP.

"Timochenko is playing the role of the chief epidemiologist of the country," said Volodymyr Fesenko, driector of the political research center Penta.

Timochenko has appealed to all Ukrainians to wear face mask. Last, week she also met in person an airplane bringing 16 tonnes of Tamiflu drugs from Switzerland.

Mykhaïlo Brodski, an independent candidate in the elections, has said that the pandemic hysteria is being used to "turn people's attention away from real problems."

"The election campaign has already offered us (...) paedophila and the plague. The next attacks will probably be dedicated to cannabilism and vampires," said a popular Ukrainian blogger.

The presidential campaign has been tarnished with accusation of paedophila against three deputies associated with Julia Timochenko and the suspicion that the opposition party is going to be robbed of an electoral victory.

the Source is not known - AFP / 02 novembre 2009 18h10

“La grippe est devenue une nouvelle technologie politique en Ukraine”, ironisait lundi l’édition ukrainienne du quotidien russe Izvestia.

La chef du gouvernement Ioulia Timochenko, qui figure en deuxième place dans les sondages, a été la première à monter au créneau, devenant omniprésente dans les médias.

“Timochenko joue le rôle de l’épidémologiste en chef du pays”, raille Volodymyr Fesenko, le directeur du Centre de recherches politiques Penta.

Puis, durant le week-end, Mme Timochenko a pris le chemin des plateaux de télévision, appelant les Ukrainiens à se munir de masques chirurgicaux, quitte à les fabriquer eux-mêmes.

Infatigable, elle est allée accueillir personnellement dans la nuit de dimanche à lundi un chargement de 16 tonnes d’antiviral Tamiflu, commandé d’urgence en Suisse.

“Ce sont des héros”, note, sarcastique, sur son blog Mykhaïlo Brodski, un candidat indépendant à la présidentielle, accusant les dirigeants ukrainiens de jouer sur “l’hystérie pour détourner l’attention des gens des problèmes réels”.

“La campagne électorale nous a déjà offert (…) +la pédophilie+ et +la peste+. Les prochaines attaques seront probablement dédiées au cannibalisme et aux vampires”, résume, cinglant, un autre bloggeur populaire ukrainien.

Car le début de la campagne présidentielle a déjà été terni par des accusations de pédophilie contre trois députés proches de Mme Timochenko et des soupçons de viol visant M. Ianoukovitch.

FROMTHEOLD

Trail leading to Pneumonic plague in Ukraine involved "chemtrails" or mysterious spray, fears of vaccine

From The Old, 8 November 2009, 09:48
https://web.archive.org/web/20091110232904/http://fto.co.za/news/trail-pneumonic-plague-ukraine-chemtrails-spray-fears-vaccine-2009110815746.html

In 2002 the US military was acused of “conducting a chemical weapons research and development program in violation of international arms control law” Whereby they replied

“JNLWD's [US Department of Defense's Joint Non-Lethal Weapons Directorate] secret program is not focusing on highly lethal agents such as VX or sarin. Rather, the emphasis is on "non-lethal" chemical weapons that incapacitate. JNLWD's science advisors define "non-lethal" as resulting in death or permanent injury in 1 in 100 victims.(1) JNLWD's Research Director told a US military magazine "We need something besides tear gas, like calmatives, anesthetic agents, that would put people to sleep or in a good mood." These weapons are intended for use against "potentially hostile civilians", in anti-terrorism operations, counterinsurgency, and other military operations.

The major focus of JNLWD's operation is on the use of drugs as weapons, particularly so-called "calmatives", a military term for mind-altering or sleep inducing chemical weapons.”

March 26 (2009) it was reported that Vaccine side effects scare grips Ukraine as thousands of Ukrainians refused the vaccinations being scared of diseases like diphtheria, mumps, polio, hepatitis B, tuberculosis, whooping cough among others.

Then the Health officials said that the fear of getting these vaccinations could lead to disease outbreaks spreading through out the Soviet republic and beyond. Health officials around the world then said they are struggling with the repercussions of the vaccination fears as they were unwarrented and dangerous

June 26 (2009) Suspicious aircrafts were forced to land. A US operated AN-124 changed its call sign from civillian to military which then triggered a response from the IAF upon entering Pakistani air space, the plane was forced to land in Mumbai while the second one was forced down by Nigerian figther jets that also arrested the crew.

According to reports China (China’s People's Liberation Army Air Force) contacted the Indian and Nigerian intelligence officials about the presence of these US operated Ukranian aircrafts amidst growing concern that the United States were spreading "biological agents" in the Earth's atmosphere also which some Chinese officals believed to be a attempt to mass genocide via the spread of h1n1 swine flu.

The strange thing about these reports and arrests as well as the forcing down of the planes were that these aircrafts were carrying "waste disposal" systems that could spray up to 45000kg or 100pounds of aerial type mist from sophisticated network of nano pipes that led throughout the trailing edges of the wings thereby dispersing whatever was in these tanks through a mist.

Airplane registration was UR-CAK;

People usually call these chemtrails.

19 September (2009) A Chicago researcher dies working with Yersinia pestis (the plague) (which is now supposedly spreading through Ukraine)

A University of Chicago researcher died Sun., Sept. 13, at the Medical Center's Bernard Mitchell Hospital from an infection which may be attributable to a weakened laboratory strain of Yersinia pestis, the bacteria that causes the plague.

The researcher studied the genetics of harmful bacteria, including a weakened strain of Yersinia pestis that lacks the bacteria's harmful components. This strain is not known to cause illness in healthy adults and has been used in some countries as a live-attenuated vaccine to protect against plague. It has been approved by the Centers for Disease Control and Prevention (CDC) for routine laboratory studies. The weakened strain does not require the special safety precautions required for work with virulent strains.

Though there does not appear to be a threat to the public, and no other illness related to this case has been reported, the Medical Center infection control team is working with the Chicago Department of Public Health (CDPH), the Illinois Department of Public Health (IDPH) and the CDC to investigate the case and take all appropriate precautions.

“This death is a tragic loss to our community,” said James L. Madara, MD, Dean of the Biological Sciences Division and Pritzker School of Medicine, and CEO of the Medical Center. “We are all saddened to lose a valued colleague.”

The patient's initial autopsy showed no obvious cause of death except for the presence of bacteria. Routine cultures of the patient's blood grew the weakened strain of Y. pestis. Whether the attenuated strain caused the fatal illness in this researcher remains uncertain. Additional studies to assess the connection are underway.

Nevertheless, once the attenuated strain of Y. pestis was identified on Sept. 18, Medical Center officials immediately notified the CDPH. As a precautionary measure and in cooperation with the CDPH, Medical Center personnel began notification of family, friends, colleagues and health care personnel who may have had contact with the patient.

People exposed to Y. pestis typically develop symptoms within 2 to 10 days. None of the potential contacts has reported illness. The weakened strain is not believed to be dangerous to healthy individuals, but underlying health conditions could potentially increase susceptibility. Anyone who might have been exposed will be offered antibiotics as a precaution.

While rare in the United States, plague remains a significant problem in the developing world, where up to 3,000 cases are reported every year. U.S. cases still occur in parts of California, Colorado, Utah, Arizona, Nevada and New Mexico. The last known case of person-to-person transmission of plague in the United States occurred in 1924.

Then **LAST WEEK** Airplanes sprayed mysterious substance over Ukraine days before pneumonic plague outbreak => https://web.archive.org/web/20091109014651/http://fto.co.za/news/airplanes-sprayed-mysterious-substance-ukraine-days-pneumonic-plague-outbreak-2009110615732

Kiev, Ukraine - Authorities in the town of Kiev, Ukraine denied any spraying of "aerosolized medication" by aircraft over the city. This after it was reported that light aircrafts were seen flying over the forest market area that sprayed a aerosol substance to fight h1n1 or swine flu.

5 Sources confirms this and the local newspapers of Kiev also received hundreds of phone calls from residents and business owners close to the area the planes were spraying the suspicious substance. Not only that but local businesses and retailers were "advised" to stay indoors during the day by the local authorities.

As if that is not enough, the government authorities also pushed the radio stations in Kiev to deny the reports. Online on forums, websites and blogs reports came in about eye witness accounts that confirms this. There was also reports of helicopters spraying aerosols over Kiev, Lviv, Ternopil and throughout Ukraine.

30th October the Ukraine president Viktor Yushchenko ordered the army or Ministry of Defense to establish mobile hostpitals to provide “essential medications” for people infected with h1n1 (swine flu).

Then just recently the entire Ukraine was put under martial law, more shocking is the statement before the serious pneumonic plague broke out “Due to the complex epidemiological situation in the western regions of Ukraine, where tens of thousands of people have become ill, thousands are in hospital, and dozens have died.”

So what exactly is going on here? Coincidence or not?

THE FLU CASE

Ukraine first and Austria second for martial law?

The Flu Case, 8 November 2009, 14:13
https://web.archive.org/web/20100102024057/http://theflucase.com/index.php?option=com_content&view=article&id=1697%3Aukraine-first-and-austria-second-for-martial-law&catid=1%3Alatest-news&Itemid=64&lang=en

On a cold, overcast December afternoon in 2004, I briefly met with Viktor Yuschenko, the Ukrainian President.

He had been treated for poisoning at a hospital in Döbling and when he was released, he held a press conference surrounded by doctors and attended by scores of journalists.

Yuschenko stood there barely saying a word, looking haggard and with a bluish pallor: his face was pock marked and his hair was an unnatural colour; his eyes were full of mistrust and fear even though the private Rudolfinerhaus clinic held few threats.

Five years on, this shattered looking individual, who was once the head of a pro democracy movement, is about to proclaim himself a dictator.

Ukraine is the first country to come under the control of the WHO and the UN under the International Health Regulations 2005, and the reality is that Yuschenko and his Prime Minister Julia Timoschenko are just carrying out the orders from WHO and the UN when they suspend civic rights and democracy under the pretext of fighting a pandemic emergency.

Whatever is left of freedom in the Ukraine is about to be extinguished:
- Elections in January are set to be suspended.
- Demonstrations have been banned.
- Political opponents have been prohibited from travelling inside areas put under quarantine.
- Borders have been partly closed already.
- Critics of a mass vaccination campaign are facing criminal prosecution and goal.
- Huge swathes of land have been put under quarantine.

Plans are in the works for the forced vaccination of people with a toxic and untested swine flu vaccine. The US government is planning to send nearly a million doses of the jab. a substance classified as a bioweapon, to the Ukraine by early December…..

Pregnant women and children are the first to be given the jab which Yuschenko using the twisted logic and lies worthy of the Nazi Propagandist Josef Goebbels has said must be administered to them to "protect their health".

Tents belonging to Eurolab have sprung up in Kiev offering treatment against the flu http://ukrainiantranslator.blogspot.com/.

Eurolab appears to be the diagnostic department of the German scandal-hit coporate giant Siemens in yet another private government partnership. http://clinic.eurolab.ua/en/eurolab/

Yuschenko has justified implementing martial law on behalf of WHO by the sudden appearance of a pneumonic plague in the western part of the Ukraine that appears to be artificially engineered.

There have been reports of planes spraying towns before the appearance of the plague. WHO was part of an exercise on plague bioterrorism just a month before the actual plague appeared. Baxter has a facility in the Ukraine.

WHO and the international corporate crime syndicate that fund them, may have decided that they could not go ahead with their plan to trigger a pandemic in Europe and the USA because the public awareness of the dangers of the vaccine jab has become too great, not least as a result of WHO and Baxter being caught contaminating 72 kilos of vaccine material with the live bird flu virus in February.

Miniscule numbers of people have gone to take the swine flu vaccine across Europe. In Sweden the numbers might also be as low as a few thousand because the government only counts how many doses of the swine flu have been distributed (1.4 million) and not how many jabs have actually been given.

The Ukraine may, therefore, have seemed like a better place to test their model and carry out their plan of generating a plague, panic, confusion, declaring a mutated virus, inserting the virus into vaccines, and waging biological warfare against defenceless civilian population eventually using Ukraine's own army and military through a forced vaccination programme.

Expect WHO, which is examining the Ukrainian mystery virus, to announce the swine flu has morphed into the bird flu to spread panic. This will be an excuse for WHO to insert the live bird flu virus into vaccines, and so spread the pandemic even further.

WHO has been preparing for years for a bird flu pandemic, after all. The bird flu is an artificial lab virus reconstructed from the Spanish Flu pandemic virus by US scientists in a bioweapons lab.

The Austrian corporate media – controlled by the same corporate crime syndicate that pull the strings of WHO – are preparing the people here for the idea that the pandemic could soon spread. Five flights a day land from Kiev and there are no precautions to test infected people in place, pipes an Austrian newspaper.

How long until the Austrian newspapers declare the plague or bird flu has reached Austria? How long until we see the attempt by the government at the brutal implementation of martial law preceding forced vaccinations and quarantines?

The number of police and private security forces patrolling on the streets in Austria has certainly increased dramatically recently. There are even uniformed, private security guards now patrolling Vienna University's libraries, something totally new. Extra police have been put in the airports and border crossings. The army command structure has been centralized.

Special army units based in Korneuburg, the same place where Baxter has its facilities, have bene practicing pandemic emergency exercises and quarantining patients in hospitals.

The Austrian government is facing protests from students and an ecomonic collapse engineered by the corporate crime syndicate that funds big pharma and WHO. The government has saddled the Austrians with huge debts to the banks that will suck out of the economy huge amounts of money leaving even less for students, pensioners as Depression comparable with the 30s approaches.

The evidence of crimes committed by members of the government is so great that if the Justice Minister Claudia Bandion Ortner were not herself so corrupt, then most of the parliament would be in gaol.

How long until the Austrian government, corrupted to the core, threatens people with martial law under the pretext of a pandemic to avoid having to face accountability for their crimes?

How long until WHO and UN officials following the orders of the banksters and pharma companies take over the health service and the police and mandate forced vaccinations and quarantines in Austria?

With a bridgehead in western Europe for their pandemic plans, WHO could then attempt the same tricks in other countries as in Austria.

newsru.com

Минздрав Украины завалил страну препаратами "Тамифлю" и теперь не знает, что с ними делать

News.Ru, 9 ноября 2009
https://www.newsru.com/world/09nov2009/tami.html

Министерство здравоохранения Украины делает неоправданно масштабные закупки препарата "Тамифлю", справляющегося с вирусом свиного гриппа. Уже закуплено 500 тысяч доз - этого количества хватит для лечения 700 тысяч человек. Однако, по официальной статистике на понедельник, гриппом A/H1N1 в стране болеют 65 человек.

Несмотря на это, ожидается поставка еще 400 тыс доз лекарства, и, таким образом, всего на его закупку будет израсходовано 60,3 млн грн из 115 млн, выделенных правительством именно на обеспечение противогриппозными лекарственными препаратами, пишет "Дело".

Главный санитарный врач Украины Александр Биловол сообщил, что Минздрав уже потратил 70% из общей суммы в 500 млн грн, выделенных на борьбу с эпидемией гриппа. Зачем министерство осуществляет такие масштабные закупки препарата "Тамифлю", Биловол объяснить не смог. Более того, он подтвердил, что для профилактики свиного гриппа это лекарство использовать нельзя.

Ранее врачи предупредили, что "Тамифлю" необходимо использовать только после консультации с врачом, поскольку его неправильное применение может быть очень опасным для организма человека, отмечает NEWSru.ua.

Этот препарат уже вызвал нарекания в России. Директор НИИ гриппа РАМН Олег Киселев не рекомендовал давать его детям, у которых может возникнуть ряд побочных эффектов: рвота, бессонница, диарея, головная боль, кашель и боль в животе.

Отметим, впрочем, что по многим заявлениям врачей, "Тамифлю" пока является единственным в мире препаратом, способным бороться со свиным гриппом. Однако Всемирная организация здравоохранения (ВОЗ) подтвердила уже 39 случаев заражения вирусом, который оказался устойчивым к "Тамифлю". Последний такой случай зарегистрирован на прошлой неделе в Нидерландах.

Впрочем, "запасливость" украинского Минздрава может оказаться полезной: глава ВОЗ Юкка Пуккила прогнозирует, что страна может столкнуться со второй волной эпидемии гриппа A/H1N1, которая может продолжаться более длительный период.

THE FLU CASE

Ukrainian Prime Minister tells supporters to carry "infection" to every village and city

The Flu Case, 9 November 2009

https://web.archive.org/web/20100102045109/http://theflucase.com/index.php?option=com_content&view=article&id=1707%3Aukrainian-prime-minister-tells-supports-to-carry-qinfectionq-to-every-village-and-city&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Ukrainian Prime Minister Julia Tymoschenko appears to have told supporters attending a recent election rally that she is sure they will carry an „infection" back home in a clip on Youtube.

According to a Ukrainian blog, Tymoschenko said to supporters: "*And I know that when each one of you goes home, that you will carry a part of this good, wonderful infection of battle for freedom into every village and city. Will you be able to do that?*"

The Ukrainian blogger speculates whether it was a slip of the tongue or whether the clip is taken out of context and the word "infection" had another metaphorical meaning. The clip is certain to fuel fears that the pneumonic plague that appeared mysteriously in western Ukraine was engineered by Tymoschenko and Ukrainian President Viktor Yuschenko in order to declare martial law and retain power with an election on the horizon.

=> in German

Beim Treffen im Café war auch ein neuer Typ dabei, den ich nicht kannte. Ein Marketing-Experte. Ich habe ihn nebenbei zu seinen Eindrücken zum Thema Grippe in der Ukraine befragt.

Erstens meinte er, dass seine Schwester vor einer Woche in Iwano-Frankiwsk war, also im Westen der Ukraine, wo sie herkommt. Es waren dort keine Medikamente erhältlich, weil die Leute aus Panik alles aufgekauft haben. Die Ärzte hätten dadurch angeblich auch keine Patienten mit wirklichen Beschwerden behandeln können. Danach ist seine Schwester in die Karpaten zum Skifahren gefahren. Sie ist immer noch dort und meinte zu ihm, dort wäre alles ganz ruhig und man könnte wirklich ganz normal Urlaub machen.

Dann meinte er, dass die Grippe jetzt als Ablenkungsmanöver herhalten muss, weil die Partei von Julia Tymoschenko (und wir befinden uns ja im Wahlkampf) gerade einen schweren Imageverlust durch einen Pädophilie-Skandal einiger Parteimitglieder erlitten hatte. Außerdem eignet sie sich ganz gut dazu, Massenveranstaltungen zu verbieten, was es den Konkurrenten von Tymoschenko sehr schwer macht, eigene Wahlkampfveranstaltungen durchzuführen. Sie selbst hatte ihren Massenauflauf auf dem Unabhängigkeitsplatz und ihre Konzert-Tour gerade hinter sich gebracht. Dann zeigte er mir noch einen YouTube-Clip mit ihr als Beweis für einen Freudschen. Ich glaube aber, dass dieser Ausschnitt genauso gut aus dem Kontext gerissen gewesen sein könnte. Im Video klingt es so, als wäre ihr das Wort "Infektion" herausgerutscht, aber es kann auch sein, dass sie es davor als Metapher eingeführt hatte. Ich bin bestimmt kein Fan, aber anhand dieses kurzen Ausschnitts würde ich persönlich so etwas nicht einfach so unterstellen.

Hier wäre jedenfalls das Video: [deleted]

Der Text dazu lautet: "*Und ich weiß, dass wenn jeder von Euch zu sich nach Hause fährt, ihr einen Teil dieser guten, wundervollen Infektion des Kampfes für die Freiheit in jedes Dorf und in jede Stadt tragen werdet. Werdet Ihr das machen können*?"

Jedenfalls waren R. und ich danach noch essen, und es scheint sich zu beruhigen. Im Lokal hatte nur das Personal Masken. Wieder einmal waren selbstgemachte dabei. Ich glaube, sie sind immer noch ausverkauft. Zumindest konnte die Dame vor mir gestern in der TAS-Apotheke keine bekommen.

Total Destruction of Lungs in Ukraine Fatal H1N1 Cases

Recombinomics, 9 November 2009, 04:22
https://web.archive.org/web/20091112093144/http://www.recombinomics.com/News/11090903/Ukraine_Lungs.html

The symptoms are observed at different stages of disease - a fever with a temperature over 38 C, cough, respiratory disorders. When cough was characterized by negligible allocation phlegm or dry unproductive cough with blotches of blood. All the patients come to hospital on average by 3-7 days of onset, were in serious condition. Period of time from onset to death averaged from 4 to 7 days. In all patients during a hospital for signs of respiratory insufficiency of various degrees, which quickly rose and manifested accelerated respiration rate, shortness of breath and effectiveness of independent breathing. X-ray studies were performed on 1-2 day hospitalization. Most patients experienced a double-headed particles of lower lung lesion, followed by a trend towards total destruction.

The above translation is from an announcement today from the Ukraine Ministry of Health describe 90 fatalities (see map) associated with community acquired pneumonia. The full report included the age distribution, which exactly match distribution reported previously by other countries for swine H1N1. 52/90 fatalities were in the age group of 19-40, followed by 26/90 in the 41-55 age group.

Coughing up blood followed the "total destruction" of lungs again gives a clinical picture of hemorrhagic pneumonia caused by H1N1 swine flu.

However, although the 90 recent fatalities described above are clearly due to H1N1, many reports continue to cite a low number of H1N1 lab confirmed cases, which is more reflective of limited testing than actual cases.

Earlier reports cited pneumonia deaths not associated with the influenza/ARI category and the basis for the classification of approximately half of such deaths into a separate category remains unclear.

The above description of these fatalities increase the need for the immediate release of sequences from H1N1 isolated from the lungs of these fatal cases.

Samples were sent to Mill Hill a week ago and only a minimal description (no "large" changes and no anti-viral resistance) of the sequence data. As the number of reports of sequences with receptor binding domain changes in isolates from lungs of fatal H1N1 cases increase, the need for full and rapid disclosure of sequences from large outbreaks such as the one in Ukraine become a major health care imperative.

THE FLU CASE

Bird Flu Pandemic

The Flu Case, 12 November 2009

https://web.archive.org/web/20100102014837/http://theflucase.com/index.php?option=com_content&view=article&id=1760%3Ahas-the-swine-flu-virus-mutated-to-become-more-like-the-spanish-flu&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Has the H1N1 swine flu virus in Ukraine mutated to become more like the 1918 Spanish flu that killed 50 to 100 million people across the globe? Just like the current H1N1 swine flu virus sweeping the globe, the 1918 Spanish flu was a virus strain of subtype H1N1. Just like the current H1N1 swine flu virus, most of the victims of the Spanish flu were healthy young adults. Now news has come out that the patients that are dying in Ukraine are experiencing the total destruction of their lungs – just like the 1918 Spanish flu.

Recombinomics has posted a translation from an announcement by the Ukraine Ministry of Health that describes what is happening to these patients and how their lungs are being absolutely destroyed by this virus:

The symptoms are observed at different stages of disease – a fever with a temperature over 38 C, cough, respiratory disorders. When cough was characterized by negligible allocation phlegm or dry unproductive cough with blotches of blood. All the patients come to hospital on average by 3-7 days of onset, were in serious condition. Period of time from onset to death averaged from 4 to 7 days. In all patients during a hospital for signs of respiratory insufficiency of various degrees, which quickly rose and manifested accelerated respiration rate, shortness of breath and effectiveness of independent breathing. X-ray studies were performed on 1-2 day hospitalization. Most patients experienced a double-headed particles of lower lung lesion, followed by a trend towards total destruction.

Reports such as this, along with the fact that the WHO has not released the sequences from the samples taken from patients in Ukraine is leading Recombinomics and others to fear that the H1N1 swine flu virus has indeed mutated and become more like the 1918 Spanish flu.

In fact, infectious disease expert Dr. Donald Lau claims that the odds of the Ukrainian pandemic virus being the exact same H1N1 virus that is infecting the rest of the world are extremely low: "The statistical probability of this being the same H1N1 virus are infinitesimally small."

In any event, the situation in Ukraine is quickly becoming worse. As we reported yesterday, almost 1 million people in Ukraine have now reported flu-like symptoms. In addition, 6 health care workers have died and more than 2000 other health care workers are now seriously ill in Ukraine with flu-like symptoms.

But what is most striking is how incredibly similar the virus ravaging Ukraine is to the 1918 Spanish flu. Recent reports from Ukraine indicate that victims of the virus have been bleeding from every orifice. Now consider the following description of the 1918 Spanish flu from Wikipedia:

"One of the most striking of the complications was hemorrhage from mucous membranes, especially from the nose, stomach, and intestine. Bleeding from the ears and petechial hemorrhages in the skin also occurred."

Not only that, but pneumonia has been so prominent in Ukraine that it led many to speculate that it was actually pneumonic plague that was killing people there. In addition, one of the most prominent features of the virus in Ukraine is that it causes massive hemorrhaging and destruction in the lungs.

Considering that, check out how Wikipedia describes the deaths that were caused by the 1918 Spanish flu:

The majority of deaths were from bacterial pneumonia, a secondary infection caused by influenza, but the virus also killed people directly, causing massive hemorrhages and edema in the lung.

So has the H1N1 swine flu virus mutated to become more similar to the 1918 Spanish flu? If not, it sure is acting a whole lot like the 1918 Spanish flu.

And that would be really, really bad news. The 1918 Spanish flu killed approximately 3 percent of the world's population. Tens of millions of people died.

Nearly a hundred years later, humanity circulates around the globe so much faster thanks to our amazing advances in transportation. Therefore, a truly horrific virus could spread to virtually every corner of the globe in record time.

In addition, if the H1N1 swine flu virus has mutated, it is likely that the swine flu vaccine will not do an ounce of good to fight the mutated virus. Instead, many natural health experts are warning that taking the H1N1 swine flu vaccine will fry your immune system and make it even more likely that you will catch the next virus to come along.

Not only that, but reports of adverse reactions to the swine flu vaccine are quickly coming in from all over the globe. In particular, pregnant women who have taken the vaccine (remember they were pushed to the front of the line for the vaccine) are reporting absolutely horrific miscarriage stories. This whole thing is quickly becoming a total worldwide health disaster.

THE FLU CASE

Ukrainian Health Ministry figures on flu raise questions

The Flu Case, 10 November 2009, 08:08

https://web.archive.org/web/20100102004953/http://theflucase.com/index.php?option=com_content&view=article&id=1715%3Aukrainian-health-ministry-figures-on-flu-raise-questions&catid=1%3Alatest-news&Itemid=64&lang=en

The Ukrainian Health Ministry said on November 8th that 155 people had died due to the mysterious flu while nearly a million people – 969.247 – are sick with the flu or an acute respiratory illness. This is nearly four times as many people as six days before. On November 2nd, 255,516 people were reported to have the flu.

According to the figures of the Ukrainian Health Ministry, the number of victims of the mysterious flu, therefore, double every three days.

At this rate, about two million people will be infected by November11th, four million by November 14th, eight million by November 17th, sixteen million by November 20th and 32 million by November 23rd.

MED НОВОСТИ

Михаил Алексеев

Только без паники

MED Новости, 11 ноября 2009, 21:18
https://web.archive.org/web/20091116002821/http://medportal.ru/mednovosti/main/2009/11/11/nopanic/

Вирус A/H1N1, ставший на прошлой неделе доминирующим штаммом гриппа в России и мире, неуклонно распространяется по территории нашей страны. Согласно официальной статистике, сейчас эта инфекция лабораторно подтверждена у 4,5 тысячи россиян. Быстрый рост числа заболевших заставил Россию приступить к вакцинации против нового гриппа на несколько недель раньше запланированного срока. Минздрав и другие ведомства делают все возможное, чтобы убедить сограждан в том, что ситуация с гриппом находится под контролем и причин для паники нет.

Все в норме

По словам министра здравоохранения и социального развития Татьяны Голиковой, уровень заболеваемости всеми разновидностями гриппа и ОРВИ в Российской Федерации находится на уровне прошлых лет, а летальных исходов в первые девять месяцев 2009 года зафиксировано даже *меньше, чем в прошлом году*. Впрочем, доступная в настоящее время статистика ограничивается данными, собранными по сентябрь включительно, тогда как резкий скачок заболеваемости гриппом пришелся на октябрь и начало ноября.

…

Помощь ближним

Несмотря на то, что острый дефицит противовирусных средств ощущается в нескольких регионах России, правительство РФ выразило готовность уже на этой неделе поделиться российским “Арбидолом” с братской Украиной. Уже на этой неделе туда будет безвозмездно направлено 200 тысяч упаковок российского лекарства.

Ситуация с гриппом на Украине действительно тяжелая: с конца октября там зарегистрировано более 1,2 миллиона случаев ОРВИ и гриппа, более 90 тысяч людей госпитализированы, сотни скончались. Так что сейчас украинские власти принимают любую помощь не только от США, Евросоюза и ВОЗ, но и вообще откуда угодно.

По словам Татьяны Голиковой, в будущем Россия, возможно, сможет поделиться с Украиной и своими вакцинами против гриппа H1N1. Один из отечественных препаратов уже проходит регистрацию в украинском Центре иммунобиологических препаратов. Впрочем, учитывая темпы вакцинации в России, к моменту, когда в нашей стране появятся излишки вакцин, украинская эпидемия может уже закончиться.

THE FLU CASE

Stephen Lendman

Suspected Hemorrhagic Pneumonia Outbreak Hits Ukraine

The Flu Case, 11 November 2009, 10:27

https://web.archive.org/web/20100102044323/http://theflucase.com/index.php?option=com_content&view=article&id=1729%3Asuspected-hemorrhagic-pneumonia-outbreak-hits-ukraine-by-stephen-lendman-&catid=1%3Alatest-news&Itemid=64&lang=en

On October 29, the Australian web site zik.com.ua reported that: "Western Ukraine was hit by a severe epidemic of unidentified influenza, tentatively diagnosed by doctors as viral pneumonia. The number of dead has climbed dramatically. Doctors advise Western Ukrainians to stay home and use preventive medicine." https://web.archive.org/web/20091101012920/http://zik.com.ua/en/news/2009/10/29/202374

On October 30, Jane Burgermeister's theflu.com reported that: "More than 30 people have died in the Ukraine as a result of a mysterious new virus that has an affinity for the lungs," according to Swiss reports. Ukraine's Health Ministry said the virus' origin is unknown and showed "no signs of mutating to become more virulent." So far, 40,000 people were reported sick and 951 hospitalized.

https://web.archive.org/web/20091103080745/http://www.theflucase.com/index.php?option=com_content&view=article&id=1459:origin-of-new-virus-in-ukraine-unknown-says-government&catid=1:latest-news&Itemid=64&lang=en

On October 30, healthfreedomalliance.org reported that Ukraine's Health Minister, Vasyl Knyazevych, said two laboratories diagnosed 11 of 33 samples tested as "highly influenza A/H1N1." As a result, he considered declaring a nationwide quarantine, even though western areas alone were affected.

Since October 19, 30 deaths, including one child, from "acute respiratory infections," were reported, at first called SARS (severe acute respiratory syndrome, a serious form of pneumonia caused by a virus). Influenza A virus affects birds and some mammals like pigs.

WHO Fear Mongering

The WHO says Swine Flu is similar to seasonal strains. Most cases are mild, and many people recover unaided. Yet it called the virus "unstoppable" and, on June 11, declared its highest phase 6 alert, saying: "The world is now at the start of the 2009 influenza pandemic." On July 13, it stopped just short of mandating mass vaccinations to halt the pandemic's spread.

On its November 1 "Pandemic (H1N1) 2009" update, it said "more than 199 countries and overseas territories/communities have reported laboratory confirmed cases of pandemic influenza H1N1 2009, including over 6,000 deaths."

On November 3, it reported the outbreak in Ukraine, "confirmed (as) H1N1 (based on) samples taken from patients in two of the most affected regions," and concluded that "most (Ukraine influenza) cases are caused by the H1N1 virus.

Infectious disease expert, **Dr. Donald Lau**, disagrees, saying: "The statistical probability of this being the same H1N1 virus (is) infinitesimally small." He believes a highly virulent new strain is to blame. Public health authority, Dr. Leonard G. Horowitz sees a deadly connection between governments and the drug cartel over dangerous, toxic vaccines.

On You Tube, he recently warned that: "These vaccinations contain highly unstable viruses that easily mutate, because they are 'live active' laboratory mutants that are being administered....People shed these 'live' viruses up to three weeks following vaccination. That means if you haven't been vaccinated, and you get near someone who has and then sneezes, you can get their H1N1 laboratory infection."

He explained that anyone contracting H1N1, from vaccinations or other Swine Flu-infected persons, risks combining it with other internal or environmental viruses, creating a lethal mix that can kill. He expressed great concern about vaccines used to transmit dangerous viruses, capable of mutating into deadly ones, believes this may be happening in Ukraine, and thinks America and other nations may be next.

Ukraine Reports of Overhead Aerosol Spraying

On October 31, Kiev newspaper editors got dozens of calls about light planes doing aerosol spraying during the day. In refuting the claims, the district's Emergency Response office said "no permission had been granted for small aviation aircraft to fly within the city limits." Yet eye-witness accounts from Lviv, Ternopil, and other Ukraine cities said the same thing.

On November 8, the South African web site fto.co.za reported that last June 26:

"Suspicious aircraft were forced to land. A US operated (Russian-made long-range heavy transport) AN-124 changed its call sign from civilian to military which then triggered a response from the IAF (Indian Air Force) upon entering Pakistani air space (forcing) the plane to land in Mumbai while (a) second one was forced down by Nigerian fighter jets that also arrested the crew."

"According to reports, China's People's Liberation Army Air Force contacted the Indian and Nigerian intelligence officials about the presence of these US operated Ukrainian aircraft amidst growing concern that the United States was spreading 'biological agents' in the Earth's atmosphere, which some Chinese officials believed to be an attempt to (commit) mass genocide via the spread of H1N1 swine flu."

These aircraft "were carrying 'waste disposal' systems that could spray up to 45,000kg (nearly 100,000 pounds) of aerial type mist from sophisticated....nano pipes" in the planes' wings - called chemtrails. "Then last week, (aircraft) sprayed (an unknown) substance over Ukraine days before the (mysterious) plague outbreak."

Quarantine and Martial Law Declared

On October 30, president Viktor Yushchenko quarantined nine regions, ordered mobile military hospitals established throughout the country, and was expected to declare martial law. Reports from western Ukraine said a "severe outbreak of UNIDENTIFIED Influenza, (is) suspected by doctors to be a form of viral pneumonia."

On November 4, in a nationwide address, Yushchenko cited:

- an "emergency epidemic situation in the country," caused by "infections of viral origin, including A/H1N1 flu (that are) rapidly spreading across Ukraine;"
- "People are dying; the epidemic is killing doctors;"
- "three pathogens of viral infections came to Ukraine at the same time: two of them are seasonal flu and the third is the A/H1N1; according to virologists, such a combination of infections due to mutation may produce a new, even more aggressive virus;"
- "It is generally known that the only way to prevent any infection is vaccination;" Dr. Viera Scheibner, the world's foremost vaccine expert, calls it the worst way as vaccines often cause the diseases they're designed to prevent;
- "in early October," it was known that "viral infections in the west of the country" were spreading;
- "The current Constitution after alterations in 2004 makes the Government solely responsible for conducting state healthcare policy....(by) my decree I put" the National Security and Defense Council (in charge) of decision-making;"
- "Failure to comply with its orders will immediately result in application to the law enforcement authorities."

In other words, Yushchenko declared martial law. He also ordered a crackdown on political protests, the arrest of public health officials opposed to mass Swine Flu vaccinations and quarantines, arrests of anyone not complying, and a ban on all infection medicines except Swine Flu vaccines.

By November 6, Deputy Health Minister, Zinovy Mytnyk, said "633,877 people (were) suffering from flu and acute respiratory infections," and "95" had died.

On November 7, healthfreedomalliance.org updated the totals to "871,037 Influenza/ARI (acute respiratory infection) cases, 39,603 hospitalized, and 135 deaths, and asked if Baxter released a bioweapon in Ukraine, saying "Evidence appears to suggest" it. It cited a February 24 bloomberg.com report that "Baxter Sent Bird Flu Virus to European Labs by Error (containing) contaminated (virus) samples...." =>

https://web.archive.org/web/20091105021337/http://www.theflucase.com/index.php?option=com_content&view=article&id=1534:has-baxter-international-released-a-biological-weapon&catid=41:highlighted-news&Itemid=105&lang=en

https://web.archive.org/web/20110715234330/http://www.bloomberg.com/apps/news?pid=newsarchive&sid=aTo3LbhcA75I

The problem was discovered when inoculated ferrets in a Czech lab died. Austrian health minister, Sigrid Rosenberger, confirmed that Baxter supplied batches "infected with a bird flu virus." Company spokesperson, Christopher Bona, blamed "human error." Others were skeptical, including Austrian journalist Jane Burgermeister.

On June 10, she filed sweeping criminal charges with the FBI in addition to earlier April 8 ones with the Vienna State Prosecutor's Office against Baxter AG, Baxter International and Avir Green Hill Biotechnology AG, "for manufacturing, disseminating, and releasing a biological weapon of mass destruction on Austrian soil between December 2008 and February 2009 with the intention of causing a global bird flu pandemic virus and of intending to profit from that same pandemic in an act that violates laws on international organised crime and genocide."

Baxter operates Biosafety Level 3 (BLS-3) labs that take strict precautions to assure against accidental H3N2 (human influenza) and H5N1 (bird flu) co-mingling contamination. Letting it happen suggests something more nefarious than an accident.

BLS-3 personnel are trained in handling pathogenic and potentially lethal agents and are supervised by competent, experienced scientists. In addition, these labs have specially engineered design features for added safety.

By combining H3N2 and H5N1 viruses, "*Baxter produced a highly dangerous biological weapon* with a 63 per cent mortality rate. The H5N1 virus is restricted in its human-to-human transmissibility, especially because it is less airborne."

"However when....combined with seasonal flu viruses (easily transmitted by air), a new flu virus is created which is unknown to the human immune system and which will have a severe impact on an unprotected population. A deadly virus of this kind could spread around the world in a short time and (potentially) infect millions (or) even billions of people."

Baxter (via Avir) "distributed (72 kilos of) contaminated (live bird flu) vaccines using false concealment and false labels to 16 laboratories in Austria and....other countries at the end of January/beginning of February, potentially infecting at least 36-37 laboratory staff, who (were) treated preventively for bird flu and ordinary flu." On the same day, 18 Avir employees were as well at Vienna's Otto Wagner Hospital.

Burgermeister cited a Baxter-Avir 2006 contract with Austria's Health Ministry for 16 million vaccine doses in case a bird flu pandemic was declared. This "laboratory incident shows that national and international authorities are not able to fulfill their obligations to ensure the safety of the Austrian people," and indicates they engaged in a cover-up.

"If a pharmaceutical company can breach laws – and almost trigger a bird flu pandemic, which (potentially could spread worldwide) – without being made accountable for it....then there is, de facto, no rule of law on Austrian territory."

She also contends that Baxter's production system, "namely, the use of 1200 liter bioreactors and vero cell technology," meets "the technical criteria to be classified as a secret dual purpose large-scale bioweapon production facility (able to produce) a huge amount of contaminated vaccine material....rapidly."

"If (this) material were added to the 1200 liter bioreactors, it would replicate and infect the entire batch of vaccine material in (it). Contaminated material could (then) be distributed among sections of the population using false labels and secretly marked batches (able to) infect millions of people."

Burgermeister accused high-level Austrian Health and other Ministry officials of knowledge and support of this practice. Otherwise, controls would have prevented it. In June, she named drug

producers Baxter, Novartis and Sanofi Aventis; world agencies, including the WHO, UN, and CDC; and high-level officials in Austria, other European countries, and America.

Did Baxter Release a Bioweapon in Ukraine?

Baxter has a facility in Ukraine. Given the above evidence, it may be behind the current outbreak. A November 1 David Rothscum infowars.com article headlined: "Has Baxter International released a biological weapon," in citing an earlier Huffington Post report on a man named Joseph Moshe, a Mossad biological warfare expert. True or not, he warned, on an August radio program, about "a biological weapon....being made by Baxter International('s Ukraine facility) that would be spread through vaccine and would cause a plague upon its release." Having reported this two months before the outbreak lends credence to his story.

https://web.archive.org/web/20091105021337/http://www.theflucase.com/index.php?option=com_content&view=article&id=1534:has-baxter-international-released-a-biological-weapon&catid=41:highlighted-news&Itemid=105&lang=en

In August, Ukraine was almost influenza free. On October 30, earthtimes.org said only two cases of Swine Flu had been reported. According to fto.co.za, on March 26, reports were that "thousands of Ukrainians refused" to be vaccinated, because of fears about "diphtheria, mumps, polio, hepatitis B, tuberculosis, (and) whooping cough among others. Health officials said (this) could lead to disease outbreaks...." Perhaps unleashing a "biological weapon" is how to convince them and millions elsewhere.

Rothscum confirmed Moshe's credentials, noting that "massive numbers of microbiologists have been dying bizarre deaths." Among them:

- Stephen Lagakos, Professor of Biostatistics and AIDS researcher at Harvard's School of Public Health, died in an October auto collision;
- Malcolm Casadaban, reknown molecular geneticist, died of plague in September;
- Wallace Pannier, noted germ warfare scientist, died in August of respiratory failure;
- August "Gus" Watanabe, former Eli Lilly and Company Executive Vice President of Science and Technology and former head of its Research Laboratories, died of apparent self-inflicted wounds from a .38-caliber handgun; a note left behind cited depression over his daughter's death;
- Caroline Coffey, Cornell University post-doctoral biomedicine researcher, died in June from massive cuts to her throat; and
- Nasser Talebzadeh Ordoubadi, a Mind-Body-Quantum medicine pioneer and discoverer of an antitoxin treatment for bioweapons, died in February of "suspicious" causes.

On November 7, theflucase.com asked: Is the Ukraine outbreak "the plague? A mutated virus? Or is the plague the cover for introducing a mutated virus?" Citing the South African web site fto.co.za., it wondered if the Ukraine Swine Flu strain "might have mutated (to) pneumonic plague."

It reported Ukraine's Deputy Minister of Health saying his nation has a different H1N1 strain than the rest of the world because of how many were infected so fast. Other officials disagree and suggest this one may have mutated to something else because it "has a much bigger rate of filling the lungs with blood....The plague or virus in the Ukraine has 10 times the mortality rate (attributed to) normal swine flu."

However, unconfirmed reports are that "people are going on as normal....they also say this is fear mongering" to promote voluntary vaccinations. "Everyone is waiting for the gene sequences which will confirm whether this has been hyped up, a real mutated H1N1, or just bad (Ukraine) health services." Perhaps exaggerated illness and death reports to stoke fear and be a pretext for what followed.

Ukraine is now under martial law. Civil liberties are suspended. By government edict, anyone may be criminally prosecuted. Scheduled January elections may be delayed or cancelled. Public demonstrations are banned. Political opponents are prohibited from traveling in quarantined areas. Borders are partially closed. Mandated vaccinations are coming. WHO fear-mongering is hyping the danger. A month before the outbreak, it took part in a bioterrorism plague exercise. On November 7, Lake of the Hills, IL police conducted their own against pneumonic plague as part of the McHenry County Department of Health's emergency planning.

Burgermeister suggests that Baxter, the: "WTO and the international corporate crime syndicate that funds them may have decided they could go ahead with their plan to trigger a pandemic in Europe and the USA because the public awareness of the dangers of the vaccine has become too great, not least as a result of WHO and Baxter being caught contaminating 72 kilos of vaccine material with the live bird flu virus in February."

Opposition to Vaccinations in Europe

Across the continent, opposition is widespread. Few are showing up to get it. On November 7 in Paris, a public demonstration against them was held. As of November 5, less than 0.1% of the French population was inoculated despite a mass vaccination campaign. 90% of Greek health workers oppose them. Reports from Portugal say vaccine centers are nearly empty, and doctors and nurses won't take them. Sources expect a "revolution" if they're mandated.

A mid-October Der Spiegel article reported an "open rebellion" among general medical professionals and child physicians across Germany over dangerous Swine Flu vaccines. Dieter Ludwig, drug commission chairman of the German medical profession, said health authorities colluded with drug companies to promote them.

In Denmark, most public officials and healthcare workers won't take them, citing the danger and saying H1N1 is no different from seasonal flu. Throughout Scandinavia, sentiment is the same with up to 75% opposition. In Sweden, as few as several thousand have gotten them. Across the continent also, in the Netherlands, Spain, Belgium and elsewhere. Also large segments of the US, Canadian and UK populations voice strong opposition. Open protests are occurring in Austria. In other countries as well. Millions know the toxicity and won't touch them. Ukraine's outbreak may be a counteroffensive to force them, first there, then globally.

Ukraine Outbreak Spreads

On November 6, innworldreport.net headlined, "Pneumonic Plague Outbreak in China Follows Outbreak in Ukraine." The town of Ziketan (population 10,000) reported two deaths and a dozen others infected. The "area inside a 17-mile radius" was quarantined to contain it. The "highly contagious disease, one of the most virulent and deadly diseases on earth, (is) usually fatal within 24 hours. It attacks the lungs and kills nearly everyone who catches it unless treated rapidly with antibiotics."

On the same day, **Belarus President Alexander Lukashenko** called the panic over Swine Flu artificially created by drug companies. He urged people not to panic, and said authorities are monitoring the situation in neighboring Ukraine. Ten deaths were reported in the Minsk, "preceded by flu-like symptoms."

Radio Free Europe/Radio Liberty disseminates US propaganda in 20 countries, including Russia, Ukraine, Iran, Iraq, and Afghanistan. On November 4, it headlined, "Swine Flu Fears Spread from Ukraine to Afghanistan," then reported, true or false, incidences showing up in Iran, Belarus, Turkmenistan, Serbia, and other Balkan countries. "Afghanistan has declared a nationwide public health emergency and closed all educational institutes for three weeks."

On November 2, the Chinese web site sina.com reported that authorities in a southeast Bulgarian district declared an A/H1N1 epidemic, according to local media accounts. The "sick rate" rose "to 200 per 10,000 people," and in some towns is approaching epidemic levels. A later report said 210 per 10,000. Two deaths were reported, and Bulgaria's chief health expert, Tencho Tenev, said "at least two million Bulgarians, or 30 percent of (the) population, could become infected with the flu virus over the coming months."

On November 9, thebirdflupandemic.com headlined, "Russia, Belarus and Bulgaria On The Verge Of A Flu Epidemic As Cases in Ukraine Near 1 Million."

Same day Ukraine reports said 1,031,597 people are sick with flu-like symptoms, 52,742 have been hospitalized, and 174 people have died. On November 6, Russia's Chief Health Official, Gennady Onishchenko, said most regions in the country "are on the verge of a flu epidemic."

"Disturbing reports are beginning to surface in western Europe. In Austria, special army units based in Korneuburg (where Baxter's facilities are located), have been conducting pandemic emergency exercises and quarantining patients in hospitals. Are they expecting something to happen?"

WHO "Whole-of-Society Pandemic Readiness Guidelines for Pandemic Preparedness and Response in the Non-Health Sectors"

Prepared in April 2009, the same month Swine Flu was reported in Mexico, it was revised in July and now easily accessed coincidently with the Ukraine outbreak. Its aim is:

"to prepare the whole of society, beyond the health sector, for pandemic influenza....including public and private sector organizations and essential services."

The flucase.com says it "outlines how WHO will take over a country's essential services, including water and sanitation; fuel and energy; food; health care; telecommunications; finance; law and order; education; and transportation under the pretext of a pandemic emergency."

The "guidelines" state:

"National inter-ministerial pandemic preparedness committees should map out the central government's roles, responsibilities, and chain of command and designate lead agencies," answerable to the WHO that's perhaps enforceable during a "health emergency." It may work like this.

Vaccine law **attorney, Alan G. Phillips** says:

"....underlying laws.... allow states to mandate vaccines in an emergency....throw out exemptions, (and) impose quarantines and isolation outside of our homes."

US laws are similar. They can mandate vaccinations and let states isolate and quarantine influenza victims if authorities call the disease infectious and life-threatening. Under the 2006 Public Readiness and Emergency Preparedness (PREP) Act, the HHS Secretary may declare any disease an epidemic or national emergency requiring mandatory vaccinations, quarantine, or other protective measures. It's a short step to empowering WHO with authority over most nations in short order.

Its "guidelines" also want Defense Ministries to designate military assets to enforce vaccinations and quarantines under pandemic conditions. They also say:

"Ministries of Justice should consider what legal processes could be suspended during the pandemic and make alternate plans to operate courts" while it continues.

According to theflucase.com:

"leaked (French) documents show that the Minister of Justice has ordered the suspension of the most basic rights, and people can be incarcerated for up to six months without having to appear before a judge in a pandemic emergency."

Might America and other nations order similar measures under a "pandemic emergency," real or bogus.

Internal 2006 IBM Document Reveals Advance Knowledge of a Planned Pandemic

Titled, "Services & Global Procurement pan IOT Europe, Pandemic Plan Overview," it was distributed to upper-level management in France. It predicted a "100% chance (of a) planned (pandemic) occurring within the next 5 years," covering quarantines and operational procedures to be taken after an official WTO announcement. This document suggests what many believe - that governments and the drug cartel, in collusion with the WTO, orchestrated the current crisis, choosing Ukraine as the lead target. The situation there deserves close monitoring because of what may happen globally.

Advance Pandemic Warning and Early Preparations .

Replikins, Ltd. is a small Boston-based biotech firm that "develops and markets....predictive products and vaccines....based upon the company's discovery of Replikins, a new group of peptides related to the rapid replication function in viral and other diseases (capable of) predicting the emergence of virulent strains of particular diseases."

On April 7, 2008, a year before the reported Mexican H1N1 outbreak, it published a "FluForecast" stating the following:

"Replikins, Ltd. has found that the Replikin Count of the H1N1 strain of influenza virus has recently increased to 7.6 (plus/minus 1.4), its highest level since the 1918 H1N1 pandemic....A rising Replikin Count of a particular influenza strain, indicating the rapid replication of the virus, is an early warning which has been followed consistently by an outbreak of a specific strain. The current increase appears to be specific to H1N1; there was a concurrent 80% decline in the Replikin Count of (seasonal) H3N2, for instance."

"The current H1N1 appears to be rapidly replicating simultaneously in the US and Austria....However, the same virus replikin structures detected by FluForecast software in all three previous pandemics, namely 1918 H1N1, 1957 H2N2, and 1968 H3N2, as well as in H5N1 (Avian Flu), have not yet been detected in the currently evolving H1N1."

In an October 24, 2007 press release, the US Treasury Department discussed the "preliminary results of the industry-wide pandemic flu exercise....More than 2,700 organizations registered to participate anonymously (which) began in September and ran for three weeks." Involved were banks, insurance companies, securities firms and exchanges, and state and federal regulators.

"The exercise simulated a pandemic wave with a peak absenteeism rate of 49 percent....President Bush directed Treasury in May 2006 to coordinate with the banking and finance sector to better prepare its response to a pandemic crisis."

On December 12, 2007, FEMA Region I (for New England) hosted a joint federal-state exercise "to strengthen contingency plans for an influenza pandemic. Operation PANEX 07 is the first functional exercise of its type in this country designed to determine best practices for a coordinated multi-agency response to an outbreak."

Participating agencies included the Department of Homeland Security (DHS), Health and Human Services (HHS), and Defense (DOD) "in partnership with their counterparts in the six New England states."

On July 28, 2009, CNN reported that the Pentagon will "establish regional teams of military personnel to assist civilian authorities in the event of a significant outbreak of the H1N1 virus this fall, according to Defense Department officials....The plan calls for military task forces to work in conjunction with (FEMA)."

Consider the implications. On October 23, Obama declared a H1N1 national emergency. The Pentagon will be in charge if conditions warrant it. Civil liberties may be suspended. Martial law may be declared. Mandatory toxic, dangerous vaccinations may be ordered, known to cause auto immune diseases ranging from annoying to debilitating to life-theatening. The situation in Ukraine bears watching. It may signal what's soon heading everywhere.

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

Population Reduction: Globalist Endgame Begins?

SkyWatch Canada / Infowars, 12 November 2009

https://web.archive.org/web/20100102111945/http://www.infowars.com/population-reduction-globalist-endgame-begins

Ukraine's Prime Minister Yulia Tymoshenko wears a protective mask as she visits a hospital in Ivano-Frankivsk November 3, 2009.

On October 30th, 2009 editors of local papers in Kyiv, Ukraine received a flood of phone calls from citizens reporting low flying aircraft spraying an unknown aerosolized substance over L'viv, Ternopil and other cities. On October 27th of the Ukrainian media broke the story that on October 26th, in Ternopil an unknown flu had killed seven people, and that over the past few days about 6 thousand people had sought out medical attention in regards to flu like symptoms.

From this first report through to the 9th of November over 1 million people inside the Ukraine people have contracted some form of flu like illness. This is almost double the number of 'confirmed' H1N1 cases worldwide in all other countries. There have also been over 155 deaths reported due to influenza during this time. This outbreak is unprecedented yet it has received minimal coverage in the western media. It just seemed to get lost amidst all of the swine flu coverage, and written off as just more cases of H1N1 before any lab samples had been processed.

In the Ukrainian and Russian media however the outbreak has been treated more seriously and has been referred to as 'pneumonic plague'. On October 29th, a report came out of Ukraine describing the deaths of 6 young people in the Ivano-Frankivsk Oblast. After the autopsies were performed it was recorded that the cause of death in these individuals was "severe hemorrhagic pneumonia".

Also unconfirmed reports from bloggers in the Western Ukraine that doctors were seeing that this was a new form a flu that killed much faster than the regular H1N1 virus. Soon Ukrainians started to panic, and the stores emptied of masks and all forms of flu medication. Even onions, garlic, and lemons became scarce in so me cities.

As a countermeasure to this outbreak 9 Oblasts (cities) were placed under quarantine by the government. The WHO sent a team of experts to take samples of this new flu and send them back to the Mill Hill lab in London to determine the gene sequences of this flu, and to discover if this was in fact the same Californian/Mexican A/H1N1 virus. On November 3rd the WHO announced that the samples had been received at Mill Hill, yet almost a week later there have been no reports issued and no gene sequence data released. If these were typical samples it seems that an announcement would have been made already. The silence is deafening.

It should also be noted that rumors of the doctors being told not to disseminate any information about the new flu cases that would incite any panic, were later confirmed by statements made by the Ukrainian government that police have been told to confiscate hospital reports on patients who have recently contracted the flu.

All things considered, it would not be a surprise if this unidentified virus turned out to be far more serious than the mild A/H1N1 circulating the globe. Two unconfirmed reports, one in 2002 and one in 2009 by alleged government insiders revealed that at some point that live 1918 Spanish flu would be released on a large scale in the form of a vaccine, for the purpose of mass genocide. The August 2009 report by Joseph Moshe revealed that he was involved with Baxter in a plan to release the 1918 virus in the Ukraine.

Not only was it confirmed that he was a microbiologist, his claim was also substantiated by the current Ukrainian outbreak. After a number of deaths in September the Ukrainian government "banned the use of the H1N1 vaccine. This would make it quite difficult to release the 1918 virus as described by Joseph Moshe."

It now seems as though the vaccine ban will be lifted and h1n1 vaccines will be forced on the people of Ukraine. On November 9th the "Globe and Mail" published a story that revealed, despite "previous claims" by the Ukrainian Government that they had not authorized the use of aerosolized medication on the public as a response to the outbreak, that they in fact "sprayed the city with the necessary products".

Was this in fact medication or disinfectant? If so why would the government deny this? “Was the spraying in fact a release of the mystery flu? Was the original intention to release it via the vaccine? Was the aerosol release the plan B after the Ukrainian government banned the use of the vaccine?

A blog post from a Lviv resident claimed that his mother who works for the city council received a text message the night of Oct 29th from a colleague warning her to keep her windows closed as something was to be sprayed. The context wasn’t crystal clear. It could have been a warning regarding a street disinfecting procedure as is often done during typhoid outbreaks. The government’s denial is not irrefutable proof of a bio-attack, but it is suspicious.

As reported by SkyWatch Canada on September 15th , the frequency of low flying aircraft with unusual flight patterns have caught the attention of Canadians living in the Nation’s Capital. Is there a chance that Canadians are being acclimated to these types of flight patterns for a future bio-release?

In 1994 such an event took place in the town of Oakville, Washington where there were confirmed reports of a clear gel like substance raining form the sky and making residents horribly ill.

Readers should also be reminded of the report given on the Power Hour radio show in March 2009, about truckloads of “bird flu” being delivered throughout America to underground missile silos orchestrated by the department of homeland security.

Several of those loads were delivered into the back of a military C-130 (an aircraft often equipped with an aerosol dispersal system).

Was this multi-million dollar operation conducted for the purpose of spreading the mild and basically insignificant H1N1 demi-flu ? Or has the final phase of the operation yet to occur? Has the event to justify the recent American National Emergency yet to occur? Will the CDC finally make use of their scores of mass graves and plastic caskets? Will the military be deployed to put the country under pandemic lockdown, as we have seen in the Ukraine? Far too much has been put into the H1N1 fiasco for it to amount to a mere outbreak of the common cold. It seems like many pieces of a plan have been put in place. Will the NWO put the people in check? Will the virus 'Mutate'? Is this the beginning of the Globalist Endgame of population reduction ?

There are reports now coming from Romania, India, Bulgaria, Belarus, Turkey, Norway that the rate on increase of flu is increasing rapidly. In Norway foe example 300,000 residents contacted the flu in a single week. Whatever disease has been released is moving across Europe fast. This bug has spread too widely to be a Ukrainian election scam.

Readers should note that just before the outbreak in Ukraine, the government was running pneumonic plague drills. In early November, there were also pneumonic plague drills being run in Illinois. Connect the dots. Notable there have also been reports of heavy supply and personnel movement in and out of known D.U.M.B.s (Deep Underground Military Bases) very recently. According to an unconfirmed report the parking lots of these bases are full and haven't been this full since just after 911. What is going on? Will this fast moving disease be released in America? Listen for low flying aircraft. Shut your windows at night. Stock up on colloidal silver, antibiotics and high quality vitamins. Please watch the skies!

{Matt Zuvela}

Containing illness

Deutsche Welle, 12 November 2009
https://www.dw.com/en/eastern-europe-on-alert-as-suspected-swine-flu-cases-rise-in-ukraine/a-4883012

While Ukraine continues to combat what the UN health agency has called a "rapidly evolving" influenza outbreak, governments in the region have stepped up efforts to keep the virus from crossing the border.

Ukraine's European neighbors took action to prevent the fast-moving flu from spreading outside the country, where the Ukrainian Health Ministry reported at least 174 deaths and more than 1 million infections due to acute respiratory illness as of Tuesday.

The World Health Organization (WHO) assumes the majority are swine flu cases, according to a statement.

Slovakia, which reported its first swine flu death on Friday, announced it would close most road crossings in the east along its shared border with Ukraine, while Russia plans to examine people entering the country from Ukraine at checkpoints along its western border.

The decision to shut down border crossings in Slovakia goes beyond WHO guidelines for combating swine flu, which do not advocate travel restrictions and border closures.

"This is the flu," Dr. David Mercer, head of WHO Europe's communicable diseases unit, told Deutsche Welle. "Efforts at containing it are not going to succeed."

The WHO urged caution before another potential surge in infections in Ukraine, though new reports cite a drop in new cases. Dr. Mercer called such predictions "premature."

"We are expecting, in fact, that there will be an increase in cases and a fairly high disease burden for weeks," he added.

Ukraine's call for help

Polish Prime Minister Donald Tusk appealed to the European Union to provide aid for Ukraine in a bid to contain the outbreak. Poland borders western Ukraine, a region that has seen the biggest spike in "influenza-like illness."

"A team of EU experts are in Ukraine to oversee the delivery of the EU assistance," European Commission health spokesperson Nina Papadoulaki told Deutsche Welle.

The Commission is in regular contact with the EC delegation in Kyiv and WHO Europe, and Papadoulaki said member states have set up several meetings to address the situation.

Both Slovakia and Poland have responded to Ukrainian President Victor Yushchenko's request for medical supplies.

Ukraine's government has already taken steps to curb the spread of swine flu, including school closures, travel restrictions and cancellations of public gatherings. Officials are also contemplating full or partial quarantines across the country.

At the request of the Ukrainian Health Ministry, the WHO dispatched a nine-person team to areas hardest hit by what the agency suspects is the H1N1 swine flu virus. Experts were sent to Lviv and Zhytomyr, a city west of the Ukrainian capital of Kyiv where almost 20,000 cases of acute respiratory illness were reported during the first week of November.

On Tuesday, Ukraine's deputy health minister confirmed 67 cases of swine flu and 14 deaths due to the virus.

Eastern Europe by the numbers

The move coincides with WHO reports of "increasing and active transmission" of swine flu across Northern and Eastern Europe. Belarus and Bulgaria were among 10 European countries reporting high H1N1 pandemic activity in an update released Monday by WHO Europe.

In Moldova, 615 suspected H1N1 infections were reported as of Monday, as well as three deaths, according to statistics collected by the European Centre for Disease Control and Prevention (ECDC)

The WHO expects at least 80 percent of viral influenza to be caused by H1N1 this winter, according to Dr. Mercer, who said the virus is replacing seasonal flu strains. "We don't expect that to change during this season at all," he told Deutsche Welle.

A region at risk

Harsh winter conditions and less-developed health care systems could heighten the risk of pandemic influenza in Eastern Europe. "Health systems there might not have as many resources as in Western Europe," the WHO's H1N1 spokesperson Gregory Hartl told Deutsche Welle.

Plans to dispatch WHO teams to other Eastern European countries would happen on a "one-to-one basis," Hartl said, depending on requests by individual governments.

A WHO statement praised Ukraine's openness in reporting the recent outbreak, which is seen as a potential "early warning signal" and model for how the virus might behave in countries throughout Eastern Europe during an early start to the flu season.

MIGnews media international group

Doctors learned why Ukrainians dying!

MIGnews.com.ua, 13 November 2009, 14:24
https://web.archive.org/web/20091115093350/http://mignews.com.ua/en/articles/378759.html

All victims of the virus in Bukovyna (22 people at the age of 20-40) died not from bilateral pneumonia, as was previously thought, but as a result of viral distress syndrome, i.e the total destruction of the lungs.

At first the cardio-pulmonary insufficiency comes, and consequently cardiogenic shock is developed, which causes cardiac standstill and death, told the chief of bureau of the Chernivtsi regional forensic examination, doctor of science, Professor Viktor Bachynsky, UNIAN reports.

"During a bilateral pneumonia some morphological picture is observed. As of data of deaths, there is no such morphological picture. The virus, which causes death, is very aggressive, it does not strike the trachea, but immediately gets into the lungs and causes heavy swelling and solid hemorrhage. Mixed types of parainfluenza and influenza A/N1N1 lead to this state. This is a very toxic strain, which has not yet answered to the treatment of the Ministry of Health", - said Viktor Bachinsky.

According to him, there is a need to change the treatment standards, because those which were used earlier, resulted in nothing – doctors failed to save all people infected with the virus in the reanimation. The belt ventilators did not help also.

For this reason, a group of professors of Chernivtsi Medical University appealed to the Ministry of Health and National Security and Defense Council with a demand to review the standards of treatment of patients in Bukovyna. Scientists-morphologists sent to Kyiv reports, studies and analysis of critically ill patients and people who died of virus.

Viktor Bachinsky noted that the virus is extremely toxic, it is able to penetrate not only through respiratory apparatus but also through the eyes. Chernovtsy scientists recommend in any case use masks and even wear protective spectacles. An important condition to prevent deterioration of the situation is also the observance of quarantine regime.

06:19 p.m. Ministry of Health does not consider it is necessary to publish data on the number of confirmed cases of influenza pandemic in the laboratory. "Ukraine is in the A/N1N1 influenza pandemic, and now it does not matter how many of these cases will be detected, we should treat everybody equally," - said Deputy Minister of Health Vasyl Lazoryshynets at a briefing on Friday.

Vasyl Lazoryshynets also reminded that in Ukraine since the beginning of the epidemic 1,25 mn people became ill with pandemic influenza, influenza and acute respiratory diseases, including 61,000 people - over the past day, which is by 8,500 less than the previous day. 65,615 people are treated in hospital, including 392 - in the reanimation, 60 have artificial pulmonary ventilation.

Since the beginning of the epidemic in Ukraine 239 people died, including 26 people during the last day, most of them are in the Ivano-Frankivsk, Chernivtsi, Lviv and Ternopil Regions. He also said that according to the laboratory data, 14 people died of pandemic influenza, Interfax-Ukraine reports.

06:25 p.m. To date, swine flu in Ukraine is dominant, but not the only strain, said the head of mission of the World Health Organization in Ukraine Yukka Pukkila.

Yukka Pukkila said that the strain of pandemic virus is detected in 22 cases of 34 samples sent to the control laboratory, which collaborates with WHO in London.

At the same time, Yukka Pukkila stressed that, besides Californian flu in Ukraine there is a large number of varieties of acute respiratory viral diseases and many other viruses that infect the respiratory system, reports Liga.

KYIV POST
UKRAINE'S GLOBAL VOICE

http://www.marketoracle.co.uk/Article15015.html

Latest reports of what is being called a deadly Swine Flu outbreak in Ukraine according to on sight reports appear to be a political concoction by a threatened government to avoid election defeat and possibly declare martial law. The details indicate how convenient the current WHO "Swine Flu" H1N1 "pandemic" scare is for regimes in trouble.

Worldwide media reports in recent days have painted a picture of Ukraine as being under the Black Plague or worse. One of the most egregious panic-mongers has been Pittsburgh Swine Flu "mapper" Dr Henry Niman who earlier falsely predicted H5N1 Avian Flu would mutate into a deadly human-to-human pandemic. It didn't.

Niman's map of the spread of alleged H1N1 Swine Flu since April has given WHO, the US Government and CNN and major media a convenient graphic to create the image of a new type of "bubonic plague" threatening mankind unless we react with massive doses of untested vaccines from such unscrupulous pharma bigs like GlaxoSmithKline or Novartis or Roche with its dangerous Tamiflu drugs.

Early on Niman reported about events in Ukraine: "The rapid rise in reported infections, hospitalizations, and deaths in the past few days raise concerns that the virus is transmitting very efficiently the spike in fatalities and the frequency in hemorrhagic cases in Ukraine have raised concerns." Niman added the alarming note, "The number of infected patients has almost doubled to just under million, compared to the report two days ago."

That's pretty scary stuff. It conjures images of the reports of the Black Death in 1348 which is said to have killed up to 60% of Europe's population. Though that history has been challenged, the image as well as the equally terrifying if incorrect panic image of the so-called Spanish Flu of 1918, are being applied in Ukraine.

Reality check?

The WHO, the de facto criminal organization responsible for declaration of the H1N1 Pandemic last summer, allowing Governments like the USA and Ukraine to declare martial law and a national state of emergency, suspending all rights and imposing arrests and detentions, has validated the dubious Ukraine claims of out-of-control spread of Swine Flu. A WHO press statement November 3 declared, "Laboratory testing in Ukraine has confirmed pandemic H1N1 influenza virus in samples taken from patients in two of the most affected regions. As the pandemic virus has rapidly become the dominant influenza strain worldwide, it can be assumed that most cases of influenza in Ukraine are caused by the H1N1 virus."

The WHO added, "The outbreak in Ukraine may be indicative of how the virus can behave in the northern hemisphere during the winter season, particularly in health care settings typically found in Eastern Europe. Given the potential significance of this outbreak as an early warning signal, WHO commends the government of Ukraine for its transparent reporting and open sharing of samples."

The samples have been sent to the WHO Mill Hill Influenza Reference Lab in London, not exactly inspiring confidence in a scientifically honest report given the record of UK health authorities in manipulating data to please the vaccine giants like GlaxoSmithKline.

WHO "strongly recommends early treatment with the antiviral drugs, oseltamivir or zanamivir, for patients who meet treatment criteria, even in the absence of a positive laboratory test confirming H1N1 infection." That means Tamiflu, the highly dangerous drug whose major shareholder includes former Pentagon head Don Rumsfeld. And it means GlaxoSmithKline, maker of the reportedly equally dangerous rival Relenza drug. The drugs produce precisely the symptoms of severe lung complications found in flu and in some cases have reportedly caused death.

Ukrainian election geopolitics

The bizarre developments in Ukraine over the past two weeks are being blamed inside the country on intense Ukrainian election politics. In four months national elections in Ukraine are due. Among rival candidates are Prime Minister Yulia Tymoshenko and her chief rival, Arseniy Yatseniuk.

Since Washington financed and organized the 2004 Orange Revolution that brought a pro-NATO Victor Yushchenko in as President, Ukraine politics has been a geopolitical tug-of war between Moscow and Washington. How the current political games around allegations of H1N1 panic play into that tug of war is not yet clear.

The recent speech in Warsaw by Vice President Joe Biden offering Poland and the Czech Republic a "new and improved" version of US anti-missile defense against Russia only four weeks after Obama announced the US was backing out of a controversial earlier missile defense plan for the two eastern European countries underscores the shambles of US strategic policy towards Russia. Russia has been quick to take advantage as might be expected, as a US missile shield on its borders, as I detail in Full Spectrum Dominance: Totalitarian Democracy in the New World Order, gives the US a long-sought nuclear primacy over its only potential strategic rival on the planet. At that point the resistance of the rest of the world to incalculable or objectionable US policies, whether in Iraq, Afghanistan, Georgia or wherever, becomes moot.

It's clear Moscow has been working quietly to bring Ukraine, an original part of Kiev Rus, and a strategically essential part of the Russian economy, back into a more friendly "NATO-free" relationship after five years of Orange Revolution chaos in Ukraine under Yushchenko.

Yatseniuk, a 35 year old former banker and aide to Washington's darling, President Viktor Yushchenko, has charged that Tymoshenko is deliberately fostering unnecessary panic in order to impose martial law and suspend elections that she might well lose to Yatseniuk.

There definitely are political games going on by one or another faction in the economically devastated Ukraine. Oleksandr Bilovol, Ukraine's Deputy Minister of Health, claims the outbreak of flu cases in Ukraine has been essentially contained in 11 out of 25 Ukrainian regions, with the number of people allegedly stricken with H1N1 only 15% higher than figures reported in previous years. "Figures in other the regions are in line with 2007 and 2008," Bilovol said. As well the number of reported deaths is also in line with deaths annually attributed to ordinary influenza.

Tymoshenko declared the outbreak as the threat of the third level the highest possible to unlock spending of up to 3 billion hryvnias to combat the swine flu. Among measures imposed by the decree include shutting down schools and public gatherings for three weeks across Ukraine, with the government also considering introducing restrictions on movement of people between the regions.

Yatseniuk said the ban on public gatherings spreads fear and panic helping Tymoshenko to promote herself on television, while hindering other presidential candidates to campaign.

Yatseniuk is Tymoshenko's biggest rival as both compete for votes in western regions of Ukraine. He is perhaps the only candidate that may challenge Tymoshenko in the first round of vote on January 17, 2010 to enter the runoff with opposition leader Viktor Yanukovych.

Yatseniuk said the panic spread by the government helps overshadow issues politically damaging to Tymoshenko, including pedophile and the murder scandals involving Tymoshenko lawmakers, and Ukraine's dismal economic performance.

Prime Minister Tymoshenko, whatever the real facts of the case, is using the WHO Swine Flu panic scenario to the hilt. In a recent statement, she stated, "We cannot relax even for a moment because the World Health Organization predicts two more waves of flu, including the bird flu, are expected in Ukraine. There is no alternative to vaccination. The entire world is going this way" A day earlier she admitted she was not vaccinated and that she prefers "like all other people" plans to rely on garlic, onion and lemon as a way of preventing the flu.

Ukraine Parliament Speaker Volodymyr Lytvyn accuses Tymoshenko as well, declaring, "You've organized the flu epidemic in order to avoid responsibility for not supplying heat to houses, schools, higher educational establishments, and kindergartens," he said in Parliament. And Orange Revolution President, Yushchenko has declared there was no reason for declaring an emergency in Ukraine. "There are no such reasons," Yushchenko said. "I am not a supporter of measures that freeze the country, restrict its operation to levels that is hard to justify."

Ihor Popov, Deputy Chief of Staff to Yushchenko, said that in case of emergency the election, which is due on Jan. 17, 2010, would have to be "rescheduled."

Germany joins Swine Flu corruption

Not only is the Ukrainian government apparently using fears of Swine Flu pandemic to change the domestic political calculus, and President Barack Obama using the fears to impose an unnecessary state of emergency. Now it comes out that the responsible German health authorities are caught in a corrupt conflict of interest with the very pharma giants profiting from government decisions on "anti-swine flu" vaccines.

The recent issue of the German weekly Der Spiegel, reports that members of the European Scientific Working Group on Influenza (ESWI), which claims to be an independent scientific advisory body advising EU member governments on policies regarding H1N1 influenza, is anything but independent. It's being financed by Big Pharma. ESWI claims it brings together scientific "key opinion leaders in influenza." However the sole financial backers are 10 pharmaceutical companies, including GlaxoSmithKline – manufacturer of the German swine flu vaccine – and Roche – producer of the antiviral drug Tamiflu.

The group lists Walter Haas as one of its scientific advisors. Haas coordinates Germany's flu pandemic preparedness measures at the Robert-Koch-Institut (RKI), the federal institute for disease research. ESWI portrays itself as an independent group of scientists. But even the organization's own statute tells a different story, describing its role as advising politicians and health authorities on "the benefits and safety of influenza vaccines and antivirals" and initiating "a policy for antiviral provisions."

The degree of fraud, deceit, official coverup and outright criminal endangerment of the broad population by the current Swine Flu hysteria is seemingly without precedent.

Ukraine, WHO and the Geopolitics of Swine Flu Panic

PrisonPlanet, InfoWars, 18 November 2009
https://web.archive.org/web/20091122193909/http://www.infowars.com/ukraine-who-and-the-geopolitics-of-swine-flu-panic/

Latest reports of what is being called a deadly Swine Flu outbreak in Ukraine according to on sight reports appear to be a political concoction by a threatened government to avoid election defeat and possibly declare martial law. The details indicate how convenient the current WHO "Swine Flu" H1N1 "pandemic" scare is for regimes in trouble.

Worldwide media reports in recent days have painted a picture of Ukraine as being under the Black Plague or worse. Pittsburgh Swine Flu "mapper" Dr Henry Niman had earlier predicted that H5N1 Avian Flu would mutate into a deadly human-to-human pandemic. It didn't.

Niman's map of the spread of alleged H1N1 Swine Flu since April has given the WHO, the US Government and CNN and major media a convenient graphic to create the image of a new type of "bubonic plague" threatening mankind unless we react with massive doses of untested vaccines from Big Pharma.

Early on Niman reported about events in Ukraine: "The rapid rise in reported infections, hospitalizations, and deaths in the past few days raise concerns that the virus is transmitting very efficiently …the spike in fatalities and the frequency in hemorrhagic cases in Ukraine have raised concerns." Niman added the alarming note, "The number of infected patients has almost doubled to just under ½ million, compared to the report two days ago."

That's pretty scary stuff. It conjures images of the reports of the Black Death in 1348 which is said to have killed up to 60% of Europe's population. Though that history has been challenged, the image as well as the equally terrifying if incorrect panic image of the so-called Spanish Flu of 1918, are being applied in Ukraine.

Exact information about what is really taking place in Ukraine is far from easy. The country is one of the most politically complex and economically distressed states in Europe. One possible hypothesis, yet to be verified, emerges from the writings of Dr Lawrence Broxmeyer MD.

Broxmeyer suggests that the WHO and CDC wish to divert attention from a worldwide epidemic of tuberculosis, while focusing attention on flu instead. Indeed recently the WHO changed its categories of causes of death to lump death from influenza in the same group as death from tuberculosis and other pulmonary disease. Given the present Swine Flu hysteria, any pulmonary death seems to be reported as "death from H1N1 influenza." In a passing note the report typically notes the patient also suffered from lung problems.

Broxmeyer states, "Both the World Health Organization (WHO) and the Centers for Disease Control (CDC) are fully aware of a far more serious and ongoing tuberculosis Pandemic in the world today. Yet they choose to downplay the link, disregarding the similar flu-like symptoms tuberculosis often begins with. WHO freely admits that there were approximately 1.8 million deaths from tuberculosis in 2007, the most recent year for which data are available as well as that presently about one-third of the world's population, or two billion people, carry the TB bacteria".[1]

Broxmeyer suggests that there is an underestimation of tuberculosis deaths using "flu" as the diversion: "Khomenko's 1993 study showed that the explosive contagiousness of just such influenza-like forms of tuberculosis are exactly the stuff that previous epidemics and pandemics could have been made of… But back in the US, the CDC and NIH seem to feel differently, ignoring everything but "the virus". There was much the same "Influenza" talk when in 1990, a new multi-drug-resistant (MDR) tuberculosis outbreak took place in a large Miami municipal hospital. Soon thereafter, similar outbreaks in three New York City hospitals left many sufferers dying within weeks. By 1992, approximately two years later, drug-resistant tuberculosis had spread to deadly mini-epidemics in seventeen US states, and was reported, not by the American, but the international media, as out of control. Viral forms of swine, avian and human TB can be transmitted from one species to another".[2]

He points to the similarities between the onset of the much-cited 1918 "Spanish Influenza" epidemic and that of today. However, as Broxmeyer notes, "a Press Release, issued on August 19, 2008, by the National Institute of Allergy and Infectious Diseases (NIAID), contains a striking finding and conclusion: The 20 to 40 million deaths worldwide from the great 1918 Influenza ("Flu") Pandemic were NOT due to "flu" or a virus, but to pneumonia caused by massive bacterial infection".[3]

Reports of low flying aircraft spraying in regions of Ukraine where outbreaks and lung-related deaths reportedly took place cannot be verified. What is clear however is that there is no scientifically rigorous proof of deaths or diseases that can be labeled H1N1 Influenza A in Ukraine.

Украинцы умирают не от пневмонии, а от вирусного дистресс-синдрома?

Уніан, 13 ноября 2009, 11:00
https://www.unian.net/society/288545-ukraintsyi-umirayut-ne-ot-pnevmonii-a-ot-virusnogo-distress-sindroma.html

Все жертвы вируса на Буковине (22 лица в возрасте от 20 до 40 лет) умерли не от двусторонней пневмонии, как это считалось раньше, а в результате вирусного дистресс-синдрома, то есть тотального поражения легких.

Сначала наступает сердечно-легочная недостаточность, а следовательно развивается кардиогенный шок, который вызывает остановку сердца и смерть. Об этом газете «Доба» сообщил начальник бюро Черновицкой областной судмедэкспертизы, доктор наук, профессор Виктор Бачинский.

«Во время двусторонней пневмонии прослеживается определенная морфологическая картина. Относительно данных смертей, то здесь такой морфологической картины нет. Вирус, который влечет за собой смерть, очень агрессивен, он даже не поражает трахею, а сразу попадает в легкие и вызывает сильный их отек и сплошное кровоизлияние. К такому состоянию приводят смешанные типы парагриппа и гриппа A/H1N1. Это очень токсичный штамм, который до сих пор не поддавался выработанному Минздравом методу лечения», – сообщил Виктор Бачинский.

По его словам, нужно срочно менять стандарты лечения, ведь те, которые применялись до сих пор, результатов не дали – в реанимации не удалось спасти всех людей, пораженных этим вирусом. Не оправдались в этой ситуации и аппараты искусственной вентиляции легких – смертность людей наступала в 100%.

Ввиду этого, группа профессоров Черновицкого медуниверситета обратилась к Министерству здравоохранения и СНБО с требованием пересмотреть стандарты лечения больных на Буковине. Ученые-морфологи отправили в Киев протоколы, результаты исследований и анализы, взятые у тяжело больных и умерших от вируса людей.

Виктор Бачинский, который входит в группу инициаторов обращения, отмечает, что вирус является чрезвычайно токсичным, он способен проникать не только через органы дыхания, но и через глазную оболочку. Потому черновицкие ученые рекомендуют ни в коем случае не отказываться от масок и на период эпидемии даже носить защитные очки. Важным условием для недопущения ухудшения ситуации является также соблюдение карантинного режима.

Анна Ященко

Судмедэксперт рассказал УНИАН, от чего умирают люди

Уніан, 13 ноября 2009, 20:23,
https://www.unian.net/society/288279-professor-immunolog-chesnokom-nado-dyishat.html
https://web.archive.org/web/20091119024614/http://www.unian.net/rus/news/news-346721.html

На основе вскрытий мы пришли к выводу: *это совсем не пневмония, а сердечно-легочная недостаточность и кардиогенный шок... Вирус попадает прямо в легкие, происходит кровоизлияние... Антибиотики использовать нельзя...*

Почему мы получили такой результат по стране заболеваемости и смертности? Потому что лечили не врачи, а аптечная сеть... Никакая это не легочная чума. Это все глупости... Тут антибиотики не помогают... У кого иммунная система сильная – человек выживает. У кого слабая – ничего из этого не выйдет... Маски – это 30% сохранения. Если к этому добавить очки – то уже 40%, потому что вирус проникает через слизистую оболочку.

Начальник бюро Черновицкой областной судмедэкспертизы, доктор наук, профессор Виктор Бачинский выступил с громким заявлением: все жертвы вируса на Буковине (22 человека в возрасте от 20 до 40 лет) умерли не от двусторонней пневмонии, как это считалось раньше, а в результате вирусного дистресс-синдрома, то есть тотального поражения легких. Мы связались с профессором Бачинским, чтобы выяснить, как он пришел к такому заключению и как можно уберечься от такой болезни.

- Господин профессор, раньше вы заявили, что вирус, от которого умерли немало людей, – это смесь типов парагриппа и гриппа A/H1N1. Как вы это установили и как от такой болезни лечиться?

Вопрос, как лечить, – не ко мне. Я морфолог. Я просто определил, что это такое и поставил точный диагноз. А в зависимости от поставленного диагноза нужно назначать правильное лечение.

Есть такое понятие в медицине, как протоколы и стандарты лечения. Если врач “залечил” человека до смерти, родственники могут пожаловаться, что лечили неправильно. Чтобы установить – правильно или нет, – в Министерстве здравоохранения назначены протоколы и стандарты лечения по каждому диагнозу. Если диагноз установлен правильно, то и лечение должно быть правильное...

У нас в области на тот момент умерло 18 человек. Мы проработали все истории болезней, доклинический этап, клинический, реанимационный. При вскрытиях мы посмотрели на органы и ткани, сделали гистологические исследования и пришли к выводу, что это не пневмония, и никакого отношения к пневмонии не имеет. Это основание для того, чтобы врачи, которые лечат эту болезнь по всей Украине, изменили тактику и стандарты лечения и нацелили на это всех.

Новый вирус излечим?

Это зависит от иммунной системы организма. Если у человека иммунная система сильная, то он его преодолеет. Есть люди, которые этот штамм H1N1 переносят на ногах и даже не замечают, что болели.

Применять антибиотики в данном случае нельзя. Почему мы получили такой результат по стране (заболеваемости и смертности), потому что лечили не врачи, а аптечная сеть. Люди

приходили в аптеку, называли свои симптомы и просили лекарства. Скупили все антибиотики, наелись их, снизили иммунную систему и получили ухудшение состояния здоровья. А если бы у нас выдавались медикаменты по рецептам, как за рубежом, то такой бы глупости не было. Им лишь бы, а о том, что они нанесли вред государству, никто не говорит...

Rак выглядели легкие умерших? Они действительно были черные, что породило столько разговоров о легочной чуме?

Никакие они не черные... Это совсем не легочная чума. Это все глупости. Легочная чума имеет совсем другую морфологическую картину. У нас, например, заболело 60 тысяч человек, а умерли 23. При легочной чуме мы имели бы смертность – 59 тысяч... Это вирусное поражение легких.

Получается, что не только на Буковине, но и по всей Украине люди умирали не от пневмонии, а от этого токсичного штамма?

Это не пневмония! Это тотальное поражение легких. Этот штамм очень токсичен, и если иммунная система слаба, происходит кровоизлияние в легкие. У легких есть наименьшая структура – ацинус. Выглядит как гроздь винограда. Человек вдохнул – в эту гроздь винограда зашел кислород. По поверхности этого ацинуса находятся капилляры, где эритроциты напитываются кислородом и отдают кровь, за счет чего все ткани и органы получают питание в организме.

А этот вирус сразу попадает в легкие – в ацинус, и сразу происходит кровоизлияние. Сплошное кровоизлияние... Проходит несколько часов. В крови образуется фибрин, а от него – гиолиновая мембрана, как целлофановый мешок. Она окутывает ацинус, и человек кислород вдыхает, а он не передается тканям. И человек просто задыхается. Наступает сердечно-легочная недостаточность и кардиогенный шок. Человек погибает от кардиогенного шока. А пневмонии нет. Пневмония – это воспаление, которое лечится антибиотиками. А здесь антибиотики ни на одном этапе не помогают. Здесь нужно абсолютно другое лечение.

А как относительно “Тамифлю” – он хоть помогает?

Это не антибиотик, а противовирусный препарат, который нужно применять на вторые-третьи сутки заболевания. Но нельзя употреблять их профилактически, потому что они токсичны.

Как можно противостоять болезни? Целесообразно ли использовать маски, чеснок, витамин С?

Это основное. В первую очередь – маски. Это 30% сохранения. Если к этому прибавить очки – то уже 40%. Потому что вирус проникает через слизистые оболочки.

Нужно повышать иммунную систему человека. Не только сейчас, а вообще. Это и чеснок, и лук, и шиповник, и калина, и малина, и цитрусовые, и мед, фрукты, овощи – что хотите. У кого иммунная система сильная – человек выживает. У кого слабая – ничего из этого не выйдет.

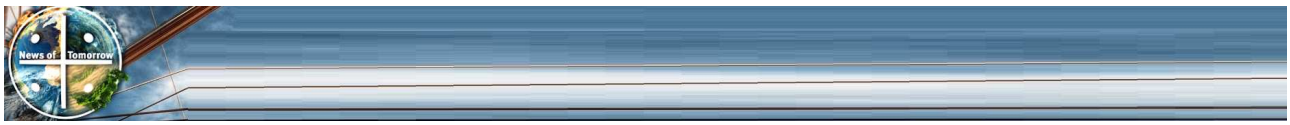
У нас люди бескультурны, требуют открывать рынки. Чем позже мы рынки откроем, тем меньше людей будут контактировать друг с другом и тем больше население мы сохраним.

Вы говорили, что обратились в Минздрав, чтобы они пересмотрели стандарты лечения больных. Что вам ответили?

Мы направили им протоколы и стандарты лечения, данные, что это за диагноз. Они реагируют. Но понятно, что это не может быть одномоментно.

А почему до сих пор никому не удалось установить, что это за болезнь? Что делали ведущие специалисты министерства здравоохранения?

Может, это связано с тем, что есть научные работники, которые работают сугубо теоретически. А есть научные работники, которые видят вскрытия. Я практик, начальник областного бюро судмедэкспертизы и одновременно профессор. То, что мы установили этот диагноз – это не только моя заслуга, и это не мое личное мнение. Это мнение специалистов, морфологов и клиницистов Буковины. Нас работало пятеро профессоров – я просто возглавлял эту группу.



Anna Yashchenko

Ukraine:
Nouveau virus découvert, mortel pour les systèmes immunitaires affaiblis

New of Tomorrow, 13/17 Novembre 2009

https://web.archive.org/web/20091121062319/http://newsoftomorrow.org/spip.php?article6802Unian:
https://web.archive.org/web/20091119024614/http://www.unian.net/rus/news/news-346721.html

Grâce aux autopsies, nous sommes arrivés à la conclusion que ce n'est pas de pneumonie, que les gens meurent, mais d'insuffisance cardio-respiratoire et de choc cardiogénique... Le virus pénètre directement dans les poumons, il créé une hémorragie ... Les antibiotiques ne doivent surtout-pas être utilisés...

Pourquoi tant de morts dans le pays?

Parce que la maladie n'est pas traitée par les médecins, les gens font de l'automédication et achètent les médicaments directement en pharmacie ... Non, ce n'est pas la peste pulmonaire. C'est un non-sens ... Les antibiotiques n'aident pas du tout. Seules les personnes qui ont un système immunitaire en bon état survivent au virus. Les personnes faibles ne s'en sortent-pas ... Les masques réduisent de 30% les risques de contagion. Si l'on porte des lunettes on augmente la protection de 10%, soit 40% au total, étant donné que le virus pénètre par les muqueuses.

Chef du bureau régional des médecins légistes de Tchernivtsi, le Professeur Victor Bachinsky à fait une déclaration importante: les victimes du virus de Bucovine (22 personnes âgées de 20 à 40 ans), ne sont pas mortes d'une pneumonie bilatérale, comme on le pensait auparavant, en raison d'un *syndrome de détresse virale*, mais par la destruction totale de leurs poumons. Nous avons rencontré le professeur Bachinsky, pour savoir comment il en était arrivé à cette conclusion, et quelle est la façon de se protéger contre cette maladie.

«Monsieur le Professeur, vous avez dit précédemment que le virus, qui a tué beaucoup de gens, est un mélange de deux types de virus: le para-influenza et l'influenza A/H1N1. Comment définissez-vous ce virus et comment guérir cette maladie?»

«La question de savoir quel traitement utiliser, n'est pas de mon ressort. Je suis médecin légiste. Mon travail était de faire un diagnostic précis de cette maladie. En fonction de ce diagnostic, il conviendra maintenant d'utiliser le traitement adapté.

Il y a des protocoles de traitement. Si un médecin soigne un homme qui fini par mourir, la famille peut porter plainte, prétendant qu'il n'aurait-pas reçu le bon traitement. Le Ministère de la Santé a élaboré des protocoles de traitement correspondant aux diagnostics. Si le diagnostique est correct, le traitement sera correct ...

Dans notre région 18 personnes sont mortes. Nous avons analysé toute l'étiologie de la maladie, préclinique, clinique et réanimation. Lorsque nous avons examiné les organes et les tissus à l'autopsie, nous avons conclu que ce n'était pas la pneumonie, il n'y a aucun rapport avec la pneumonie. Il est important de veiller à ce que les médecins qui traitent cette maladie, dans tout le pays, changent de tactique et de protocole de soins.

Peut-on guérir de ce virus ?

Cela dépend de votre système immunitaire. Si votre système immunitaire est fort, alors il saura le combattre. Il y a des gens qui sont atteins de cette variante du virus H1N1 et qui ne s'en aperçoivent-pas.

Il ne faut surtout-pas utiliser les Antibiotiques pour cette maladie. Pourquoi avons-nous un taux de mortalité, de morbidité, dans le pays, parce-que les gens n'ont-pas été voir le médecins, ils se sont traités eux-même, directement à la pharmacies. Prendre des antibiotiques diminue les défenses du système immunitaire et la santé se détériore. Si en Ukraine on ne donnait que des médicaments sur prescription médicale, comme à l'étranger, cela ne serait-pas arrivé. C'est l'automédication qui a causé ce drame...

De quoi avaient l'air les poumons? Etaient-ils vraiment noirs, comme le disait cette polémique de la peste pulmonaire?

Non, ils ne sont pas noirs ... Ce n'est pas la peste pulmonaire. C'est un non-sens. La peste pulmonaire a une morphologie très différente. Nous avons 60 000 personnes qui sont tombées malades, 23 sont morts. Si cela avait été la peste pulmonaire, nous en aurions eu 59 000 ... Il s'agit d'une pneumopathie virale.

Il s'avèrerait, que non seulement à Bucovine, mais aussi ailleurs en Ukraine, que les gens ne meurent pas de pneumonie, mais de cette souche toxique?

Ce n'est pas une pneumonie ! C'est une destruction totale des poumons. Cette souche est très toxique, et si le système immunitaire est affaibli, il y a des saignements dans les poumons. Les sacs alvéolaires, dans lesquels se font les échanges gazeux entre l'air et le sang, sont des capillaires, où les globules rouges se saturent d'oxygène, pour ensuite, grâce au sang, nourrir tous les tissus et les organes du corps.

Et une fois que le virus pénètre dans les poumons, dans les vascularisations des sacs alvéolaires, immédiatement survient une hémorragie, une hémorragie continue ... Cela prend plusieurs heures. La personne continue de respirer de l'oxygène, mais celui-ci n'est pas transféré vers les tissus. Les gens suffoquent. L'insuffisance cardio-pulmonaire conduit à un choc cardiogénique. L'homme meurt d'un choc cardiogénique. Et il n'y a aucune pneumonie. La pneumonie est une inflammation qui est traitée avec des antibiotiques. Et là, les antibiotiques, à aucun stade, ne peuvent aider. Il est nécessaire qu'il y ait un traitement absolument différent.

*Que pensez-vous du «**Tamiflu**», est-il utile?*

Ce n'est pas un antibiotique, mais un antiviral, qui ne devrait être appliqué qu'après le deuxième ou le troisième jour de la maladie. Mais il ne faut-pas les utiliser à titre préventif, car ils sont toxiques.

Comment se défendre de cette maladie? Est-il conseillé d'utiliser un masque, de l'ail, de la vitamine C?

En premier lieu porter un masque. Il diminue de 30% les risques de contagion. Si l'on y ajoute le port de lunettes, on arrive à 40%. Etant donné que le virus pénètre par les muqueuses.

Il est nécessaire de favoriser le système immunitaire humain. Pas seulement en ce moment, mais en général. Ceci avec de d'ail et des oignons, de la rose sauvage, de la viorne, des framboises et des agrumes, du miel, des fruits, des légumes, tout ce que vous voulez. Qui a un système immunitaire fort, survit. Qui est faible, ne s'en sortira pas.

Les gens ne cultivent plus leurs jardins, ils ont besoin des marchés. Plus tard nous réouvriront les marchés, moins les gens seront en contact les uns avec les autres, et plus ils seront en sécurité.

Vous avez dit que vous avez communiqué avec le Ministère de la Santé et qu'ils ont révisé les protocoles de traitement des patients. Qu'en pensez-vous?

Nous leurs avons communiqué des protocoles de traitement, toutes les données, tout sur les diagnostics. Ils réagissent, mais il est clair que cela ne sera-pas instantané.

Pourquoi, jusqu'à présent, personne n'a jamais vu cette maladie ? Qu'ont fait les plus grands spécialistes du Ministère de la Santé ?

Peut-être cela est-il dû au fait que ce ne sont que des scientifiques théoriques. Il y en a qui ont vu les autopsies. Et il y a ceux qui pratiquent, comme moi, en tant que chef de la police scientifique du Bureau Régional et Professeur en même temps. Le fait que nous avons établi ce diagnostic, n'est pas seulement de mon fait, ce n'est pas mon opinion strictement personnelle. C'est l'avis des spécialistes et des cliniciens pathologistes de Bucovine. Nous avons travaillé à cinq professeurs, je suis juste le responsable de ce groupe.

THE FLU CASE

This is a report in French on the results of the autopsies

The Flu Case, 17 November 2009 15:09

https://web.archive.org/web/20100102023129/http://theflucase.com/index.php?option=com_content&view=article&id=1850%3Acould-who-announce-the-qreturnq-of-the-spanish-flu-any-day&catid=1%3Alatest-news&Itemid=64&lang=en

L'article de zavrtra.com, «Souche 100% mortelle en Bucovine (Ukraine)», que nous avons placé jeudi dernier sur ce forum (1), n'en fini pas de faire des vagues dans les médias russophones. Le professeur Bachinsky à donné hier un entretien au journal unian.com, que nous venons de traduire et de placer sur mecanopolis.org:

Sur la base des autopsies réalisées, nous sommes arrivés à la conclusion que les décès n'ont pas été causés par une pneumonie, mais par une insuffisance cardio-respiratoire et un choc cardiogénique. Le virus pénètre directement dans les poumons, et crée des lésions irréversibles qui entrainent une hémorragie, et la mort. En aucun cas des antibiotiques ne devraient être utilisés.

Professeur Victor Bachinsky, médecin légiste

Le responsable du département régional des médecins légistes de Tchernivtsi, le professeur Victor Bachinsky, vient de faire une déclaration explosive: toutes les victimes du virus en Bucovine (22 personnes âgées de 20 à 40 ans), province ukrainienne, ne sont pas mortes d'une pneumonie provoquée par une détresse virale, mais par une destruction totale des poumons. Nous avons rencontré le professeur Bachinsky, afin de savoir comment il en est arrivé à cette conclusion, et pour connaitre la façon de se protéger contre cette maladie.

Unian: Monsieur le professeur, vous avez précédemment indiqué que ce virus, par lequel beaucoup de gens sont morts, est un mélange du parainfluenza et de la grippe A/H1N1. Comment expliquez-vous cette progression de l'épidémie et comment est-il possible de soigner cette maladie?

Professeur Victor Bachinsky: La question de savoir comment traiter ce virus ne me concerne pas directement. Je suis pathologiste. Mon travail consiste à découvrir comment évolue un virus et de réaliser un diagnostic exact sur la maladie qu'il provoque. Dix-huit personne sont mortes dans la région de Tchernivtsi. Nous avons fait l'historique complet de l'évolution du virus et recherché tous les indices liés à cette maladie. Lorsque nous avons effectué les autopsies, les organes et tissus que nous avons prélevés ont démontré qu'il ne s'agissait pas de pneumonies. Ces résultats sont une base scientifique qui peut maintenant permettre aux médecins qui traitent cette maladie dans tout le pays de changer leur stratégie de soins.

Unian: Comment cette nouvelle maladie peut-elle être soignée?

VB: Pour l'instant, cela dépend du système immunitaire du malade, car il n'y a pas de traitement. Si son système immunitaire est résistant il devrait pouvoir guérir. Ce qui est urgent de pendre en comte, c'est que les antibiotiques ne devraient pas être utilisés pour traiter ces patients. Les antibiotiques sont même la raison pour laquelle nous avons un tel taux de mortalité élevé en Ukraine. Ici, les gens peuvent aller décrire leurs symptômes dans une pharmacie et se faire remettre des antibiotiques sans consulter un médecin. Les antibiotiques altèrent les défenses naturelles de l'organisme et augmentent le risque d'une plus grande infection. C'est la possibilité d'obtenir des médicaments sans ordonnances qui en ce moment permet au virus de s'étendre en Ukraine.

Est-i vrai que les poumons des victimes étaient noirs, ce qui a permis de rependre la rumeur d'une «peste noire»?

Non, les poumons n'étaient pas noirs. Il ne s'agit pas d'une peste pulmonaire. Il s'agit d'une attaque virale qui détruit les poumons. Vous pensez donc que, non seulement a Bucovine, mais aussi dans tout le pays, les victimes ne sont pas morte de pneumonies, mais à cause de cette nouvelle souche?

En effet, ce n'est pas une pneumonie, mais une destruction totale des poumons qui est à l'origine des décès. Cette souche est très toxique, et, si le système immunitaire du malade est faible, elle crée une hémorragie dans les poumons. Ainsi, une fois que le virus pénètre dans les poumons, l'hémorragie commence immédiatement. L'oxygène ne circule plus normalement dans les alvéoles pulmonaires, ce qui crée une insuffisance cardio-pulmonaire et entraine une choc cardiogénique, puis la mort.

Le Tamiflu peut-il aider dans le traitement de ce virus?

Le Tamiflu n'est pas un antibiotique, c'est un antiviral. Il devrait être appliqué à partir du deuxième ou troisième jour de la maladie, dès que des signes inquiétants apparaissent. Mais il n'est toutefois pas possible de l'utiliser à titre préventif, car ses effets secondaires sont trop toxiques.

Comment peut-on se préparer pour résister à la maladie?

Il est nécessaire d'améliorer le système immunitaire humain. Pas seulement aujourd'hui, à cause de ce virus, mais en général. Celui qui aura un système immunitaire robuste s'en sortira. Celui dont le système immunitaire est affaibli risque de succomber à la maladie.

Vous avez contacté le ministère de la Santé et leur avez conseillé de revoir les types de traitement pour lutter contre cette épidémie qui survient actuellement. Vous ont-ils suivi ?

Nous leur avons envoyé toutes nos informations, les protocoles et normes de traitement ainsi que notre diagnostic final. Mais il est évident que leurs décisions ne peuvent être instantanées.

Et pourquoi, jusqu'à présent, personne d'autre n'a diagnostiqué cette maladie?
Que font les spécialistes du ministère de la Santé ?

C'est peut-être du au fait que la plupart des chercheurs travaillent sur une base purement théorique. Des scientifiques ont déjà pu apprécier les résultats de nos autopsies. En ce qui me concerne, j'exerce en tant que chef du bureau de la police scientifique et en tant que professeur. Il ne s'agit donc pas de mon opinion personnelle, mais du résultat d'un ensemble de chercheurs, spécialistes et médecins de Bucovine. Il y a cinq professeurs dans l'équipe que je dirige.

Из паники – в Пофигизм

Domik Новости, 13 ноября 2009
https://domik.ua/novosti/iz-paniki---v-pofigizm-n69513.html

Киевские власти говорят, что в городе – 31 больной свиным гриппом и 6 смертей. Власть, к ужасу иммунологов, требует немедленной вакцинации.

Когда свиной грипп в Тернополе только-только перестал быть предположением, дрожала и шепталась вся Украина. Вирус A/H1 N1 казался страшней любой другой опасности. «Самое яркое впечатление: две тетки в масках, перебегающие улицу на красный свет», - писали в одном из блогов. А что сейчас? За сутки, по официальным данным, в стране умирает по 15-19 человек, зараза точно в Киеве – а народ расслабился. Масок, во всяком случае, в транспорте стало на порядок меньше. Сработал механизм, о котором «Газету... » предупреждал социальный психолог Олег Покальчук: тема перестала волновать новизной, превратилась в гнетущую «почти обыденности» – и сознание старается ее вытеснить. Вдобавок мы убедились, что можно перенести свиной грипп, благополучно выздороветь, и только потом узнать, чем болел.

– Умирают в основном те, у кого есть осложнения по другим хроническим заболеваниям, – рассказала вчера на брифинге заммэра Ирэна Кильчицкая. – Это диабет, болезни эндокринной системы, ожирение. Или те, кто поздно обратился за помощью. Среди умерших – одна беременная женщина с диабетом.

По словам Кильчицкой,до понедельника в Украине работало всего 2 лаборатории, которые могли диагностировать свиной грипп: е институте Громашевского и в институе гриппа. Каждая из лабораторий могла делать не больше 30 анализов в сутки. Это очень мало, поэтому у многих диагностировали свиной грипп уже после того, как они переболели и выздоровели.

С понедельника государственная санитарная служба открыла лабораторию, где могут определять штамм вируса за 8 часов. Экспресс-тесты далеко не всегда говорят правду.

Были случаи, когда они не подтверждали наличие вируса свиного гриппа, а длительный тест потом подтверждал. И наоборот.

Обнаружили вирус у девочки, дочки 35-летней женщины, умершей от свиного гриппа в ночь со 2 на 3 ноября (напомним, это был первый смертельный случай в Киеве). Но девочка идет на поправку. Из 3-ей детской больницы выписался 3-месячный ребенок.

Лишь после его выздоровления определили, что малыш переболел именно свиным гриппом. В больнице N°9 сейчас лечится гражданин России. 3 ноября у него, когда он был еще на родине, диагностировали свиной грипп. был в больнице, пошел на поправку, выписался и приехал в Киев 7 ноября в командировку. Здесь ему снова стало плохо. И результат анализа снова подтвердил, что у него свиной грипп. Еще два подростка 17 и 18 лет лежат в детской больнице, им стало лучше.

Власти убеждают, что ужесточать карантинные меры, несмотря на такую статистику, не стоит. Уровень заболеваемости резко не увеличивается, остается примерно на одном и том же уровне. Прогнозируют, что так будет и в дальнейшем. А вот второй всплеск заболеваемости прогнозируют, когда закончится карантин и студенты начнут возвращаться в Киев.

Недавний страх перед свиным гриппом притупившийся у всех

...

Премьер Юлия Тимошенко заявила вчера, что наметившийся спад с 8 ноября прекратился и 10 ноября количество заболевших за сутки, увеличившись в 2 раза, достигло 90.592 человек. Тимошенко заговорила об «угрожающей динамике, требующей снова более активных действий».

А это, с ее слое, - обеспечение врачей лекарствами и оборудованием (хотя недавно мы слышали, что «страна полностью подготовилась»!) и немедленная вакцинация как от сезонного гриппа, так и от калифорнийского. Прививать нас собираются бесплатно и добровольно. Но ведь медики говорили, что во время эпидемии это бесполезно и даже вредно!

Спад по «гриппу вообще» в Киеве продолжается Мы не сообщали киевским медикам, что обращаемся к ним, чтобы поставить под сомнение слова премьера. Но никто о всплеске заболеваемости рассказать не смог.

– К нам с первых чисел ноября стало обращаться на 30% меньше больных с ОРВИ и гриппом, -говорит начмед поликлиники Подольского района N°2 Игорь Омельченко. – А с 7-8 числа мы отмечаем уменьшение на 5-7%.

– На выходных таких пациентов было много, но с понедельника – все меньше, рассказывает Леся Дорошенко, начмед поликлиники Дарницкого района N°3, – больше больных с ОРВИ и гриппом? Да нет же, их в последние дни становится меньше, – удивляется Валентина Антонова, зам главного врача поликлиники Шевченковского района N°3.

Допустим, увеличение - не за счет столицы, а за счет востока страны. Об этом вчера говорил и главный санврач страны Александр Биловол, тоже настаивающий на вакцинации. Но разве в Минздраве не подозревали, что грипп поползет туда? Почему же тогда «снова активные действия» понадобились внезапно, а не были выполнены заранее, без шума и пыли? И кто заслужил за это хорошего ремня?

А Польша неисследованной вакциной прививаться не будет...

Вакцинироваться от сезонного гриппа надо, от свиного - тоже. Но вот Ева Копач, глава польского Минздрава, отказалась проводить вакцинацию от A/H1 N1, пока фирмы, делающие вакцину, не предоставят результаты исследований ее безопасности. Критику в свой адрес Копач объяснила тем, что производители хотят быстрей заработать на вакцине, но не хотят брать на себя ответственность, если она вдруг нанесет вред. Украину это отчего-то не пугает.

Так или иначе, «Газета...» не раз печатала заявления иммунологов: делать прививку надо не во время эпидемии, а хотя бы парой недель раньше, чтобы иммунитет успел сформироваться. Есть и более жесткие мнения.

– Прививать во время эпидемии – это преступление! – считает ученый секретарь института микробиологии и иммунологии имени Мечникова Артур Мартынов. - Вы не отличите здорового человека от того, кто только что переболел в очень легкой форме, введете ему вакцину - и можете вызвать тяжелейший рецидив!

INFOWARS IRELAND

Ukraine: Virus is Mixture of H1N1 and Parainfluenza, Causes Cardiopulmonary Failure; Indicates BioWeapon

Info Wars Ireland, 14 November 2009

https://web.archive.org/web/20091115142104/http://info-wars.org/2009/11/14/parainfluenza-and-ah1n1-mixture-in-ukraine-total-destruction-of-the-lungs/

*Professor **Victor Bachinsky**, PhD., is a coroner in the Chernivtsi region of Ukraine. He provides evidence which indicates that parainfluenza mixed with the H1N1 virus, not pneumonic plague, has caused so much illness in Ukraine. Yet more strains of influenza which have combined, a strong indication that we are dealing with a laboratory developed bio-weapon.*

Based on autopsies, we have come to the conclusion: it's not pneumonia, but *cardiopulmonary insufficiency* and *cardiogenic shock* … The virus enters directly into the lungs, there is bleeding … Antibiotics should not be used …

Why do we have such a high mortality rate in the country?

Because people are going to pharmacies to get medicine instead of going to their doctors to be treated … No it is not pneumonic plague. It's all nonsense … antibiotics do not help … Those with strong immune systems will survive. People with weak immune systems will succumb to the illness … Face Masks provide 30% extra protection. Wearing glasses gives an additional 10% protection, that is 40%, because the virus penetrates the mucose membranes.

The Head of the Chernivtsi regional forensic bureau, Professor Victor Bachinsky PhD, makes a strong statement: all the victims of the virus in Bukovina (22 persons aged 20 to 40 years) died not from bilateral (double) pneumonia, as previously thought, but as a result of ***viral distress syndrome***, i.e. the total destruction of the lungs. We caught up with Professor Bachinsky, to find out how he came to this conclusion, and how people can protect themselves from this disease.

Professor, you said earlier that the virus, from which many people have died – is a mixture of types of parainfluenza and influenza A/H1N1. How do you cure this disease?

The question of how to treat this virus is not up to me. I am a pathologist. I just found out what it is and made an exact diagnosis. It is important to provide the correct treatment based on diagnosis.

There are strict protocols and standards of treatment in medicine. If a doctor treats a patient who dies, their relatives can make a complaint that they were not treated properly (misdiagnosed).The Ministry of Health has set the protocols and standards of treatment for each diagnosis. If diagnosed correctly, the treatment should be correct …

In the Chernivtsi region 18 people have died. We studied all the history and evidence from this disease, preclinical, clinical, resuscitation. When we perform an autopsy organs and tissues have histological studies (cell analysis) and we concluded that it was not pneumonia, and has no relation to pneumonia whatsoever.

These results are the foundation to ensure that doctors who treat this disease all over Ukraine, change their tactics and standards of care.

Can this new virus be cured?

It depends on the immune system. If a person's immune system is strong, they will overcome it. There are people who carry this strain of H1N1 and remain on their feet and don't even realise they are sick.

Antibiotics definitely should not be taken. Antibiotics are the reason we have such a high mortality and infection rate in this country, because people go to the pharmacy, describe their symptoms to the pharmacist and ask for drugs. They buy antibiotics, take them, this lowers their immune system and as a result they become sick. If prescriptions were required to buy these medications, like in other countries, this would not have happened. It is the ability to buy antibiotics over the counter without a prescription which has done so much harm to the State.

During autopsies, what did the lungs look like? Were they really black, which gave rise to so much talk of pulmonary plague?

No, they are not black … This is not pneumonic plague. It's all nonsense. Pneumonic plague has a very different morphology. We have, for example, 60 thousand people who became sick and 23 have died. With pulmonary plague, we would now have a mortality rate of 59 thousand …

This is a viral attack that destroys the lungs. It turns out that not only in Bukovina, but also throughout the Ukraine people did not die from pneumonia, but from this toxic strain?

Yes, It's not pneumonia! This destruction of the lungs. This strain is very toxic, and if the immune system is weak, there is bleeding in the lungs. In the lungs there is a tiny structure – acinus, which looks like a bunch of grapes. When you breathe, oxygen enters this tiny "bunch of grapes" (pulmonary alveoli). On the surface of the acinus are the capillaries, where red blood cells saturate with oxygen and give blood, which supplies all tissues and organs in the body.

And once the virus enters the lungs – hemorrhaging begins immediately in the acinus. A continuous hemorrhage … It takes several hours. In the blood fibrin is formed, and from it – giolinovaya membrane, resembling a plastic bag. It envelops the acinus, and the person breathes in oxygen, but it is not transferred to the tissues. And people just gasp. There is a cardio-pulmonary insufficiency and cardiogenic shock. People die of cardiogenic shock. And there is no pneumonia. Pneumonia – an inflammation, which is treated with antibiotics. Antibiotics cannot help at any stage. There should be absolutely different treatment.

And how about "*Tamiflu*" – does it help?

This is not an antibiotic, it is an antiviral drug, which should be applied on the second or third day of the disease. But you can not use Tamiflu as a preventitive, because it is toxic.

What are the best measures to resist the disease? Is it advisable to use a mask, garlic, vitamin C?

The primary method of prevention is a face mask. This give 30% extra protection. If you wear glasses – it is 40%, because the virus enters through the mucous membranes. It is necessary to improve the human immune system. Not only now, but in general. Garlic, onions, wild rose, viburnum (guelder rose), raspberries, citrus fruit, honey, and other fruits and vegetables – whatever you want. Those with a strong immune system will survive. Those with weaker immune systems will succumb to the disease.

We have a lot of people in Ukraine who like shopping at the open markets. If we can avoid open markets, the less people will be in contact with each other and more lives will be saved.

You have contacted the Health Ministry and advised them to review the standards for treatment of patients. What did they say?

We sent them all our data, the necessary protocols and standards of treatment, our diagnosis. But it is clear that decisions cannot be instantaneous.

And why until now has nobody else known about this disease? What were the leading specialists in the Ministry of Health doing all this time?

Perhaps this is due to the fact that there are scientists who are working on a purely theoretical basis. And there are scientists who have seen the autopsy results. I practice as head of the regional forensic bureau and as a professor. The fact that we have established this diagnosis – it is not just to my credit, and this is not my personal opinion. This is the opinion of specialists, morphologists and doctors in Bukovina. There are five professors in our group – I just head the group.

Mail Online

British scientists testing Ukrainian 'super flu' that has killed 189 people

Daily Mail, 15 November 2009, 22:41 BST
https://www.dailymail.co.uk/news/article-1227984/British-scientists-testing-Ukrainian-super-flu-killed-189-people.html#ixzz0X0HPxCph

British scientists are examining the strain of swine flu behind a deadly Ukrainian outbreak to see if the virus has mutated.

A total of 189 people have died and more than one million have been infected in the country.

Some doctors have likened the symptoms to those seen in many of the victims of the Spanish flu which caused millions of deaths world-wide after the World War One.

An unnamed doctor in western Ukraine told of the alarming effects of the virus.

He said: 'We have carried out post mortems on two victims and found their lungs are as black as charcoal.

'They look like they have been burned. It's terrifying.'

Neighbouring Poland has called on the EU to take action, fearing the mystery virus may spread westwards.

Prime Minister Donald Tusk has written to European Commission President Jose Manuel Barroso and the Swedish Prime Minister, Fredrik Reinfeldt, who holds the EU presidency.

The letter said: 'The character of this threat demands that rapid action be undertaken at the European Union level.'

Russia, Slovakia, Poland, Hungary and Romania have already launched health checks on Ukrainians entering their territory.

Slovakia has closed two of five border crossings.

Ukrainian President Viktor Yushchenko has called in the World Health Organisation.

A team of specialists are carrying out tests in Kiev and Lviv in an effort to identify the virus.

President Yushchenko said: 'People are dying. The epidemic is killing doctors. This is absolutely inconceivable in the 21st Century.'

In a TV interview, the President added: 'Unlike similar epidemics in other countries, three causes of serious viral infections came together simultaneously in Ukraine: two seasonal flus and the Californian flu.

'Virologists conclude that this combination of infections may produce an even more aggressive new virus as a result of mutation.'

Four men and one woman have died from the flu in Lviv, said emergency hospital chief doctor Myron Borysevych.

Two of the dead patients were in the 22-35 age group, with two others over 60.

He diagnosed the disease as viral pneumonia.

'We have sent the analyses to Kiev. We don't believe it's H1N1 swine flu. Neither do we know what kind of pneumonia it is.'

Universities, schools and nurseries have been closed, public meetings have been banned and theatres shut.

The virus from the Ukraine is being tested at the Medical Research council labs in Mill Hill North London .

A spokesman said: 'We do not have a time scale for the results of the tests, although some preliminary results have been obtained. I cannot tell you what they are.

'We did not have enough of the virus samples so we will have to grow some more before we can come to a conclusive decision about its nature.'

Британские ученые изучают украинский "супергрипп", убивший 189 человек

InoPress, 16 ноября 2009
https://www.inopressa.ru/article/16Nov2009/dailymail/flu2.html

Британские ученые изучают штамм свиного гриппа, ответственный за вспышку респираторных заболеваний на Украине, чтобы определить, произошла ли мутация вируса, пишет Daily Mail.

Всего в стране от аденовирусной инфекции за последнее время умерли 189 человек, и свыше миллиона человек заразились.

Некоторые медики соотносят симптомы нынешнего заболевания с теми, что проявлялись у жертв испанки, которая привела к гибели миллионов человек после Первой мировой войны.

Один из врачей на Западной Украине так описал страшные проявления вируса: "Мы провели вскрытие двух жертв, и обнаружили, что их легкие черны как уголь. Они выглядят так, будто они сгорели. Это ужасно".

Главный врач Львовской больницы скорой помощи Мирон Борисевич определил диагноз как вирусная пневмония. "Мы не верим, что это свиной грипп H1N1. Но мы не знаем, что это за пневмония", - добавил он.

Million hit by 'plague worse than swine flu'

Daily Express, 15 November 2009, 00:00,
http://www.express.co.uk/posts/view/140492/Million-hit-by-plague-worse-than-swine-flu
https://web.archive.org/web/20091118230547/http://www.express.co.uk/posts/view/140492/Million-hit-by-plague-worse-than-swine-flu

A Deadly plague could sweep across Europe, doctors fear, after an outbreak of a virus in Ukraine plunged the country and its neighbours into a state of panic.

A cocktail of three flu viruses are reported to have mutated into a single pneumonic plague, which it is believed may be far more dangerous than swine flu. The death toll has reached 189 and more than 1 million people have been infected, most of them in the nine regions of Western Ukraine.

President Yushchenko said: “People are dying. The epidemic is killing doctors. This is absolutely inconceivable in the 21st Century.”

In a TV interview, the President added: “Unlike similar epidemics in other countries, three causes of serious viral infections came together simultaneously in Ukraine – two seasonal flus and the Californian flu

“Virologists conclude that this combination of infections may produce an even more aggressive new virus as a result of mutation.”

Prime Minister Yulia Tymoshenko has been touring hospitals where victims are being treated and presidential elections in January could be cancelled.

Four men and one woman have died from the flu in Lviv, said emergency hospital chief doctor Myron Borysevych. Two of the dead patients were in the 22-35 age group, with two others over 60. He diagnosed the disease as viral pneumonia.

THE FLU CASE

Nighttime aerosol spraying by planes reported in Poland

The Flu Case, 16 November 2009

https://web.archive.org/web/20100102040228/http://theflucase.com/index.php?option=com_content&view=article&id=1815%3Anighttime-aerosol-spraying-by-planes-reported-in-poland&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Reports are coming in from Poland that airplanes carrying out aerosol spraying have been flying in the middle of the night. Planes were reported in the Gdansk area and in the south east. A pilot reported hearing an aircraft noise that he could not identify in the night time.

The reports of airplanes carrying out spraying in the night are similar to the ones from western Ukraine when low flying light airplanes carrying out aerosol spraying over Ukrainian cities were seen during the days of October 29, 2009 and October 31, 2009 just before huge numbers of people began to get sick and the first deaths from the pneumonia plague were diagnosed.

The Ukraine government issued a statement denying that it was doing any aerial spraying to combat the growing disease or authorizing any spraying over Ukrainian cities.

The Ukraine government has since implemented a state of emergency, postponed elections, banned public meetings, closed some of its borders, ordered the arrest of critics of vaccinations and is also prepared for a mass forced vaccination programme with the toxic and untested swine flu jab.

WHO has acquired extraordinary powers over the Ukraine as a result of this emergency declaration under the pretext of fighting a pandemic.

WHO and Baxter have been linked to bioterrorism activities and the release of the pneumonic plague by a number of analysts.

There are no reports of pneumomic plague in Poland so far.

"Сожженные легкие" жертв свиного гриппа на Украине напомнили врачам грозную "испанку"

News.ru, 16 ноября 2009, 14:59
https://www.newsru.com/world/16nov2009/grimut.html

Британские исследователи, изучающие штамм **свиного гриппа**, ответственный за вспышку респираторных заболеваний на Украине, подозревают, что в нем произошла мутация. Некоторые симптомы, по словам врачей, напоминают печально известную "испанку", вспыхнувшую в Европе после окончания Первой мировой войны и унесшую около 50 миллионов жизней. В частности, легкие жертв вируса становятся черными, как уголь, рассказал один из врачей, описывая страшные проявления вируса.

"Мы провели вскрытие двух жертв и обнаружили, что их легкие черны как уголь. Они выглядят так, будто они сгорели. Это ужасно", - цитирует врача британское издание The Daily Mail, на которое ссылается InoPressa.ru.

Главный врач Львовской больницы скорой помощи Мирон Борисевич определил диагноз как вирусная пневмония. "Мы не верим, что это свиной грипп H1N1. Но мы не знаем, что это за пневмония", - добавил он.

Отметим, что ранее сильное воздействие нового штамма гриппа на легкие было обнаружено в ходе опытов на животных. Исследователи из Японии, проверяя действие новых лекарств от свиного гриппа, подтвердили, что болезнь передается воздушно-капельным путем и не всегда через непосредственный контакт. Кроме того, они пришли к выводу, что A/H1N1 сильнее обычного гриппа поражает легкие, писала Газета GZT.ru.

Именно так действовал в свое время вирус "испанки". Как установили ученые, он вызывал неконтролируемую реакцию иммунной системы, заставляя иммунные клетки атаковать органы респираторной системы. Такая реакция, как показали опыты на животных, в считанные дни уничтожала их легкие и приводила к смерти. В результате пандемии испанского гриппа 1918 года умерло около 50 миллионов человек.

Напомним, что, по последним данным, на Украине от свиного гриппа погибло уже около 200 человек, заражено более одного миллиона. Президент Украины Виктор Ющенко обратился за помощью во Всемирную организацию здравоохранения. Граничащие с Украиной страны опасаются распространения вируса на свои территории.

Свиной грипп (Справка)

Грипп A/H1N1 (свиной грипп) - высокозаразное острое респираторное заболевание. Он относится к типу А (наиболее распространенный тип гриппа, вызывающий масштабные эпидемии). По данным ВОЗ, грипп, вызванный новым вирусом A/H1N1, ранее никогда не циркулировал среди людей. Известных случаев инфицирования людей при контактах со свиньями или другими животными не было.

A/H1N1 не связан с вирусами предыдущих или текущей эпидемий сезонного гриппа среди людей. Он распространяется от человека человеку и передается так же легко, как и обычный сезонный грипп (воздушно-капельным путем). Этот вирус вызывает у человека симптомы, типичные для гриппа и ОРВИ, - головная боль, повышение температуры, кашель, рвота, диарея, насморк. Вирус не всегда вызывает заболевание и выявляется только по наличию антител в крови человека.

В 2009 году произошла вспышка нового штамма вируса A/H1N1. Ее начало датируют 18 марта, когда были зафиксированы первые случаи заболевания в Мехико. Далее грипп стал распространяться по всей Мексике и США. Первый случай заболевания в Европе был зафиксирован в Испании в апреле, в настоящее время он обнаружен почти во всех странах Европы. В июне Всемирная организация здравоохранения (ВОЗ) повысила до максимального - шестого - уровень угрозы инфицирования вирусом нового гриппа A/H1N1. Одновременно с этим специалисты организации заявили о начале впервые за последние 41 год пандемии нового вируса гриппа.

Согласно данным Всемирной организации здравоохранения, на планете зафиксировано свыше 414 тыс. лабораторно подтвержденных случаев заражения вирусом A/H1N1, более 5 тыс. человек скончались. Для сравнения: ежегодно в мире обычным сезонным гриппом заболевают около 1 млрд человек, умирают - 3 млн.

Первые упоминания о гриппе были отмечены много веков назад - еще в 412 году до н.э. описание гриппоподобного заболевания было сделано Гиппократом. Первая задокументированная пандемия гриппа, унесшая много жизней, случилась в 1580 году. Печально известная "испанка" произошла в 1918-1920 годах. Это самая сильная из известных пандемий.

Возбудитель заболевания, вирус гриппа, был открыт Ричардом Шоупом в 1931 году. Вирус гриппа А впервые был идентифицирован английскими вирусологами в 1933 году, вирус группы В - в 1936 году, группы С - в 1947 году.

NEWS.am
GOOD MORNING, WORLD!

Вирус A/H1N1 и известная «испанка», унесшая жизни 50 млн. человек имеют схожие характеристики

Новости Армении, 16 ноября 2009, 15:18
https://news.am/rus/news/8739.html

Вирус A/H1N1, более известный как «свиной грипп», возможно, начал мутировать. К такому выводу пришли британские исследователи, изучающие штамм свиного гриппа, ответственный за вспышку респираторных заболеваний в Украине, и унесший жизни более 6000 человек во всем мире.

При этом, как сообщает Daily Mail, некоторые медики соотносят симптомы нынешнего заболевания с теми, что проявлялись у жертв так называемой «испанки», которая вспыхнула после Первой мировой войны.

Отметим, что во время эпидемии «испанки» – особого вида гриппа – в мире, согласно подсчетам, с весны 1918 до лета 1920 года умерли 50 млн. человек. Существовала информация о том, что у людей, которые пережили эту эпидемию, в крови сохранились особые и исключительно активные антитела, способные противостоять и ряду модификаций появившегося в последние годы вируса птичьего гриппа.

Издание также приводит слова одного из врачей на Западной Украине, который рассказывает о результатах вскрытия жертв опасного вируса: «*Мы провели вскрытие двух жертв, и обнаружили, что их легкие черны как уголь. Они выглядят так, будто они сгорели. Это ужасно*».

Схожесть характеристик вирусов таким образом становится очевидным, ведь вирус «испанки», как установили ученые, вызывал неконтролируемую реакцию иммунной системы, заставляя иммунные клетки атаковать органы респираторной системы, что за считанные дни уничтожало легкие больных и приводило к смерти.

Всего в Украине от аденовирусной инфекции за последнее время умерли 189 человек, и свыше миллиона человек заразились.

Plague or Plan? Ukraine's mystery disease 'burns out lungs'

Dailymotion / Russia Today, 17 Nov 2009
https://www.dailymotion.com/video/xw6wv5

Грипп в Украине мутировал и сжигает легкие, говорят британские ученые

Британские ученые, изучающие штамм свиного гриппа, из-за которого началась эпидемия в Украине, подозревают, что произошла опасная мутация вируса, пишет Daily Mail.

Некоторые симптомы, по словам врачей напоминают вирус "испанки", вспыхнувшей в Европе после Первой мировой войны. Тогда от вируса умерло по меньшей мере 20 миллионов человек, передаёт *InoPressa*.

В пользу версии о мутации вируса, по словам врачей, говорит то, что лёгкие жертв болезни становятся чёрными, как уголь. "Мы провели вскрытие двух жертв и обнаружили, что их лёгкие чёрные, как уголь. Они выглядят так, будто они сгорели. Это ужасно", - сказал один из исследователей.

В свою очередь, главный врач Львовской больницы скорой помощи Мирон Борисевич определил диагноз, как вирусная пневмония. "Мы не верим, что это свиной грипп A/H1N1. Но мы не знаем, что это за пневмония", - рассказал он.

Отметим, что раньше сильное влияние нового штамма гриппа на лёгкие было обнаружено в ходе опытов на животных.

Исследователи из Японии, проверяя действие новых лекарств от свиного гриппа, подтвердили, что болезнь передаётся воздушно-капельным путём и не всегда через непосредственный контакт. Кроме того, они пришли к выводу, что A/H1N1 сильнее, чем обычный грипп, поражает лёгкие.

Именно так действовал в свое время вирус "испанки". Как установили учёные, он вызывал неконтролируемую реакцию иммунной системы, принуждая иммунные клетки атаковать органы респираторной системы. Такая реакция, как показали опыты на животных, в считанные дни уничтожала их лёгкие и приводила к смерти.

Напомним, раньше группа черновицких медиков во главе с начальником бюро Черновицкой областной судмедэкспертизы, профессором Виктором Бачинским, пришла к выводу, что 22 человека, умершие на Буковине за время эпидемии гриппа, погибли от вирусного дистресс-синдрому, то есть тотального поражения лёгких.

По словам медиков, эта болезнь, возникшая в результате смешивания штаммов обычного и свиного гриппа, является новой для Украины, потому необходимо срочно менять методы её лечения.

Influenza in Ukraine mutated and burns the lungs, British Scientists say

British scientists studying a strain of swine influenza, because of which the epidemic began in Ukraine, suspect that there was a dangerous virus mutation, writes Daily Mail.

=> https://www.dailymail.co.uk/news/article-1227984/British-scientists-testing-Ukrainian-super-flu-killed-189-people.html#ixzz0X0HPxCph

Some of the symptoms, doctors say resemble virus "Spanish flu" outbreak in Europe after the First World War. Then the virus have died at least 20 million people, reports InoRressa.

n favor of the version of mutation of the virus, according to doctors, said that the lungs of victims of the disease are black as coal. "We conducted an autopsy of the two victims and found that their lungs are black as coal. They look as if they were burned. It's terrible," - said one of the researchers.

In turn, the chief doctor of the Lviv Emergency Hospital Miron Borisevich identified diagnosed as viral pneumonia. "We do not believe that this swine influenza A/H1N1. But we do not know what kind of pneumonia," - he said.

Note that before strong influence of a new strain of influenza in the lungs was found during experiments on animals.

Researchers from Japan, testing of new drugs against swine flu, confirmed that the disease is transmitted by airborne droplets and not always through direct contact.

In addition, they concluded that A/H1N1 is stronger than the usual flu affects the lungs.

This is acted at the time the virus "Spanish flu".

As established scientists, it caused an uncontrolled reaction of the immune system, forcing the immune cells attack the organs of the respiratory system.

Such a reaction, as shown by experiments on animals, in a few days destroyed their lungs and lead to death. Total in the Ukraine of influenza epidemic of complications 299 people died.

Recall earlier Chernivtsi Medical Group, headed by the Chief of the Chernivtsi regional forensic bureau, Professor Victor Bachinsky, concluded that 22 people have died in Bukovina during the influenza epidemic, died of viral distress syndrome, i.e. the total destruction of the lungs.

According to doctors, the disease has arisen as a result of mixing conventional and swine strains of influenza, is new to Ukraine, because an urgent need to change its methods of treatment.

These reports are in Direct disagreement to the WHO report below - saying it is the Swine Flu! I thought the WHO looked out for the best interest of the people of the world and their health. But considering they used 34 samples ONLY to test for the Swine Flu or what the is spreading in the Ukraine - I believe they Chose the samples they wanted to (as I mention below). No wonder the Ukraine shut down their one lab last week, they don't want them to disagree with the WHO's findings!

THE FLU CASE

UK bioweapons lab allegedly finds evidence swine flu has mutated in the Ukraine

The Flu Case, 17 November 2009.
https://web.archive.org/web/20100102011308/http://theflucase.com/index.php?option=com_content&view=article&id=1843%3Auk-bioweapons-lab-allegedly-finds-evidence-swine-flu-has-mutated-in-the-ukraine&catid=1%3Alatest-news&Itemid=64&lang=en

Doctors on the ground in the Ukraine have reported people haved died from the pneumonia plague but scientists from the Uk bioweapons lab, the Institute of Medical Research at Mill Hill, now appear to be claiming that the swine flu virus has mutated to become more virulent and is causing large numbers of deaths.

WHO has confirmed that "no significant changes in the pandemic (H1N1) 2009 virus" has taken place "based on investigations of samples taken from patients in Ukraine" but has not released the sequences. WHO has also not investigated the appearance of the plague, it seems.

Will WHO and their allies in UK labs use the pandemic plague as a cover for introducing a genetically modified, virulent virus into vaccines?

…

Who's Official Release on Ukraine =>
Pandemic (H1N1) 2009, Ukraine - update 2. – Geneva, WHO, 17 November 2009.
https://web.archive.org/web/20091118031055/http://www.who.int/csr/don/2009_11_16/en/index.html

17 November 2009 – Preliminary tests reveal no significant changes in the pandemic (H1N1) 2009 virus based on investigations of samples taken from patients in Ukraine. Analyses are being performed by two WHO influenza collaborating centres as part of the global influenza surveillance network.

Preliminary genetic sequencing shows that the virus is similar to the virus used for production of the pandemic influenza vaccine, reconfirming the vaccine's efficacy at this time.

Pandemic (H1N1) 2009
Additional questions about the pandemic virus circulating in Ukraine will be answered as more data is available.
WHO commends the government of Ukraine for its open sharing of samples to inform global monitoring of the virus for signs of change.
A total of 34 samples were analysed independently by the WHO Collaborating Centre for Reference and Research on Influenza, Mill Hill in London, UK, and the WHO Collaborating Centre for the Surveillance, Epidemiology and Control of Influenza in Atlanta, Georgia, USA.

(continuation)
Now, I get it!! They ONLY used 34 samples to Test! So, Did they take those samples from those who had the bleeding lungs? Or did they ONLY use those, who had the symptoms of the Swine Flu?

In my opinion - I bet they conveniently chose, used and tested the certain samples they wanted to for the outcome they wanted. Sorry, but the symptoms of what is occurring does NOT match the Swine Flu! I also go back to the fact, if this is the case then WHY did the police Need to take the medical records from the hospitals? Sorry, now I do believe they will hide the truth – this report ultimately boils down to them saying "Take the Vaccine"!

I now question if the Truth will ever come out - Maybe some Biologist will do testings on the samples from people who have died with the bleeding lungs. But I guess they will fear for their lives at the same time, since being a Biologist in the last few years has been a very dangerous profession to be in, with all the deaths/murders that have occurred of them.

WHO said today that the swine flu virus has not mutated to become more lethal

The Flu Case, 18 November 2009.
https://web.archive.org/web/20100102035001/http://theflucase.com/index.php?option=com_content&view=article&id=1857%3Awho-says-swine-flu-has-not-mutated-in-the-ukraine-no-killer-virus-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO said an analysis of 34 samples of "novel pandemic virus samples" from the Ukraine by WHO's Global Influenza Surveillance Network revealed no substantial changes in genetic sequencing.

The news that the mild swine flu virus has not mutated to become more virullent will fuel speculation that the many of the deaths reported recently in the Ukraine were due to pneumonic plague as stated by some doctors.

The origin of the outbreak of plague is not clear but WHO and other organisations were carrying out plague bioterrorism exercises in the Ukraine shortly before the outbreak was reported.

The Ukrainian government moved quickly to implement military style rule on the news of a plague "outbreak", suspending elections, closing borders and arresting "vaccination" opponents as the country readies for a mass swine flu vaccination campaign under WHO's direction.

THE FLU CASE

Has WHO told the truth about the swine flu virus?

The Flu Case, 18 November 2009, 20:40
https://web.archive.org/web/20100102041355/http://theflucase.com/index.php?option=com_content&view=article&id=1865%3Ahas-who-told-the-truth-about-the-swine-flu-virus&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO has said it has found no significant changes to the swine flu virus after examining samples from the Ukraine, that is to say, WHO claims the swine virus continues to be mild.

However, emails are coming in which disagree with WHO and say the virus has become more virulent:

"One of the two small mutations theorized to be in the Ukraine samples has been confirmed.

D225G a receptor binding domain change makes the swine flu much more virulent in the lungs.

This mutation brings the H1N1 virus closer to the 1918 virus as it was in the third and deadliest wave.

Two samples from Brazil also contained this and one other small mutation.

This mutation has no effect on transmission of the virus and will not impact the function of the vaccines against the virus. It does mean that more of the infected will die from the various lung symptoms described so many times in this thread," says one email.

RBD D225G in China and Australia Raise Ukraine Concerns

Recombinomics Commentary, 18 November 2009, 14:41
https://forums.delphiforums.com/ironbubble/messages?msg=109.850

The recent outbreak in Ukraine has raised concern that receptor binding domain changes are responsible. Although WHO has issued a new Ukraine situation update and has addressed preliminary changes in a news conference, they have not rule out receptor binding domain changes, and the recent announcement of investigations by two WHO Regional Centers (NIMR in Mill Hill, UK and CDC in Atlanta GA) suggests single nucleotide changes are under investigation.

One such change is the receptor binding domain polymorphism D225G which is present on recently released sequences from China and Australia. The HA sequence from China, A/Zheijiang/DTID-ZJU03/2009, is virtually identical to two earlier sequences from Yiwu (A/Zhejiang/DTID-ZJU02/2009 and A/Zhejiang-Yiwu/11/2009) and all were collected in September and appear to be from the same patient or contacts. The patient eventually recovered, but was seriously ill and hospitalized for several weeks. However, the three sequences from Yiwu match (see list here) sequences from an isolate, A/Hangzhou/1/2009, that is in another location in Zheijiang (see map), indicating D225G was appended onto the Hangzhou genetic background via recombination.

A sequence released Monday at GISAID by the WHO regional center in Australia, A/Sydney/2503/2009, also has D225G, but on a different genetic backbone. The 5' end of the gene matches isolates from Singapore and Japan (see list), which do not have D225G. Thus, D225G is appended onto this background via recombination, but the background in Australia is distinct from the background in China.

Similarly, the two genetic backbones described above are distinct for two isolates in Sao Paulo, which were from fatal cases. The lung isolates signal the jumping of D225G from one genetic backbone to another. This concurrent acquisition has been described in H5N1, as well as the genetic hitchhiking of H274Y in seasonal H1N1.

This jumping of the same polymorphisms form one background to another signals major changes, especially when the polymorphism "in play" is a receptor binding domain change, which is cause for concern.

The recent activity in Ukraine raises concerns that similar changes are in play there, and the failure of WHO to release the sequences or comment on receptor binding domain changes significantly increases these concerns.

УКРАИНСКАЯ ПРАВДА

Свиной грипп потихоньку сдает позиции

Украинская Правда, 19 ноября 2009, 14:02
https://www.pravda.com.ua/rus/news/2009/11/19/4515026/

Вопрос о прекращении ограничительных карантинных мер по Украине будет рассмотрен в пятницу.

Об этом в четверг рассказал главный санитарный врач Александр Биловол.

"Может быть, что мы промониторим ситуацию, примем решение об отмене ограничительных мер, а в некоторых регионах, возможно, областях и районах останутся эти меры на определенное время", - сказал он.

Вместе с тем первый заместитель министра здравоохранения Василий Лазоришинец сообщил, что в Украине лабораторно подтверждены 226 случаев заболевания калифорнийским гриппом.

Он также отметил, что за все время от свиного гриппа умерли 17 человек. Кроме того, он сообщил, что за весь период эпидемии в Украине гриппом и ОРЗ заболели 1 млн 502 тыс человек, в том числе за последние сутки – 44 тысячи.

"В сравнении с предыдущими сутками количество больных постепенно уменьшается", - сказал он.

Вместе с тем Лазоришинец заявил, что сначала эпидемии уже выздоровели 1 млн. 120 тысяч человек.

"Ситуация стабилизируется и количество регионов, в которых эпидемиологический порог не превышен составляет 12", - сказал он.

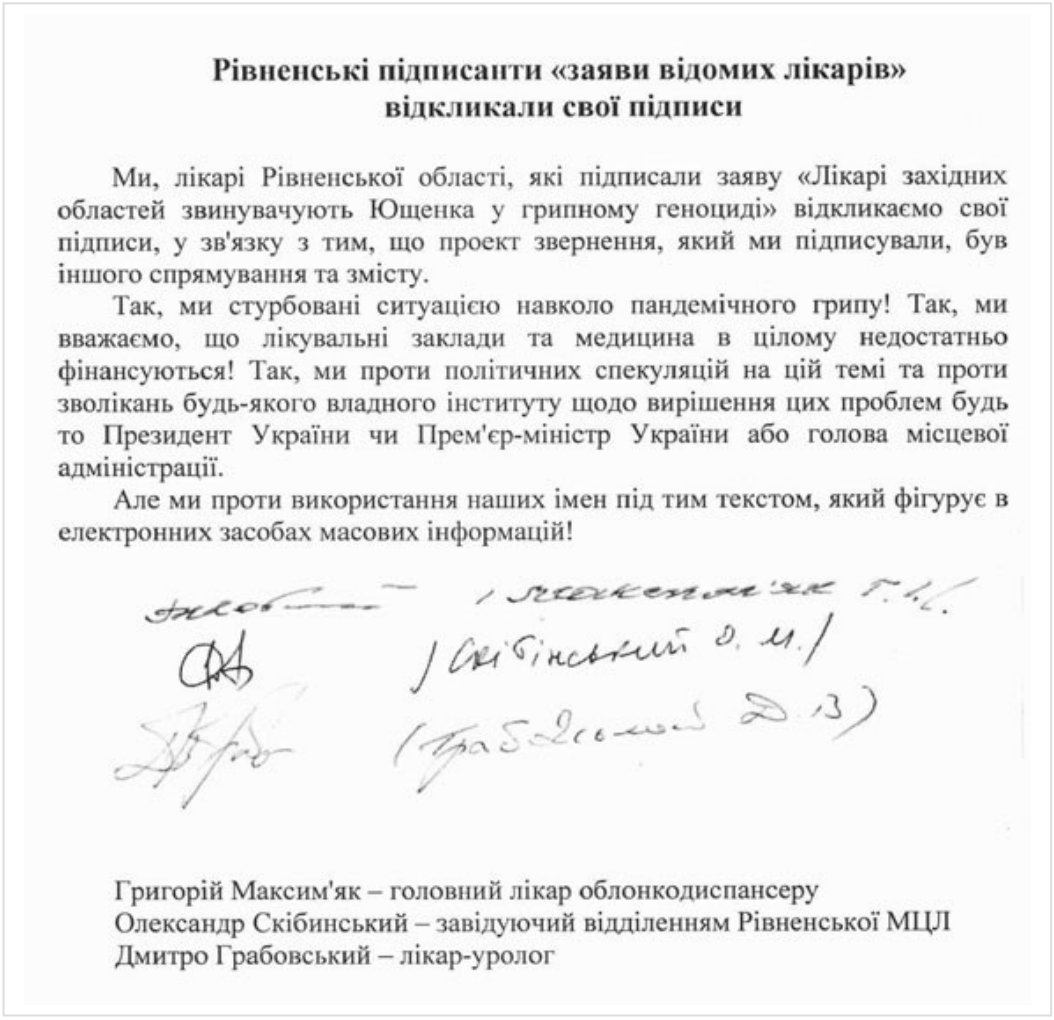
Врачей, подписавших Заявление по гриппу, принуждают отзывать свои подписи?

Рупор, 19 ноября 2009, 16:26.

https://web.archive.org/web/20091122093739/http://rupor.info/news-obshhestvo/2009/11/19/vrachej-podpisavshih-zajavlenie-po-grippu-prinuzhd/

Врачи западных областей, подписавшие недавно Заявление, в котором ставится под сомнение естественный характер нынешней эпидемии гриппа, поразившей именно западный регион, оказались под давлением не только со стороны своего руководства. К примеру, как уже сообщалось в прессе, сотрудник СБУ в Львовской области, в «беседе» с одним из подписантов назвал Заявление врачей «диверсией против власти». Не секрет, и в Украине исторически сложилось, что «беседы» с представителями правоохоронных органов ничего хорошего человеку, который открыто высказал свое мнение, как известно, не несут. В цивилизованных странах подобные вещи прямо характеризуются, как давление личность.

Скорее всего, результатом такого давления и стал документ распространенный сегодня в Ровно и некоторых других западных областях, в котором три врача подписавших Заявление отзывают свои подписи по причине, что они подписывали текст «другой направленности».



Рівненські підписанти «заяви відомих лікарів» відкликали свої підписи

Ми, лікарі Рівненської області, які підписали заяву «Лікарі західних областей звинувачують Ющенка у грипному геноциді» відкликаємо свої підписи, у зв'язку з тим, що проект звернення, який ми підписували, був іншого спрямування та змісту.

Так, ми стурбовані ситуацією навколо пандемічного грипу! Так, ми вважаємо, що лікувальні заклади та медицина в цілому недостатньо фінансуються! Так, ми проти політичних спекуляцій на цій темі та проти зволікань будь-якого владного інституту щодо вирішення цих проблем будь то Президент України чи Прем'єр-міністр України або голова місцевої адміністрації.

Але ми проти використання наших імен під тим текстом, який фігурує в електронних засобах масових інформацій!

Григорій Максим'як – головний лікар облонкодиспансеру
Олександр Скібинський – завідуючий відділенням Рівненської МЦЛ
Дмитро Грабовський – лікар-уролог

Заява
відомих лікарів, представників медичної науки, організаторів охорони здоров'я західних областей України.

Безпрецедентними маніпуляціями над суспільною свідомістю громадян України уже важко здивувати. Політики в одурманенні людей не обирають ні засобів, ні методів, і це, на жаль, головний діагноз української політики.

Однак, те, що твориться останнім часом, не тільки переходить будь-які межі моралі, яка давно уже виведена із політичного вжитку, а становить загрозу безпеці та життю громадян. Більше того, ми маємо підстави стверджувати про пряме посягання на людське життя.

Як фахівці у своїй сфері, ми не можемо у зв'язку із тим, що відбувається, не поставити запитання, які давно висять у повітрі, які цілком резонно задають як лікарі, так і пацієнти, які просто потрясають свідомість.

Епідемія грипу, як би це жорстко не звучало, - річ, на жаль, невблаганна. Поширення грипу в осінньо-зимовий період не знає обмежень ні у просторі, ні у часі, і святий обов'язок лікарів – звести до мінімуму згубні наслідки недуги. Так було вчора, сьогодні і, очевидно, по-іншому не може бути завтра.

І не в залежності від того, на території якої держави це відбувається. Така об'єктивна природа того прикрого явища, яке ми називаємо епідемією.

Однак, події в Україні дають підстави для поважного сумніву саме у природності епідемічних процесів. Якраз є більше підстав стверджувати, що цьогорічна епідемія та політична істерія навколо неї носить не природний, а штучний, тобто організований характер.

По-перше, чому вірус каліфорнійського грипу появився тільки у західній Україні? Звідки взялися такі «розумні» віруси, які не переступають кордони областей? Наука вірусологія і епідеміологія пояснення цьому не може дати.

Зі всією очевидністю виглядає, що спалах епідемії відбувся миттєво на окремо взятій території, а це могло статися внаслідок цілеспрямованих дій. Тобто штучного мору людей страшним штамом, названого каліфорнійським.

По-друге, чому була обрана саме ця територія? Чому тою окремо взятою зоною, яка була піддана атаці, не виявився будь-який інший регіон України чи навколишніх держав?

І, врешті, чому епідемічне загострення синхронно співпало із загостренням президентської кампанії?

Не має сумніву, що відповіді на ці запитання треба шукати уже не в медичній, а у політичній сфері. А що тут відбувається? Секретар РНБО, а також чільні речники канцелярії діючого президента заявляють, що на основі епідемії у західній Україні треба ввести у державі надзвичайний стан. Дружнім хором їм підспівують так звані силовики із генеральськими енкаведистськими погонами.

А що таке надзвичайний стан у їхньому розумінні? Це перенесення президентських виборів, а значить продовження перебування на посаді Віктора Ющенка, шанси якого виграти вибори 17 січня рівні нулю.

Отак вимальовується цілісна операція збереження на посаді політика-банкрота ціною життя невинних людей. А те, що створити штучну епідемію, - справа елементарна, розуміє кожен. Було би бажання і не було би совісті і відповідальності перед Богом.

Ми як лікарі не будемо наголошувати на тому, що мова йде про ту територію держави, на якій живуть переважно виборці одного із кандидатів у президенти і на котрих безуспішно претендує інший кандидат.

THE FLU CASE

Doctors in the Ukraine accuse President of Genocide

The Flu Case, 23 November 2009, 09:52

https://web.archive.org/web/20100102010207/http://theflucase.com/index.php?option=com_content&view=article&id=2021%3Adoctors-in-the-ukraine-accuse-president-of-genocide&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Doctors in the Ukraine have accused the President, Viktor Yushchenko, and his agents of committing genocide in a letter published on the Ukrainian website Rupor Info, sparking fears that the reports of the deaths of thousands of people from artificially created pandemics and vaccinations are true.

The doctors accused the Yuschchenko of deliberately creating "epidemics" in specific regions for political reasons.

By the ploy of pandemics, the doctors say Yushchenko was able to postpone elections he would have almost certainly lost, declare martial law and remain in power as president.

The doctors who signed the letter have been forced to withdraw it.

The letter has ignited fears that many more people have died inside the quarantine zones set up in the Ukraine than the government-controlled media is reporting.

Sources in Poland are reporting that many people who are sick in the Ukraine received vaccinations.

One source reported that 99% of the people who came down with an unusually severe sickness were vaccinated.

After a vaccination with what appears to be the seasonal flu with an HIN1 virus, they became sick in 2 to 3 weeks and infected their family.

According to sources, 200,000 people in the Ukraine got a flu shot, resulting in an epidemic of sickness.

An especially severe flu gripping Poland also appears to be associated with the seasonal flu jab, with an H1N1 virus, according to the package.

Last week a woman reported thousands of people had been killed by vaccines inside closed-off quarantine zones inside western Ukraine.

Iowa and North Carolina reports raise fears H1N1 mutations have reached United States

InfoWars // Prison Planet // Bird Flu Pandemic, 25 November 2009
https://web.archive.org/web/20091129132449/http://www.infowars.com/iowa-and-north-carolina-reports-raise-fears-h1n1-mutations-have-reached-united-states/

New reports from Iowa and North Carolina are raising concerns that the deadly H1N1 swine flu mutations that have been confirmed by the WHO in Ukraine, Norway and elsewhere have already reached the United States. In Iowa, a report that doctors are seeing "very heavy, wet hemorrhagic lungs, lungs with a lot of blood in them" in H1N1 patients is creating concerns among health experts that the deadly Ukraine H1N1 has already spread there.

In addition, a report of Tamiflu-resistant H1N1 swine flu in North Carolina is raising questions about the ability of medical authorities to combat H1N1 if thousands of people do start dying. If deadly H1N1 swine flu mutations have already reached the United States, what does that mean? Doctors in Ukraine have been reporting that victims of H1N1 there are experiencing violent hemorrhaging in their lungs. As the patients near death, their lungs reportedly become as "black as charcoal" and literally begin to disintegrate. Will this start happening soon inside the U.S.?

The news report causing the most concern today is the one about H1N1 patients in Iowa. Commenting on a dramatic spike in H1N1 deaths in Iowa, Dr. Gregory Schmunk told KCCI news that what doctors there are seeing "is very heavy, wet hemorrhagic lungs, lungs with a lot of blood in them."

Hemorrhagic lungs that are filled with blood?

That sounds precisely like what is taking place in Ukraine.

Last week, the WHO confirmed that an H1N1 mutation had been discovered in Ukraine. This H1N1 mutation involved a receptor binding domain change, and it is apparently causing the H1N1 virus to become much more virulent.

Just like the new report in Iowa, many victims of H1N1 in Ukraine have been experiencing violent hemorrhaging in the lungs. Temperatures inside the lungs of patients in Ukraine have been reported to be as high as 135 degrees Fahrenheit. As the patient near death, the lungs turn to mush and literally become as black as charcoal.

In fact, one doctor in Western Ukraine was quoted as saying the following about what is happening to the lungs of these patients…..

"We have carried out post mortems on two victims and found their lungs are as black as charcoal. They look like they have been burned. It's terrifying."

If that wasn't bad enough, the WHO has now confirmed that the same H1N1 mutation has shown up in Norway.

Norway's Institute of Public Health has released a statement in which they announced that this mutation "could possibly…cause more severe disease" because it apparently infects tissue deeper in the airway than usual.

Not only that, but today Hong Kong's Department of Health has confirmed that it has found the same mutation in a H1N1 flu virus sample as the one detected in Norway recently.

Hong Kong is on the other side of the world from Ukraine and Norway.

What in the world is going on?

Nobody knows for sure, but the truth is that the increasing similarities between the current H1N1 outbreak and the 1918 "Spanish flu" outbreak are becoming too striking to ignore.

Firstly, both the current outbreak and the 1918 Spanish flu are from the H1N1 family.

Secondly, both the current outbreak and the 1918 Spanish flu have the same mutation that is currently being reported in Ukraine, Norway and Hong Kong.

Thirdly, the hemorrhagic deaths that victims are experiencing in Ukraine closely mirror the kind of deaths experienced by victims of the 1918 Spanish flu. Just consider the following description of 1918 Spanish flu deaths from Wikipedia…..

"One of the most striking of the complications was hemorrhage from mucous membranes, especially from the nose, stomach, and intestine. Bleeding from the ears and petechial hemorrhages in the skin also occurred." The majority of deaths were from bacterial pneumonia, a secondary infection caused by influenza, but the virus also killed people directly, causing massive hemorrhages and edema in the lung."

You would think this stunning information would be so important that the mainstream media would be all over it, but sadly that is not the case. Instead they seem intent on covering the opening of the "New Moon" movie and whatever Barack Obama had for breakfast this morning.

But not only is the mutation discussed above a tremendous concern, but now there are confirmed reports that Tamiflu-resistant H1N1 is spreading.

Recently a Tamiflu-resistant strain of the H1N1 swine flu was reported to have been discovered in Wales, and now a Tamiflu-resistant cluster of the H1N1 swine flu has been reported in North Carolina.

However, medical authorities don't seem overly concerned. Dr. Alicia Frye, epidemiologist in the CDC's flu division, said in a prepared statement that "at this time we don't have any information that should raise concerns for the general population."

If the best drugs medical authorities have will soon not work against H1N1, perhaps the public should be concerned.

Meanwhile the European Center for Disease Control and Prevention has announced that swine flu deaths in Europe are doubling every two weeks.

Swine flu deaths in Europe are doubling every two weeks?

Perhaps the mainstream media should start paying attention to this.

Posted below is one of the very few mainstream media video reports we have about the "black lung" flu that is ravaging Ukraine…..

All of this is happening at a time when environmental extremists are pushing the "overpopulation" myth harder than ever. In fact, the United Nations Population Fund has just released its annual State of the World Population Report in which it openly calls for reducing world population growth as a way to combat climate change. The reality is that if a deadly H1N1 mutation did kill tens of millions, many very sick environmental extremists would actually applaud. Increasingly, many in the environmental community are viewing humanity itself as a "disease" that needs to be eradicated for the good of the earth.

Talk about a dangerous belief system.

Iowa has recorded a spike in swine flu deaths at 21. Dr. Gregory Schmunk, Polk county's medical examiner, has said people are dying of symptoms similar to the kind reported in the Ukraine. In the autopsy, what we're seeing is very heavy, wet hemorrhagic lungs, lungs with a lot of blood in them," said Schmunk.

Iowa's announcement of appearance of virulent Swine Flu virus spells trouble ahead

Radaris, 27 November 2009

https://radaris.com/p/Greg/Schmunk/

Iowa has recorded a spike in swine flu deaths at 21. Dr. Gregory Schmunk, Polk county's medical examiner, has said people are dying of symptoms similar to the kind reported in the Ukraine. "In the autopsy, what we're seeing is very heavy, wet hemorrhagic lungs, lungs with a lot of blood in them," said Schmunk.

But where did this virulent virus come from all of a sudden?

According to doctors in the western Ukraine, the sudden appearance of the virulent California H1N1 virus in western Ukraine could not be explained by natural processes.

In an open letter, printed in the Ukraine media (a translation was published on this week on this website), doctors accused President Victor Yushchenko of genocide by means of the use of the introduction of an artificial virus for political gain.

Can the appearance of the virus in Polk Country also be explained by natural processes?

Or could this also be an artificial virus introduced by means of vaccinations and used to justify a government clampdown?

It is not clear how many people who came down with the virulent swine flu in Polk County had previously taken the swine flu jab.

Dr Gregory Schmunk does, however, encourage everyone to take the „swine flu" jab as protection against this flu even though there is no proof that it is safe or efficacious while there is significant proof it causes damage, in the meantime.

Will the US government now quickly move to lift the ban on the use of stockpilies of the dangerous adjuvants under the pretext of a pandemic emergency as people panic?

Adrian Gibbs, Australian virologist, this week published futher evidence the swine flu virus is artificial, giving indirect support to the assertion of the Ukrainian doctors.

Also, we know from documents that US researchers went to Alaska in 1995 to dig up the corpse of the victim of the Spanish Flu Pandemic, extract genetic material from the lung and reconstruct the virus in their lab. The team published updates on their progress in „Nature" and other scientifc journals.

The appearance of this artifical virus in western Ukraine was used as a pretext to generate panic and implement martial law, allege the doctors in their letter.

Yushchenko moved quickly to suspend elections he was almost certain to lose, impose quarantines on nine zones and close some borders in coordination WHO.

There have since been unconfirmed reports of mass deaths through forced vaccinations within those quarantine zones.

For sure, isolating specific areas, cutting it off from supplies, and outside communications and then sending in special pandemic task forces to carry out forced vaccinations is an easier way of approaching the problem of killing large numbers of people than taking on the whole of a country at once.

But would the Iowa authorities or the US government ever carry out any such a criminal plan as the Ukrainian?

It is a fact President Barack Obama declared a national emergency over the swine flu pandemic on October 23rd, although the laws allowing forced quarantine and forced vaccination have yet to be activated.

Pandemic drills have been reported.

As in the Ukraine, the US government, however, needs a pretext to implement a drastic crackdown.

The deaths from the virulent form of the swine flu reported in Iowa and North Carolina could supply some of that pretext, though reports of more "infected" areas can be "expected" soon if adequate fear and confusion is to be generated.

An Iowa quarantine order surfaced this summer revealing that the authorities there are prepared to crack down on people in a pandemic emergency.

Failure to comply with this Quarantine Order can lead to arrests, fines, and imprisonment. Anyone suspected of even having contact with some with a pandemic flu can be quarantined indefinitely with very limited access to the outside world.

The blank template of Iowa’s Facilty Quarnatine Order was developed with the help of the Center for Disease Control (CDC), which has published the document on its website. Together with FEMA and Homeland Security, the CDCis the main federal agency responsible for implementing a crackdown in the event of a swine flu pandemic.

This is just one of a raft of drastic measures that have been introduced at state and federal level allowing the US government to force vaccinate and quarnatine people.

800 FEMA camps are reported to be in place in the USA ready to operate incinerators. FEMA trains are waiting on their tracks. Large quantities of plastic coffins have been reported.

In short, the entire infrastructure of mass murder that was in place in Nazi Germany is in place in the USA today - and the banksters and Bilderbergers with their back to the wall are desperate to use it before they end up being prosecuted once the Audit the Fed Bill goes through.

As in Nazi Germany, the US media just like the European media today, though, largely acts as propaganda instrument hiding the stark reality from people of.

It is left to the independent media to warn people of the impending danger.

The independent media and bloggers have to carry out the role of the horsemen who raced between towns carrying a lantern to light up the night during the First American Revolution to warn people the British were coming and so allowing them time to prepare to defend themselves.

It sure looks like the "colonial British" are determined to impose their will again but this time, they have turned up armed with vaccines and quarantine orders as well as guns.

Just as during the First Revolution, they are finding plenty of people who will do their work for them on US soil.

But the "British" will not succeed any today than they did the first time if enough people stand up and fight back in this still undeclared biological war against the people, targetting children with especial cruelty and deceit.

It is time to listen to see the warning signs and recognise we really are at war with the globalist banksters. They really do want to impose an autocratic UN/WHO government at our expense under a pandemic pretext. The time really has come for us to prepare for our defence in the US and Europe.

How long until we hear the virulent swine flu virus has killed 27 people in Norway or Spain or Austria?

Every single person has a role to play in this great battle between the power of lies and deceit and the truth. It could be YOU who makes the difference.

ДУРДОМ

Князевич:
Нет гарантии, что завтра украинцы не начнут умирать потому, что не привились

Дурдом, 27 ноября 2009, 14:15:04
https://durdom.in.ua/ru/main/news_article/news_id/13311.phtml

Министр здравоохранения Василий Князевич не исключает возможности срыва кампании вакцинации от гриппа A/H1N1 в связи с недоверием населения и дискредитации подобных превентивных мер после случая со смертью школьника из Краматорска. Об этом он заявил в интервью газете *Урядовий кур'єр*. – "Такая угроза (срыва кампании вакцинации) вполне реальна. После антивакцинальной кампании мы имеем проблемы даже с обязательными прививками, не говоря уже о добровольных, которые были не слишком популярны среди наших граждан... Сегодня все испуганы вспышкой гриппа, но нет гарантии, что завтра украинцы не начнут умирать от инфекций только потому, что поддались влиянию антивакцинальщиков", - сказал Князевич.

Комментируя ситуацию с внеплановой (дополнительной) иммунизацией против кори и краснухи, Князевич подчеркнул, что ее начало было запланировано еще на осень 2007 года. "Минздрав Украины... подтвердил готовность провести в 2007 году кампанию дополнительной иммунизации и дал согласие на ввоз и использование 9 млн доз вакцины (вакцина против кори и краснухи производства Индийского института сывороток) без ее регистрации как гуманитарной помощи, что соответствует действующему законодательству", - проинформировал он, добавив, что качество вакцины "путем переквалификации гарантировано ВОЗ".

Однако, по словам министра, соответствующее распоряжение не было подписано в 2007 году. Вместо этого было подписано распоряжение, утверждающее план мероприятий дополнительной иммунизации против кори и краснухи на 2008 год.

Князевич в очередной раз заверил, что смерть школьника Антона Тищенко из Краматорска "не связана с вакциной или вакцинацией".

Глава украинского Минздрава также прокомментировал реакцию ВОЗ и ЮНИСЕФ на решение о невозможности использования в Украине в 2009 году вакцины против кори и краснухи, предоставленную в качестве гуманитарной помощи. В частности, он напомнил, что ранее министр экономики и финансов Великобритании Гордон Браун приложил много усилий, чтобы убедить международных доноров выделить Украине средства на проведение кампании по дополнительной иммунизации, в то время как десятки стран намного беднее украинского государства и тоже ожидали вакцину.

"Мне сложно сказать, будет ли ВОЗ идти навстречу Украине, как это было раньше, и бесплатно предоставлять вакцину. Пока что мы стоим в очереди на вакцину против калифорнийского гриппа, как и сотни других стран. На сегодняшний день только две страны (Россия и Канада) предоставили нам материалы для начала процедуры регистрации вакцин от гриппа", - сообщил Князевич. По словам министра, дополнительной вакцинации против кори и краснухи в 2009 году не будет, что, согласно прогнозам эпидемиологов, может привести к вспышкам кори и краснухи в 2010-2011 годах.

Как сообщалось, Кабинет министров Украины утвердил план иммунизации населения против гриппа на 2009-2010 годы и создал координационный совет по реформированию системы здравоохранения. Эксперты Всемирной организации здравоохранения в результате расследования не установили причинно-следственной связи между смертью школьника из Краматорска и его вакцинацией.

The Cutting Edge

Martin Barillas

Swine Flu mutates into new diseases and into Political Issues

The Cutting Edge, 30 November 2009
https://web.archive.org/web/20200925210821/http://www.thecuttingedgenews.com/index.php?article=11820

Reports in Europe and elsewhere are rife of a mutation of the H1N1 “swine flu" virus that apparently first appeared in Ukraine and has now popped up in numerous other countries. As of November 28, two fatal cases of the mutated virus emerged in France, following two deaths caused by the virus identified in Norway on November 20. According to the World Health Organization, the same virus has been identified in patients in other countries including Brazil, China, Japan, Mexico, and the United States.

So far, in France, 76 deaths have been recorded for H1N1. Worldwide, deaths blamed on the epidemic rose by 1,000 during the week of November 21-28. But in the Ukraine, the total figure surpassed 300 in early November 2009, with as many as 16 deaths caused in one day.

The mutated virus appears to be able to penetrate further into the passages of victim’s lungs, thus making it more dangerous. However, there is yet no evidence to show that it can be spread between people. As long as there is no proven “person-to-person” contagion, the relative risk posed by the mutation is low, experts insist.

It is obvious that the mutated flu causes special complications, as demonstrated by the deaths caused in Norway and France. Viruses typically mutate within their victims, thereby reproducing. It has been suggested that the fact that this mutation has been identified in at least 6 different countries merely shows that it is one of the possible mutations that can emerge.

However, H1N1 deaths may increase as its mutations combine. The permutations are many. Some mutations are vaccine- and antiviral-resistant, while another causes lung hemorrhaging. Each mutation is causing different effects in victims, and even combining to attack individuals in some cases. In the UK, a laboratory reported that the current H1N1 vaccine would probably not be effective against the variant of the swine flu virus that caused a panic in Ukraine. This variant, in which the virus uses D225G as a receptor binding domain, causes bleeding in the lungs. Another

H1N1 mutation results in the resistance to treatment with antiviral medication. The mutation that results in acute lung damage has been called a "low reactor" to the vaccine, meaning that the vaccine will not provide an immune response for that strain of virus adequate to prevent infection.

Lung hemorrhaging caused by a swine flu mutation has been reported from China and Norway to France and the Ukraine. Thus far in the United States, there have been unconfirmed reports of fatalities in patients with hemorrhaged lungs. Worldwide, a strain of the H1N1 bug resistant to Tamiflu, a principal anti-viral medication, has been found with high incidence in Wales and North Carolina. One such case has been found in France. About 80 million doses of vaccine have been distributed worldwide and about 65 million people have been vaccinated so far, according to the World Health Organization (WHO).

News of the H1N1 flu, aside from any mutations, has captured headlines and blogs over the planet as international organizations such as WHO, and national governments struggle to respond. Near panic has gripped Ukraine where millions rushed to buy doses of Tamiflu and other anti-viral medications as well as surgical masks to avoid contagion. Schools and all universities there have been closed and nine regions of the country were put under quarantine. Bolstered by alarmist media reports in Ukraine, there was much talk in the media and on the street about deliberate infection by pharmaceutical companies or the government as conspiracy theories became rife. For example, some argued that flights of helicopters and fixed-wing aircraft had been seen spraying the populace with clouds of unknown substances feared to be the virus itself. Reports also emerged that the lungs of the mutated virus' victims had turned black as coal while the death toll rose. Hospitals are being converted into emergency treatment centers, having been caught off guard by the deaths of 400 people in just three weeks.

In the Ukraine, the virus became political. Reports of the flu, and the government response, comes in the midst of a presidential election that pits as opponents the incumbent President Victor Yushchenko, incumbent and former ally Prime Minister Yulia Tymoshenko, against a Russian-backed rival. Tymoshenko, who has been blamed for a faltering economy and pandering to Russia, has capitalized on (or even fostered) the panic in Ukraine for political gain, according to some observers. Political observers also noted the competing appearances by the two politicians at hospitals and the bedsides of sufferers. Tymoshenko and two her ministers personally and ceremoniously received a Tamiflu air shipment in the middle of the night in early November, and she has given assurances that her government has the situation well in hand. Some polling data suggests that this apparent concern has not availed the natural gas tycoon: one poll has her trailing a rival by nearly 2 to 1. Tymoshenko has also banned all mass gatherings and political rallies – after she had already had hers.

Although the World Health Organization concluded that "the numbers of severe cases do not appear to be excessive when compared to the experience of other countries," pharmacies ran out of surgical masks and medicines whiles panicked Ukrainians dangerously hoarded supplies as Tymoshenko sprang into action and dominated media reports. This is opportune for Tymoshenko, who had been thought to be losing the race to Russia's candidate Viktor Yanuovich – a man many Ukrainians believe may have been linked to an assassination attempt on Yushchenko. As Ukrainian GDP contracted by over 15 percent in the third quarter of 2009 and Tymoshenko continued to bicker with Yushchenko, her approval ratings plummeted from a high of 47 percent in the spring of 2005 to just 14 percent in October – an improvement from summer 2009. Tymoshenko's prospects are now much brighter, given that at least the first wave of contagion has been stemmed before the January 2010 election. Medical experts expect the flu season to peak again in January and February. A Tymoshenko spokesman has disavowed any suggestions that the president made political capital out of a medical crisis but has managed to bolster a faltering medical system and prepared it for further flu contagion.

Flu season or not, the outcome of the January 2010 Ukrainian election is critical to both Russia and the West. Both Tymoshenko and Yushchenko favor Ukraine's admission to NATO and the EU. Before becoming Prime Minister in a second term that began in 2008, Tymoshenko stated in a Foreign Affairs essay of the need for a buffer between Russia and the West while offering Ukraine

into the bargain. Yushchenko is married to a woman who had been a US citizen and a Reagan-era official in the State Department. He enjoyed good relations with President George W. Bush and set a course for Ukraine that has been at odds with his Russian neighbor.

On November 27, the Ukrainian parliament failed to over-ride Yushchenko's veto of a $125 million package of aid in the flu epidemic. He said he supports putting additional funds toward fighting the flu, but was against the way the government wanted to finance the increase, arguing that the proposed law could also lead to the devaluation of the national currency. Prime Minister Yulia Tymoshenko criticized Yushchenko and said he bears full responsibility for flu casualties in Ukraine.

Russia has also had its share of flu deaths and reaction to infection. At least ten universities in western Russia have been closed due to the flu. The State Pedagogical University in the city of Lipetsk said it is canceling classes because about one in four of the university's students are sick with flu-like symptoms, even though they are not known if they have swine flu, or a variant of H1N1. The closure is expected to last until December 2.

But the Mideast has actually been hit the hardest. According to the latest World Health Organization estimates, influenza H1N1 has more victims in Iran than in the other 22 countries of the WHO's Eastern Mediterranean Region. With 33 deaths so far, Iran registers 17 percent of the total 188 deaths in the region since May 2009. Saudi Arabia has recorded 28 deaths, Oman 25 and Syria 22 and also had the highest rate of fatalities in comparison to the cases with 9.5 percent of them being fatal. Yemen follows with a rate of 2.5 percent, Afghanistan with 1.7 percent, and Iran with 1.5 percent. Kuwait has registered the highest number of cases with 6,640 (23 percent of all the 28.751 in the region), followed by Saudi Arabia with 4,119; Oman with 3,829; and Egypt with 2,494. Kuwait also has the highest number of cases per head with 2.46 over a thousand, followed by Oman with 1.12 cases (over a thousand), and Bahrain with 1.10 cases (over a thousand).

In Saudi Arabia, authorities were prepared for the annual Hajj pilgrimage, imposing tight security and anti-flu initiatives. Saudi authorities deployed some 20,000 medical staff and more than 100,000 security personnel as more than 2.5 million Muslim faithful prepared to descend upon the holy cities of Mecca and Medina. Three persons, including an elderly Pakistani, are confirmed victims of the flu. Besides the flu epizootic, the Saudis must contend with tensions between Sunni and Shia Muslims, which in the past caused hundreds of deaths and injuries. In recent weeks, the Saudi government called on Iran not to politicize Hajj after Iran's Supreme Leader Ali Khamenei called for "demonstrations against the United States and Israel."

Local health authorities are on high alert; so far, 20 pilgrims have shown signs of the flu. Four of these died, having had prior health problems like pulmonary infection and cancer. Another four remain in care, and 12 were dismissed from hospital. Over the past few weeks, Riyadh has urged other governments to restrict the pilgrimage to healthy adults between 18 and 65. Additional doctors have been deployed, more hospital beds provided, and some 1.5 million units of Tamiflu stockpiled. Additionally, six 24-hour health clinics are available within the Grand Mosque at Mecca.

The Health Ministry of Israel had registered 51 swine flu deaths as of early November. A two-year-old child from Nazareth died following a swine flu shot; she had had several illnesses and recently received a pacemaker. Another 41 people complained of side effects of the flu jab. The standard for inoculation holds that children under the age of three are not good candidates for the flu vaccine.

In the conflictive Democratic Republic of Congo, an unknown epidemic has caused three deaths and affected more than 100 people. The epidemic broke out in Londela Kayes, in southwest DRC some 300 miles from Brazzaville. Symptoms include diarrhea, strong fever and vomiting. Health authorities on the scene have concluded that they are confronting a flu virus even while they have yet to receive samples. The A/H1N1 has been found in Brazzaville and Pointe Noire and was presumably spread from there. The DRC reported its first case in October at a Brazzaville school.

https://vactruth.com/2009/12/12/billions-in-the-trash-swine-flu-drug-scandal-in-ukraine/

Governments worldwide may have wasted billions of dollars stockpiling an ineffective flu drug. A study published in the British Medical Journal has found no evidence ...

Jean-Jacques Crèvecœur

Jean-Jacques Crevecoeur

What awaits us in 2010?

The Flu Case, 10 January 2010
https://web.archive.org/web/20100315181956/http://www.theflucase.com/index.php?option=com_content&view=article&id=2514%3Aqnothing-will-ever-be-the-same-againq-jean-jacques-crevecoeur-reflects-on-the-swine-flu-scam-translated-by-carolyn-dunning&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Now, what awaits us in 2010? Will I still take the risk of making predictions for 2010? Well yes, although I recognize that exercise is dangerous and risky. For, since my retirement from public life, I have never stopped reviewing documents related to this famous influenza H1N1. What are the facts that have caught my attention? There have been many, here is a summary:

Margaret Chan, General Director for the WHO, announced that the pandemic would last at least until 2011 (ref: L'OMS ne veut pas crier victoire avant 2011. – L'OBS, 29 December 2009;
https://web.archive.org/web/20160205063338/http://tempsreel.nouvelobs.com/la-grippe-a/20091229.OBS2023/l-oms-ne-veut-pas-crier-victoire-avant-2011.html

Ukraine experienced an epidemic of extremely deadly lung disease (death occurring 24 hours after onset) in November 2009. According to the autopsies performed on the corpses of victims, the symptoms were different from those of influenza and the virus that attacked the lungs was different from the H1N1 virus, but by combining with it, became extremely deadly (ref: Yashchenko A. Ukraine: Nouveau virus découvert, mortel pour les systèmes immunitaires affaiblis. – New of Tomorrow, 13/17 Novembre 2009
https://web.archive.org/web/20091121062319/http://newsoftomorrow.org/spip.php?article6802Unian:
https://web.archive.org/web/20091119024614/http://www.unian.net/rus/news/news-346721.html

But what is disturbing about the case in Ukraine is that two months beforehand (in Warsaw, Poland on 29th and 30th September, 2009), Interpol had proposed to six of Central and Eastern European countries a drill *simulating a bioterrorist attack against the Ukraine*, an attack in which the terrorists' modus operandi was to spread a virus of pneumonic plague by air ;
=> International Bioterrorism Table Top Exercise: Warsaw, Poland, 29-30 September 2009
https://web.archive.org/web/20091110084341/http://www.interpol.int/Public/BioTerrorism/tabletop/default.asp

Two months later, thousands of testimonies from the people of Ukraine reported that planes had flown at low altitude during the night, a few days before the outbreak of the deadly epidemic first describes as pneumonic plague. A coincidence?
etc.

False Swine Flu Pandemic

Андрей Алехнович

Свиной грипп к белорусам не пристает

Deutsche Welle, 19 июня 2009, 01:46
https://www.dw.com/ru/%D1%81%D0%B2%D0%B8%D0%BD%D0%BE%D0%B9-%D0%B3%D1%80%D0%B8%D0%BF%D0%BF-%D0%BA-%D0%B1%D0%B5%D0%BB%D0%BE%D1%80%D1%83%D1%81%D0%B0%D0%BC-%D0%BD%D0%B5-%D0%BF%D1%80%D0%B8%D1%81%D1%82%D0%B0%D0%B5%D1%82/a-4408240

В Беларуси случаи заболеваний свиным гриппом пока не зафиксированы. Однако медики принимают превентивные меры, чтобы не допустить возможное проникновение в страну эпидемии.

До сих пор в Беларуси случаев заболевания свиным гриппом зафиксировано не было. Правда, медики приписывать себе каких-либо заслуг за это не спешат, объясняя, что ничего экстраординарного они в деле предупреждения распространения болезни не предпринимают. Сотрудники медучреждений просто принимают необходимые в таких случаях превентивные меры. И надеются, что эпидемия до Беларуси не доберется.

Превентивные меры

По словам врача-терапевта одного из минских медицинских центров Людмилы Карась, медики к встрече со свиным гриппом в плане информированности готовы. По лечебным учреждениям разосланы приказы, в которых указан алгоритм действий. Но реальной угрозы нет, и случаев обращения пациентов за помощью пока не было.

Вместе с тем, как отметила главный эпидемиолог Беларуси Инна Карабан, никаких оригинальных рецептов по предупреждению свиного гриппа в стране не изобреталось. Мероприятия в Беларуси проводятся такие же, как во всех странах - это мониторинг состояния заболеваемости вирусными инфекциями, мониторинг состояния здоровья пассажиров в аэропортах и на железнодорожных санитарно-карантинных пунктах. Кроме того, создан запас лекарственных препаратов, дезинфекционных и других средств.

Но, несмотря на нынешнее благополучие, белорусские медики продолжают надеяться на то, что в скором времени в мире вакцина против свиного гриппа все-таки будет изобретена. И тогда страна также сможет ее закупить.

И для сезонного гриппа – не сезон

Хотя на сегодняшний день особой необходимости в такой вакцине в стране нет. Единственная гражданка Беларуси, заболевшая новой разновидностью гриппа, была госпитализирована в конце мая в Москве. Она прибыла туда из Чехии и собиралась улететь в Италию без посещения родины. А потому непосредственно в Беларуси, по словам Инны Карабан, случаев заболевания нет. И подозрений на заболевание тоже не было выявлено.

По признанию главного эпидемиолога страны, единственный вид эпидемии, которая периодически выбивает белорусов из колеи – это сезонный грипп. Но и для этой болезни сейчас еще не сезон.

Belarus H1N1 Deaths Raise Concerns

Recombinomics Commentary, 3 November 2009, 16:43
https://web.archive.org/web/20091107030459/http://www.recombinomics.com/News/11030901/Belarus_Fatalities.html

The first Belarusian death from swine flu was registered by health officials on Tuesday. The victim, a 37-year-old female resident of the town of Drogichin, died on Friday, but results of blood tests confirming the presence of the H1N1 virus only became available Tuesday, said Oleg Arnautov, chief doctor of the western Brest province.

The woman reportedly had visited Ukraine's western Kovel region, currently near the centre of Ukraine's flu outbreak, in early October.

In recent weeks, the Belarusian capital Minsk has seen an estimated 10 deaths of persons suffering from pneumonia preceded by flu-like symptoms. Public health workers were working to identify the virus causing the illnesses.

The above translation describes the first confirmed H1N1 fatality in Belarus, as well as ten more likely swine flu deaths in Minsk. These deaths are not surprising. Although Belarus has acknowledged 59 confirmed pandemic H1N1 cases, the flu activity is characterized as widespread, and over 99% of influenza A in Europe is swine flu.

The outbreak in western Ukraine (see map) has raised concerns that transmission and virulence has increased. The number of cases may be related to seasonal weather changes. Flu Trends shows that the Ukraine has historically had a jump in cases at this time of year, presumably linked to colder weather and availability or lack thereof of heat for homes. Since virtually all flu in Europe at this time is swine flu, this jump in flu cases would create a jump in swine flu cases. Moreover, the spike this year is markedly higher than prior years, which could explain the increases in hospitalizations and deaths.

However, the hospitalization of more than 15,000 raises concerns that the death toll could increase dramatically. Today's government update has been delayed, but a local media report on Lviv described a sharp increase in cases to 104,019 and an increase in fatalities from 30 to 37.

The above reports of fatalities in neighboring Belarus raises concerns that there are also significant numbers of hospitalized and fatal cases there. There have been some efforts of limiting border crossings out of Ukraine, but it seems likely that the H1N1 associated with these fatal cases has already spread throughout the region.

Sequence data on isolates from fatal cases in the Ukraine and Belarus would be useful.

AFN

Лукашенко о «свинячьем» гриппе и мировом заговоре

АФН, 5 ноября 2009, 16:33
https://afn.by/news/i/127032

"Этот грипп, пусть даже свинячий, - это не чума и холера, он излечим", - заявил сегодня А.Лукашенко в Киеве.

"Я знаю, что происходит в этой суперкоррумпированной, бандитской среде в производстве лекарств. Еще недавно говорили по поводу "птичьего" гриппа. Наверное, все уже продали. Сегодня запищали по-свинячьи. А завтра, наверное, замурлыкаем или замычим?"

Лукашенко заявил, что возникшая в связи со "свиным" гриппом паника среди населения была создана искусственно.

"Мы по часам мониторим ситуацию, и за последние сутки мы видим, что происходит спад о ОРВИ", - сказал Лукашенко, похвалив Минздрав.

"Они вдвойне молодцы, медикам приходится бороться не только с самим заболеванием, но и ажиотажем".

"Мы в состоянии сами справиться, и Украина справится. Не надо бояться, нагнетать ситуацию и обстановку", - заявил Лукашенко.

ДЕЛОВАЯ ГАЗЕТА

Лукашенко:
Раньше весь мир кукарекал, а теперь завизжал по-свинячьи

РИА Новости, 5 ноября 2009, 19:37
https://vz.ru/news/2009/11/5/345638.html
https://lb.ua/news/2009/11/05/13277_lukashenko_kukarekal_ves_mir_t.html

Президент Белоруссии Александр Лукашенко на встрече с президентом Украины Виктором Ющенко заявил, что именно производители лекарств спровоцировали панику вокруг гриппа A/H1N1.

«Вы знаете, я знаю, что происходит в этой суперкоррумпированной среде, бандитской среде торговли и производства лекарствами», - отметил Лукашенко.

«Давайте говорить откровенно - давно мы перестали кукарекать по поводу «птичьего» гриппа. Кукарекал весь мир. Наверное, все уже продали (лекарства), что касается птичьего гриппа, теперь завизжали по-свинячьи. А завтра, наверное, замурлыкаем или замычим? Ну, неужели вы не понимаете, что происходит?», - заметил Лукашенко.

В подтверждение своих слов он привел пример белорусской статистики: «В 2008 году, когда еще ничего не пищало свиным гриппом», от пневмонии умер 21 человек, в этом году - 19, из которых у 6 нашли подозрение на свиной грипп. «Это факты, которые фальсифицировать нельзя», - отметил он.

«Этот грипп, пусть даже свинячий, - это не чума и холера, которые неизлечимы, он абсолютно излечим», - заявил президент Белоруссии.

По его словам, он никогда не думал, что ему как президенту придется обсуждать тему гриппа на таком высоком уровне. Поскольку, по его мнению, этим должны заниматься профессионалы. Он подчеркнул, что сегодня медикам приходится бороться не только с самим заболеванием, но и с ажиотажем вокруг него.

Лукашенко призвал население не поддаваться паническим настроениям, но и не заниматься самолечением.

«Человек серьезно заболел и начинает лечится малиной, вареньем лечится - когда уже поздно и до сорока температура, вместо того чтобы пройти в больницу», - отметил он.

«Мы в состоянии сами справиться, и Украина справится. Не надо бояться, нагнетать ситуацию и обстановку», - заявил Лукашенко, передает УНИАН.

РИА НОВОСТИ

Андрей Лубенский

Лукашенко призвал меньше "визжать" про свиной грипп

РИА Новости, 5 ноября 2009
https://ria.ru/20091106/192113439.html

"Давайте говорить откровенно, давно ли мы перестали "кукарекать" по поводу "птичьего" гриппа? "Кукарекал" весь мир. Наверное, все (лекарства) уже продали. Сегодня завизжали по свинячьи. А завтра, наверное, замурлыкаем или замычим", - сказал Лукашенко.

КИЕВ, 5 ноября 2009 – Причина искусственного ажиотажа вокруг свиного гриппа лежит в коммерческой сфере, считает президент Белоруссии Александр Лукашенко.

Эпидемия гриппа на Украине была объявлена в конце октября, в девяти западных областях введен карантин. По последним официальным данным Минздрава, от гриппа скончались 95 человек. Подтверждены 15 случаев заболевания гриппом A/H1N1. До сих пор в украинских аптеках не хватает антивирусных препаратов и медицинских повязок.

"Давайте говорить откровенно, давно ли мы перестали "кукарекать" по поводу "птичьего" гриппа? "Кукарекал" весь мир. Наверное, все (лекарства) уже продали. Сегодня завизжали по свинячьи. А завтра, наверное, замурлыкаем или замычим. Вы что, не понимаете, что происходит?" - сказал Лукашенко в четверг на совместной с президентом Украины Виктором Ющенко пресс-конференции в Киеве.

По мнению белорусского лидера, "этот грипп, пусть даже свинячий, – это не чума и холера, он вполне излечим", а ажиотаж только мешает в борьбе с болезнью. "Медикам приходится бороться не только с самим заболеванием, но и с ажиотажем", – заявил Лукашенко.

В то же время, президент Белоруссии отметил, что этот ажиотаж выгоден производителям лекарств и торговцам.

"Я знаю, что происходит в этой суперкоррумпированной, бандитской среде в производстве и торговле лекарствами", – подчеркнул он.

"Есть у нас марлевый завод, надо будут марлевые повязки – будем с Виктором Андреевичем вместе там штамповать и развозить. Только вы покупайте", – пошутил Лукашенко, добавив, что через неделю марлевые повязки украинцам уже не понадобятся.

Лукашенко выразил уверенность в том, что и Белоруссия, и Украина вполне в состоянии справиться с проблемой свиного гриппа. "Не надо бояться, нагнетать ситуацию и обстановку", – резюмировал белорусский лидер.

Президент Белоруссии посещает Украину с официальным визитом 5-6 ноября.

ФармАналитик
ЧЕТВЕРТЬ ВЕКА НА ФАРМРЫНКЕ

Лукашенко считает, что свиной грипп выдумали фармацевты

Фарм Аналитик, 5 ноября 2009
https://marketmed.ru/uncategorised/lukashenko-schitaet-chto-svinoj-gripp-vydumali-farmatsevty

Президент Белоруссии Александр Лукашенко считает, что проблема свиного гриппа раздута фармацевтическими компаниями. Об этом он заявил в четверг, 5 ноября, в ходе визита на Украину. "Я знаю, что происходит в этой суперкоррумпированной, бандитской среде в производства лекарств", - сказал белорусский президент на совместной с президентом Украины Виктором Ющенко пресс-конференции в Киеве. "Сегодня завизжали по-свинячьи. А завтра, наверное, замурлыкаем или замычим. Вы что, не понимаете, что происходит?" - сказал Лукашенко.

По мнению белорусского лидера, свиной грипп - это не чума и холера, "он вполне излечим". При этом он отметил, что через неделю марлевые повязки украинцам уже не понадобятся.

В конце октября на Украине была объявлена эпидемия гриппа, в десяти западных областях введен карантин, не проводятся массовые мероприятия по всей стране, на три недели закрыты учебные заведения. По последним официальным данным Минздрава, от гриппа скончались 95 человек. Подтверждены 15 случаев заболевания гриппом A/H1N1, однако Минздрав не уточняет количество смертей от свиного гриппа, хотя ранее сообщалось о трех летальных исходах.

В самой Белоруссии от острой пневмонии за две последние недели скончались 19 человек. По данным Минздрава страны, лишь семеро из них умерли от высокопатогенного вируса гриппа A/H1N1. Все они либо приехали из-за рубежа, либо близко общались с теми, кто только что вернулся в республику.

Александр Лукашенко

Паника вокруг свиного гриппа создана искусственно

DELO, 5 ноября 2009
https://delo.ua/opinions/lukashenko-panika-vokrug-svino-133521/

Президент Беларуси Александр Лукашенко заявил, что проблема вокруг т.н. "свиного" гриппа и возникшая в связи с этим паника созданы искусственно и, в том числе, спровоцированы производителями лекарств

"Этот грипп, пусть даже свинячий, - это не чума и холера, он излечим", - заявил Лукашенко, 5 ноября в Киеве после переговоров с Президентом Украины Виктором Ющенко.

"Я знаю, что происходит в этой суперкоррумпированной, бандитской среде производства лекарств", - сказал белорусский президент.

"Еще недавно говорили по поводу "птичьего" гриппа. Наверное, все уже продали (препараты – "ДЕЛО"). Сегодня запищали по-свинячьи. А завтра, наверное, замурлыкаем или замычим?", - заметил Лукашенко.

Белорусский президент заявил, что возникшая в связи со "свиным" гриппом паника среди населения создана искусственно. В частности, по его информации, "в прошлом году в этот период в Беларуси от пневмонии умер 21 человек, в этом году - 19, из которых у шести нашли подозрение на "свиной" грипп". "Мы по часам мониторим ситуацию, и за последние сутки видим, что происходит спад по ОРВИ", - сказал Лукашенко.

Он призвал население не поддаваться паническим настроениям и отдал должное медикам. "Они вдвойне молодцы. Медикам приходится бороться не только с самим заболеванием, но и ажиотажем", - отметил глава белорусского государства.

"Мы в состоянии сами справиться, и Украина справится (с заболеванием – "ДЕЛО"). Не надо бояться, нагнетать ситуацию и обстановку", - заявил Лукашенко.

В свою очередь, президент Украины Виктор Ющенко заверил: "Мы справимся с этими проблемами". При этом он отметил полное взаимопонимание с белорусской стороной по всем вопросам, касающимся противодействия эпидемии.

Ющенко также сообщил, что "завтра будет наш визит в один из регионов, пострадавших от эпидемии".

President of Ukraine's neighbour says "swine flu" pandemic artificially created

The Flu Case, 6 November 2009, 16:41
https://web.archive.org/web/20100102030710/http://theflucase.com/index.php?option=com_content&view=article&id=1667%3Apresident-of-ukraines-neighbour-says-qswine-fluq-pandemic-artificially-created&catid=1%3Alatest-news&Itemid=64&lang=en

Alexander Lukashenko, the President of Belarus, a country bordering the Ukraine, has said that the panic over the "swine flu" has been artificially created by pharma companies, according to reports in the local media.

realt5000.com.ua
http://realt5000.com.ua

A. Lukashenko

The panic over swine flu created artificially

Realt5000, 6 November 2009, 10:39:41
http://www.realt5000.com.ua/news/utf/en/1154916/ (*deleted*)

President of Belarus Alexander Lukashenko said that the problem around the so-called. "Swine" influenza emerged in connection with the panic created artificially, and including, provoked by the manufacturers of drugs

"This flu, even pig – is not the plague and cholera, it is curable," – said Lukashenko, on 5 November in Kiev after talks with Ukrainian President Viktor Yushchenko.

"I know what is happening in this superkorrumpirovannoy, gangster production environment drugs "- the Belarusian president said.

"More recently talked about the" bird "flu. Probably all already sold (drugs – "BUSINESS"). Today squeaked in pig. And tomorrow, probably, purr or zamychim?" – Said Lukashenko.

Belarusian president said that arose in connection with "swine" flu panic among the population is created artificially. In particular, according to him, "last year in this period in Belarus, died of pneumonia on 21 people this year – 19 of which have found six suspected "swine" flu." "We are on the clock monitor the situation, and the last day we see what happens decline in ARI," – said Lukashenko.

He urged people not to succumb to panic "and paid tribute to the doctors. "Theydoubly fellows. Medics have to contend not only with the disease itself, but Christmas shopping," – said the head of the Belarusian state.

"We are in a position to cope, and Ukraine on the right (with the disease – "BUSINESS "). Do not be afraid to escalatesituation and environment "- said Lukashenko.

In turn, the Ukrainian President Viktor Yushchenko assured: "We will cope with these problems." He noted a complete mutual understanding with the Belarusian side on all issues relating to counterepidemic.

Yushchenko also said that "tomorrow will be our visit to one of the regions affected by the epidemic."

Президент Республики Беларусь

Официальный визит в Украину

Президент Республики Беларусь, 6 ноября 2009
https://president.gov.by/ru/events/otnoshenija-belarusi-i-ukrainy-vse-bolshe-priobretajut-xarakter-strategicheskogo-partnerstva-4850

Отношения Беларуси и Украины все больше приобретают характер стратегического партнерства. Государства сняли все проблемные вопросы в отношениях и завершили формирование договорно-правовой базы, которая насчитывает 70 документов по взаимодействию на различных уровнях. Таковы результаты прошедших 5 ноября в Киеве переговоров президентов Беларуси и Украины Александра Лукашенко и Виктора Ющенко.

Глава белорусского государства 4-6 ноября находится с официальным визитом в Украине.

Это уже четвертая встреча Александра Лукашенко и Виктора Ющенко в этом году. Президенты общались в январе в Чернигове, в мае в Гомеле и в октябре в Кишиневе в рамках саммита СНГ. ...

Была также затронута актуальная в последние дни тема заболеваемости населения гриппом и ОРВИ.

Как считает Александр Лукашенко, ажиотаж вокруг этого создан искусственно. "Я поинтересовался, что происходило в Беларуси в этот период в 2008 году. Тогда от пневмонии умер 21 человек, в этом году - 19. Все были обследованы, и только у семи обнаружились подозрения на "свиной грипп", - сказал Глава государства. Он подчеркнул, что в стране идет постоянный мониторинг ситуации и за последние сутки отмечается серьезный спад заболеваемости ОРВИ. Этому также способствовало установление морозной погоды. "Не надо поднимать гвалт. Не надо создавать искусственно ажиотаж", - подчеркнул Президент.

Александр Лукашенко считает, что немалую *роль в раздувании ажиотажа* вокруг этой ситуации создали и *фармацевтические компании*. "Неужели вы не понимаете, что происходит? Это опасная и коррумпированная сфера, - сказал он. - Я знаю, что происходит в этой суперкоррумпированной среде".

"Это не чума и не холера. Это излечимое заболевание, - отметил Президент. - Проблема где-то и в самих людях. Мы настаиваем, чтобы люди не занимались самолечением. Не надо создавать ажиотаж, но если заболел - обратись к специалистам, которые всех вылечат". Глава государства поблагодарил медиков за их работу в таких условиях. "Медики - это действительно герои, которым пришлось бороться не только с заболеванием, но и с тем ажиотажем, который вокруг всего этого создали", - сказал он.

КОМСОМОЛЬСКАЯ ПРАВДА RU

Андрей Рябцев

Александр Лукашенко: "Мы перестали кукарекать, а теперь завизжали по-свинячьи"

Комсомольская Правда, 6 ноября 2009, 17:32
https://www.kp.ru/daily/24389/568366/

Батька провел научно-популярную лекцию для украинских журналистов

Президент Белоруссии, как выясняется, весьма сведущ не только в вопросах политики и экономики. Лукашенко во время визита в Киев вывел на чистую воду тех, кто разводит истерию вокруг свиного гриппа. Недуг, как известно, бушует на Украине. В основном, в западных ее областях.

- Я знаю, что происходит в этой суперкоррумпированной среде, бандитской среде торговли и производства лекарствами, - с загадочным прищуром начал издалека Батька.

- Давайте говорить откровенно - давно мы перестали кукарекать по поводу «птичьего» гриппа. Кукарекал весь мир.

Журналисты удивленно переглядывались: кто именно из присутствовавших был замечен в кукарекании.

- Наверное, все уже продали, - продолжал разоблачать Батька, имея ввиду лекарства, которые в период эпидемии расхватывают как пирожки. - Что касается птичьего гриппа, теперь завизжали по-свинячьи. А завтра, наверное, замурлыкаем или замычим?

Ну, неужели вы не понимаете, что происходит? Этот грипп, пусть даже свинячий, - это не чума и холера, которые неизлечимы, он абсолютно излечим.

Лукашенко был возмущен тем, что вполне обычную болезнь он вынужден обсуждать на своем высоком президентском уровне.

- Человек серьезно заболел и начинает лечится малиной, вареньем лечится - когда уже поздно и до сорока температура, вместо того чтобы пройти в больницу, - объяснил Батька причину летальных исходов.

- Мы в состоянии сами справиться, и Украина справится. Не надо бояться, нагнетать ситуацию и обстановку, - утешил всех Лукашенко.

Русская линия

Александр Лукашенко: «Вы что, не понимаете, что происходит?»

Русская Линия, 11 ноября 2009
http://rusk.ru/newsdata.php?idar=185823

Президент Белоруссии призвал не поддаваться искусственному ажиотажу вокруг «свиного гриппа»…

Причина искусственного ажиотажа вокруг «свиного гриппа» лежит в коммерческой сфере, сказал президент Белоруссии Александр Лукашенко, комментируя истерию, охватившую Украину в связи с объявленной там в конце октября эпидемией гриппа, сообщает РИА «Новости».

«Давайте говорить откровенно, давно ли мы перестали "кукарекать" по поводу "птичьегоЭ гриппа? "Кукарекал" весь мир. Наверное, все (лекарства) уже продали. Сегодня завизжали по-свинячьи. А завтра, наверное, замурлыкаем или замычим. Вы что, не понимаете, что происходит?» – сказал Лукашенко на совместной с президентом Украины Виктором Ющенко пресс-конференции в Киеве.

По мнению белорусского лидера, «этот грипп, пусть даже свинячий, – это не чума и холера, он вполне излечим», а ажиотаж только мешает в борьбе с болезнью. «Медикам приходится бороться не только с самим заболеванием, но и с ажиотажем», – заявил А.Лукашенко.

В то же время, президент Белоруссии отметил, что этот ажиотаж выгоден производителям лекарств и торговцам. «Я знаю, что происходит в этой суперкоррумпированной, бандитской среде в производстве и торговле лекарствами», – подчеркнул он.

«Есть у нас марлевый завод, надо будут марлевые повязки – будем с Виктором Андреевичем вместе там штамповать и развозить. Только вы покупайте», – пошутил Лукашенко, добавив, что через неделю марлевые повязки украинцам уже не понадобятся. Лукашенко выразил уверенность в том, что и Белоруссия, и Украина вполне в состоянии справиться с проблемой «свиного гриппа». «Не надо бояться, нагнетать ситуацию и обстановку», – резюмировал белорусский лидер. // *Русская линия*

Свиной грипп – одна из крупнейших афер нашего времени?

AFN, 26 ноября 2009, 15:37
https://www.afn.by/news/i/128018

Пандемия свиного гриппа может оказаться самой грандиозной коррупционной аферой нашего времени. К такому выводу пришли журналисты датской газеты *Information*, изучившие связи экспертов Всемирной организации здравоохранения (ВОЗ) с ведущими мировыми фармацевтическими компаниями, обогатившимися на продаже препаратов против этой болезни. Выяснилось, например, что многие ученые, заседающие в различных комитетах ВОЗ, тщательно скрывают тот факт, что они получают деньги от фирм-гигантов мировой фармакологии, пишет газета "Новые известия".

Издание отмечает, что на фоне глобального экономического кризиса благодаря панике, охватившей мир в связи с пандемией свиного гриппа, фармацевтические заводы работают в четыре смены, мощностей не хватает.

Между тем на данный момент по официальной статистике, жертвами гриппа A/H1N1 стали 6 тыс. человек, в то время как средняя ежегодная смертность во время эпидемий "традиционных" разновидностей гриппа достигает полумиллиона.

Причина гипертрофированной реакции мира на не столь уж опасный свиной грипп, как считают опрошенные датской газетой специалисты, заключается в успешной пиар-кампании, проведенной экспертами ВОЗ. Некоторые из них в прямом смысле состоят на службе у производителей вакцины.

ВОЗ объявила свиной грипп пандемией под давлением группы советников этой организации во главе с голландским доктором Альбертом Остенхаусом. Сейчас правительство Нидерландов проводит экстренное расследование его деятельности, поскольку стало известно, что он получает зарплату в нескольких компаниях, производящих вакцину против свиного гриппа.

Многие другие советники ВОЗ, потребовавшие объявления свиного гриппа пандемией, также являются платными советниками фармацевтических гигантов Roche, RW Johnson, SmithKline и Beecham Glaxo Wellcome, получивших львиную долю заказов на изготовление вакцин. Итогом давления этих экспертов стала резолюция ВОЗ от 7 июля этого года, давшая старт невиданной кампании массовой вакцинации, отмечает газета.

Между тем спикер ВОЗ Грегори Хэртл, комментируя статью в Information, заметил, что невозможно отказаться от услуг ведущих мировых специалистов лишь на том основании, что они финансово заинтересованы в продвижении той или иной стратегии борьбы с различными заболеваниями.

В Беларуси "отменили" свиной грипп

Euro-Radio, 10 декабря 2009, 23:09
https://euroradio.fm/ru/v-belarusi-otmenili-svinoy-gripp-5

Белорусские медики прекратили учет случаев пандемического гриппа, сообщает "Интерфакс-Запад".

В Министерстве здравоохранения отметили, что необходимости в массовом обследовании населения и подсчете случаев "свиного" гриппа на данном этапе нет.

Там сослались на рекомендации Всемирной организации здравоохранения, согласно которым "при появлении значительного количества ОРВИ на фоне лабораторно доказанного проникновения в страну вируса пандемического гриппа индивидуальный учет не нужен".

Напомним, "свиной" грипп в Беларуси был подтвержден у 165 человек, из которых 139 – за последнее время. По состоянию на середину ноября в Беларуси от "свиного" гриппа умерли 13 человек.

Encephalophathies Following Prophylactic Pertussis Vaccine

Pediatrics, 1948, April, 1(4): 437-457
https://archive.org/details/pediatrics-1948/ https://doi.org/10.1542/peds.1.4.437

Introduction

Inflammatory reactions involving various parts of the nervous system following injections of various sera or vaccines *have long been known* but, so far as we are aware, no one has described the severe encephalopathies which have been observed following the prophylactic use of pertussis vaccine in infants.

Madsen[1] in his report on the prophylactic inoculations of 1,832 Faroe Islanders mentioned the death of two small infants in convulsions beginning one or two hours after injections of fluid pertussis vaccine. He reported that autopsies failed to disclose any adequate cause of death. Werne and Garrow[2] reported the death in shock of a pair of identical twins 16 and 24 hours respectively after the second injection of alum-precipitated diphtheria toxoid and pertussis antigen. Careful post mortem examination showed widespread vascular injury. Convulsions, said to be ephemeral in character, have been reported by a number of observers, Doull, Shibley, and McClelland[3] reported three children with convulsions among 496 children immunized with fluid vaccine. Taylor[4] reported a reaction to the vaccine of a ten-month-old boy characterized by subnormal temperature, limpness, and convulsions coming on a few hours after the injection. Recovery was stated to be complete in a few hours. Kendrick and Eldering[5] reported the immunization of 1,815 children, 6 to 15 months of age, by 9,075 injections, with one reaction characterized by convulsions. Sako[6] and his co-workers reported two instances of convulsions following 6,600 injections of H. pertussis alum-precipitated vaccine, and in a personal communication Sako states that in approximately 105,000 children immunized to pertussis, there have been four transient convulsions. Many large series, such as the early ones of Sauer[7] involving 3,974 children and the later one of Cravitz and Cauley[8] including 5,000 chil-dren, have been reported without reference to such accidents.

...

Summary

Inspection of the records of the Children's Hospital for the past ten years has disclosed 15 instances in which children developed acute cerebral symptoms within a period of hours after the administration of pertussis vaccine. The children varied between 5 and 18 months in age and, in so far as it is possible to judge children of this age range, were developing normally according to histories supplied by their parents. None had had convulsions previously. Many different lots of vaccine, made by eight different manufacturers over a period of eight years, were implicated. The inoculations were given throughout the usual geographic range of children coming to this hospital. All but one, at the time of follow-up or death, showed evidence of impairment of the nervous system, which might still have been in the healing stage in three or four.

During the same period about half as many children were seen in the hospital suffering from the encephalopathy secondary to smallpox vaccination, and about twice as many from the encephalopathy complicating pertussis itself.

A variety of etiologic considerations were suggested by consideration of the reported cases and references to the literature. That constitutional factors may have been involved was suggested by both the preponderance of males as opposed to females, and by the high incidence of abnormalities of the nervous system in the family histories. The clinical course and cytologic abnormalities of spinal fluids found in acute cases indicated an encephalopathy. The literature suggested that this process might have resulted from either the activity of a specific toxin or from an antigen-antibody response. Against the former of these hypotheses was the unstable nature of the heretofore recognized toxins which could hardly survive in properly aged vaccines. The rapid onset of symptoms, occasionally within minutes of the first injection, seemed strong evidence against the second. The present study has left these etiologic considerations unanswered, but it has called attention to a risk of the prophylactic use of pertussis vaccine not hitherto recognized.

In view of the impressive evidence of the effectiveness of prophylactic pertussis vaccine now accumulating, it seems likely that babies are safer vaccinated than not. Further studies should be made to prove this point definitely, for the encephalopathy following pertussis vaccine seems more devastating than the vast majority of the nervous lesions following the use of smallpox vaccine.

Conclusion

In common with many other biologic materials used parenterally, an important risk of encephalopathy attends the use of prophylactic pertussis vaccine. The mechanism whereby the encephalopathy is produced is not elucidated by the present study. The universal use of such vaccine is warranted only if it can be shown to be effective in preventing encephalopathy or death from pertussis itself in large groups of children. If avoidance of the inconvenience of the average attack of pertussis is all that is expected, the risk seems considerable. Efforts to diminish the hazard by modification of the vaccine or new methods of administration seem indicated.

This progressive and ultimately fatal disease of children and adolescents had been suspected to be of viral origin since its initial description by Dawson in 1932. Measles virus or a virus very closely related to measles virus has been recovered from the brains of patients with the disease. The disorder may be considered to be a slow form of measles encephalitis (see Chap. 200).

giform virus encephalopathies. Although these diseases have been shown to be of infectious etiology by the transmission of neurological illness to higher primates, their causative agents remain incompletely characterized. They are classified as the slow virus infections due to unconventional agents.

SUBACUTE SCLEROSING PANENCEPHALITIS (INCLUSION-BODY ENCEPHALITIS) This progressive and ultimately fatal disease of children and adolescents had been suspected to be of viral origin since its initial description by Dawson in 1932. Measles virus or a virus very closely related to measles virus has been recovered from the brains of patients with the disease. The disorder may be considered to be a slow form of measles encephalitis (see Chap. 200).

SSPE occurs in patients between the ages of 4 and 20; 80 percent are under 11. The disease affects boys 3 to 10 times as frequently as girls. The incidence has fallen recently. Most patients are from rural areas or small towns. Characteristically, they are entirely well until the disease begins. The onset of usually insidious mental deterioration, often expressed by a decline in the patient's schoolwork, is the presenting symptom. Incoordination, ataxia, and myoclonic jerks develop within a few months along with abnormalities of the pyramidal and extrapyramidal motor systems. Cortical blindness, papilledema, and optic atrophy may be present; focal chorioretinitis has been described. A few cases have occurred in association with infectious mononucleosis.

The patient becomes bedridden within 6 to 9 months. Death results from superimposed pulmonary or urinary tract infections or from decubiti. Signs of meningeal irritation are absent.

The CSF gamma-globulin level, as determined by electrophoresis, quantitative immunochemical assay, or colloidal gold curve, is elevated, but the fluid is otherwise normal. The EEG typically shows a "burst suppression" pattern characterized by synchronous and symmetrical spike and high-voltage slow wave activity followed by electrical inactivity. Elevated levels of measles antibody are found in the serum and CSF.

Pathologic findings include lymphocyte and mononuclear infiltrations about small cerebral arteries and veins, intranuclear and intracytoplasmic inclusions in neurons and glial cells, and varying degrees of destruction of medullated nerve fibers. The lesions occur in the cerebral gray and white matter, brainstem and cerebellum.

Measles virus is the etiologic agent. Electron-microscopic studies show that the intranuclear inclusions in brain cells are composed of hollow tubular filaments resembling the internal nucleocapsid component of a paramyxovirus. Staining of brain tissue from patients with the disease demonstrates measles virus antigen in the inclusions. An agent serologically identical with measles virus and having the properties of measles virus has been recovered from brain by cocultivating cell cultures originating from brain tissue with established laboratory cell lines.

Attempts to transmit the disease to animals have met with variable results. Ferrets inoculated with suspensions of brain from patients with the disease develop a nonfatal neurological disorder with EEG changes.

There is evidence that SSPE patients have clinical measles at an unusually early age, but SSPE appears many years after the patient's initial rubeola infection. A few reported cases may have been related to measles vaccination. The risk of SSPE following measles vaccination is far less, however, than the risk of encephalitis or SSPE following natural measles.

SSPE patients lack antibody to one of the measles virus proteins (the M or matrix protein) despite high titers of antibodies to the other viral proteins. The M protein is a nonglycosylated protein localized to the inner surface of the viral membrane; it is important in the assembly of the virus particle at the cell surface. SSPE brain cells do not appear capable of synthesizing the M protein even in normal amounts. The reason for this selective defect in a single viral protein has not been ascertained.

Isoprinosine[1] has been reported by some to affect the course of the disease favorably in an open therapeutic trial, but there is controversy about the drug's effectiveness.

PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY This rare neurological condition, first described in 1958, usually occurs in patients who have leukemia, malignant lymphoma, carcinomatosis, immunosuppressive therapy, or a variety of other chronic disease processes. The disease is consistently associated with disorders of cell-mediated immunity with which deficits in humoral antibody response may or may not coexist.

The disease affects adults of both sexes, and its duration from onset of symptoms to death is 1 to 6 or more months. The neurological signs and symptoms reflect a diffuse, asymmetric involvement of the cerebral hemispheres. Hemiplegia, hemianopsia, aphasia or dysarthria, and organic mental changes are frequent; visual field abnormalities and complete or incomplete transverse myelitis may develop. Headache and convulsive seizures are rare, but EEG abnormalities consisting of diffuse or focal abnormalities are often present. Lesions in the white matter may be recognized on CT scans. CSF is normal.

The pathologic changes consist of multiple areas of demyelination with little or no perivascular infiltration and abnormal mitotic figures in astrocytes. The presence of distinctive intranuclear inclusions in oligodendrocytes first suggested that the disease was of a viral etiology. Electron-microscopic observations show the intranuclear inclusion bodies to be composed of closely packed spheres, which have the physical dimensions and properties of the polyomavirus genus of the papovaviruses.

By employing tissue cultures derived from human fetal brain it has been possible to recover a new human polyomavirus serotype (JC virus) from the brains of PML patients. Abundant virus particles are present in brain. Rapid identification of the virus in brain is possible using fluorescent antibody staining or electron-microscopic agglutination with monospecific hyperimmune rabbit serum. Serologic diagnosis using the patient's serum is unreliable. The virus has not been demonstrated in tissues other than brain; the disease has not been transmitted to animals.

There are isolated reports of clinical remission with cytosine arabinoside, but no cures. Death usually occurs within 6 months of onset.

PML may result from the activation of a polyomavirus which has been latent in brain or other tissues since childhood infection. Alternatively, there may be certain individuals who fail to acquire immunity in childhood and have their first encounter with the virus when a disease which interferes with cell-mediated immunity develops. The demyelination which

Москва «Медицина» 1997, с. 177-178

Подострый склерозирующий панэнцефалит (ПСПС)
Это прогрессирующее, с неизбежным фатальным исходом заболеваний - детеей и подростков называют «энцефалитом с внутриклеточными включениями». Из мозга больных выделяют вирус кори или кореподобный вирус. Заболевание можно рассматривать как медленную форму коревого энцефалита (см. гл. 132).

Болеют дети (мальчики в 3-10 раз чаще, чем девочки) в возрасте от 4 до 20 лет, 80% больных моложе 11 лет. Средние ежегодные показатели заболеваемости быстро снижались за два последних десятилетия, что происходило почти параллельно со снижением числа случаев кори, диагностированных со времени начала практического применения живой аттенуированной вакцины. Большинство пациентов – жители сельской местности или небольших городов. Характерно то, что до развития заболевания они были практически здоровыми детьми. У больных постепенно нарастают нарушения интеллекта, снижается успеваемость в школе. В течение нескольких месяцев появляются расстройства координации, атаксия, миоклонические признаки вовлечения в патологический процесс пирамидной и экстрапирамидной систем. Могут наблюдаться корковая слепота, отек дисков зрительных нервов, атрофия зрительных нервов, очаговый хориоретинит. Имеются описания нескольких случаев сочетания заболевания с инфекционным мононуклеозом.

Через б-9 мес больной становится прикованным к постели. Смерть наступает в связи с интеркуррентными инфекциями легких или мочевыводящей системы, пролежнями. Менингеальные знаки отсутствуют. Дифференциальный диагноз проводят с церебральными болезнями накопления и не относящимися к числу последних полиодист рофиями, лейкодистрофиями и демиеяинизирующими заболеваниями детей.

Уровень гамма-глобулинов в СМЖ, определяемый с помощью электрофореза, количественного иммунохимического исследования или пробы с коллоидным золотом, повышен, но все остальные характеристики в СМЖ нормальные. При ЭЭГ выявляют признак «угнетения вспышек активности», характеризующийся синхронными и симметричными спайками и высокоамплитудной медленноволновой активностью, которые сменяются исчезновением электрической активности. Титры противокоревых антител в сыворотке крови и СМЖ повышены. Изменения при КТ коррелируют со стадией и длительностью течения заболевания. Это дилатация бокового желудочка, кортикальная атрофия, низкое ослабление рентгеновских лучей паренхимой мозга, атрофия ствола и мозжечка.

К числу патологоанатомических изменений относятся лимфоцитарная и мононуклеарная инфильтрация вблизи мелких церебральных артерий и вен, внутриядерные и внутрицитоплазматические включения в нейронах и глиальных клетках, а также различной степени выраженности деструкция миелинизированных нервных волокон. Очаги поражения локализуются в сером и белом веществе полушарий мозга, стволе и мозжечке.

Этиологическим фактором является вирус кори. Как показали электронно-микроскопические исследования, внутриядерные включения в клетках мозга состоят из полых тубулярных фрагментов, сходных с компонентом внутреннего нуклеокапсида парамиксовирусов.

При окрашивании ткани мозга больных во внутриклеточных включениях выявляют антиген вируса кори. Возбудитель, серологически идентичный вирусу кори и обладающий свойствами вируса кори, был выделен из мозга при кокультивировании клеточного материала или мозговой ткани со стандартными лабораторными клеточными линиями.

Попытки заражения животных дали неоднозначные результаты. У хорьков, которым были инокулированы суспензии мозга больных с ПСПЭ, развились нефатальные неврологические нарушения, которым сопутствовали изменения при ЭЭГ.

Имеются сведения о том, что больные с ПСПЭ в необычно раннем возрасте переносят инфекцию с клиническими признаками кори, но ПСПЭ развивается у них через много лет после этого. *Несколько описанных случаев, возможно, были связаны с коревой вакцинацией*. Между тем риск развития ПСПЭ после коревой вакцинации значительно ниже, чем риск возникновения энцефалита или ПСПЭ после обычного заболевания корью.

У пациентов с ПСПЭ отсутствуют антитела к одному из коревых вирусных белков (протеин М, или матриксный протеин), тогда как титры антител к другим вирусным белкам достаточно высокие. В экстрактах мозга отсутствуют значительные количества М-антигена. Протеин М представляет собой негликолизированный белок, локализующийся на внутренней поверхности вирусной мембраны; ему принадлежит важная роль в агрегации вирусных частиц на клеточной поверхности. При ПСПЭ клетки мозга, по-видимому, неспособны к синтезу протеина М даже в нормальных количествах. Молекулярные механизмы отсутствия полипептида М в терминальной стадии ПСПЭ могут быть связаны со сниженной транскрипцией и трансляцией М-информационной РНК.

Имеются данные о некотором положительном действии на течение болезни изопринозина (Isoprlnoslne) (к моменту выхода книги в свет этот препарат еще не был одобрен Управлением по контролю за качеством пищевых продуктов и лекарственных средств), апробированного в открытом клиническом исследовании, но мнения об эффективности данного препарата противоречивы. Другие способы лечения (включая применение интерферона и плазмафереза) оказались неэффективными.

Summary

Background We investigated a consecutive series of children with chronic enterocolitis and regressive developmental disorder.

Methods 12 children (mean age 6 years [range 3–10], 11 boys) were referred to a paediatric gastroenterology unit with a history of normal development followed by loss of acquired skills, including language, together with diarrhoea and abdominal pain. Children underwent gastroenterological, neurological, and developmental assessment and review of developmental records. Ileocolonoscopy and biopsy sampling, magnetic-resonance imaging (MRI), electroencephalography (EEG), and lumbar puncture were done under sedation. Barium follow-through radiography was done where possible. Biochemical, haematological, and immunological profiles were examined.

Findings Onset of behavioural symptoms was associated, by the parents, with measles, mumps, and rubella vaccination in eight of the 12 children, with measles infection in one child, and otitis media in another. All 12 children had intestinal abnormalities, ranging from lymphoid nodular hyperplasia to aphthoid ulceration. Histology showed patchy chronic inflammation in the colon in 11 children and reactive ileal lymphoid hyperplasia in seven, but no granulomas. Behavioural disorders included autism (nine), disintegrative psychosis (one), and possible postviral or vaccinal encephalitis (two). There were no focal neurological abnormalities and MRI and EEG tests were normal. Abnormal laboratory results were significantly raised urinary methylmalonic acid compared with age-matched controls (p=0·003), low haemoglobin in four children, and a low serum IgA in four children.

Interpretation We identified associated gastrointestinal disease and developmental regression in a group of previously normal children, which was generally associated in time with possible environmental triggers.

Introduction

We saw several children who, after a period of apparent normality, lost acquired skills, including communication. They all had gastrointestinal symptoms, including abdominal pain, diarrhoea, and bloating and, in some cases, food intolerance. We describe the clinical findings, and gastrointestinal features of these children.

Patients and methods

12 children, consecutively referred to the department of paediatric gastroenterology with a history of a pervasive developmental disorder with loss of acquired skills and intestinal symptoms (diarrhoea, abdominal pain, bloating and food intolerance), were investigated. All children were admitted to the ward for 1 week, accompanied by their parents.

Clinical investigations

We took histories, including details of immunisations and exposure to infectious diseases, and assessed the children. In 11 cases the history was obtained by the senior clinician (JW-S). Neurological and psychiatric assessments were done by consultant staff (PH, MB) with HMS-4 criteria.[1] Developmental histories included a review of prospective developmental records from parents, health visitors, and general practitioners. Four children did not undergo psychiatric assessment in hospital; all had been assessed professionally elsewhere, so these assessments were used as the basis for their behavioural diagnosis.

After bowel preparation, ileocolonoscopy was performed by SHM or MAT under sedation with midazolam and pethidine. Paired frozen and formalin-fixed mucosal biopsy samples were taken from the terminal ileum; ascending, transverse, descending, and sigmoid colons, and from the rectum. The procedure was recorded by video or still images, and were compared with images of the previous seven consecutive paediatric colonoscopies (four normal colonoscopies and three on children with ulcerative colitis), in which the physician reported normal appearances in the terminal ileum. Barium follow-through radiography was possible in some cases.

Also under sedation, cerebral magnetic-resonance imaging (MRI), electroencephalography (EEG) including visual, brain stem auditory, and sensory evoked potentials (where compliance made these possible), and lumbar puncture were done.

Laboratory investigations

Thyroid function, serum long-chain fatty acids, and cerebrospinal-fluid lactate were measured to exclude known causes of childhood neurodegenerative disease. Urinary methylmalonic acid was measured in random urine samples from eight of the 12 children and 14 age-matched and sex-matched normal controls, by a modification of a technique described previously.[2] Chromatograms were scanned digitally on computer, to analyse the methylmalonic-acid zones from cases and controls. Urinary methylmalonic-acid concentrations in patients and controls were compared by a two-sample *t* test. Urinary creatinine was estimated by routine spectrophotometric assay.

Children were screened for antiendomyseal antibodies and boys were screened for fragile-X if this had not been done

Ileal-lymphoid-nodular hyperplasia, non-specific colitis, and pervasive developmental disorder in children.

Lancet, 28 February 1998; 351(9103):637-41
doi: 10.1016/s0140-6736(97)11096-0.

Summary

Background: We investigated a consecutive series of children with chronic enterocolitis and regressive developmental disorder.

Methods: 12 children (mean age 6 years [range 3–10], 11 boys) were referred to a paediatric gastroenterology unit with a history of normal development followed by loss of acquired skills, including language, together with diarrhoea and abdominal pain. Children underwent gastroenterological, neurological, and developmental assessment and review of developmental records. Ileocolonoscopy and biopsy sampling, magnetic-resonance imaging (MRI), electroencephalography (EEG), and lumbar puncture were done under sedation. Barium follow-through radiography was done where possible. Biochemical, haematological, and immunological profiles were examined.

Findings: Onset of behavioural symptoms was associated, by the parents, with measles, mumps, and rubella vaccination in eight of the 12 children, with measles infection in one child, and otitis media in another. All 12 children had intestinal abnormalities, ranging from lymphoid nodular hyperplasia to aphthoid ulceration. Histology showed patchy chronic inflammation in the colon in 11 children and reactive ileal lymphoid hyperplasia in seven, but no granulomas. Behavioural disorders autism (nine), disintegrative psychosis (one), and possible postviral or vaccinal encephalitis (two). There were no focal neurological abnormalities and MRI and EEG tests were normal. Abnormal laboratory results were significantly raised urinary methylmalonic acid compared with agematched controls (p=0-003), low haemoglobin in four children, and a low serum IgA in four chrldren.

Interpretation: We identified associated gastrointestinal disease and developmental regression in a group of previously normal children, which was generally associated in time with possible enviramental triggers.

...

Discussion

We describe a pattern of colitis and ileal-lymphoid-nodular hyperplasia in children with developmental disorders. Intestinal and behavioural pathologies may have occurred together by chance, reflecting a selection bias in a self-referred group; however, the uniformity of the intestinal pathological changes and the fact that previous studies have found intestinal dysfunction in children with autistic-spectrum disorders, suggests that the connection is real and reflects a unique disease process.

Asperger first recorded the link between coeliac disease and behavioural psychoses.[4] Walker-Smith and colleagues[5] detected low concentrations of alpha-1 antitrypsin in children with typical autism, and D'Eufemia and colleagues6 identified abnormal intestinal permeability, a feature of small intestinal enteropathy, in 43% of a group of autistic children with no gastrointestinal symptoms, but not in matched controls. These studies, together with our own, including evidence of anaemia and IgA deficiency in some children, would support the hypothesis that the consequences of an inflamed or dysfunctional intestine may play a part in behavioural changes in some children. ...

We did not prove an association between measles, mumps, and rubella vaccine and the syndrome described. Virological studies are underway that may help to resolve this issue.

If there is a causal link between measles, mumps, and rubella vaccine and this syndrome, a rising incidence might be anticipated after the introduction of this vaccine in the UK in 1988. Published evidence is inadequate to show whether there is a change in incidence 22 or a link with measles, mumps, and rubella vaccine.23 A genetic predisposition to autistic-spectrum disorders is suggested by over-representation in boys and a greater concordance rate in monozygotic than in dizygotic twins.15 In the context of susceptibility to infection, a genetic association with autism, linked to a null allele of the complement (C) 4B gene located in the class III region of the major-histocompatibility complex, has been recorded by Warren and colleagues.24 C4B-gene products are crucial for the activation of the complement pathway and protection against infection: individuals inheriting one or two C4B null alleles may not handle certain viruses appropriately, possibly including attenuated strains.

...

We have identified a chronic enterocolitis in children that may be related to neuropsychiatric dysfunction. *In most cases, onset of symptoms was after measles, mumps, and rubella immunisation*. Further investigations are needed to examine this syndrome and its possible relation to this vaccine.

Introduction

We saw several children who, after a period of apparent normality, lost acquired skills, including communication. They all had gastrointestinal symptoms, including abdominal pain, diarrhoea, and bloating and, in some cases, food intolerance. We describe the clinical findings, and gastrointestinal features of these children.

Patients and methods

12 children, consecutively referred to the department of paediatric gastroenterology with a history of a pervasive developmental disorder with loss of acquired skills and intestinal symptoms (diarrhoea, abdominal pain, bloating and food intolerance), were investigated. All children were admitted to the ward for 1 week, accompanied by their parents.

Clinical investigations

We took histories including details of immunisations and exposure to infectious diseases, and assessed the children. In 11 cases the history was obtained by the senior clinician (JW-S). Neurological and psychiatric assessments were done by consultant staff (PH, MB) with HMS-4 criteria.[1] Developmental assessments included a review of prospective developmental records from parents, health visitors, and general practitioners. Four children did not undergo psychiatric assessment in hospital; all had been assessed professionally elsewhere, so these assessments were used as the basis for their behavioural diagnosis.

After bowel preparation, ileocolonoscopy was performed by SHM or MAT under sedation with midazolam and pethidine. Paired frozen and formalin-fixed mucosal biopsy samples were taken from the terminal ileum; ascending, transverse, descending, and sigmoid colons, and from the rectum. The procedure was recorded by video or still images, and were compared with images of the previous seven consecutive paediatric colonoscopies (four normal colonoscopies and three on children with ulcerative colitis), in which the physician reported normal appearances in the terminal ileum. Barium follow-through radiography was possible in some cases.

Also under sedation, cerebral magnetic-resonance imaging (MRI), electroencephalography (EEG) including visual, brain stem auditory, and sensory evoked potentials (where compliance made these possible), and lumbar puncture were done.

Laboratory investigations

Thyroid function, serum long-chain fatty acids, and cerebrospinal-fluid lactate were measured to exclude known causes of childhood neurodegenerative disease. Urinary methylmalonic acid was measured in random urine samples from eight of the 12 children and 14 age-matched and sex-matched normal controls, by a modification of a technique described previously.[2] Chromatograms were scanned digitally on computer, to analyse the methylmalonic-acid zones from cases and controls. Urinary methylmalonic-acid concentrations in patients and controls were compared by a two-sample *t* test. Urinary creatinine was estimated by routine spectrophotometric assay.

before. Stool samples were cultured for *Campylobacter* spp, *Salmonella* spp, and *Shigella* spp and assessed by microscopy for ova and parasites. Sera were screened for antibodies to *Yersinia enterocolitica*.

Histology

Formalin-fixed biopsy samples of ileum and colon were assessed and reported by a pathologist (SED). Five ileocolonic biopsy series from age-matched and site-matched controls with reports showed histologically normal mucosa were obtained for comparison. All tissues were assessed by three other clinical and experimental pathologists (APD, AA, AJW).

Ethical approval and consent

Investigations were approved by the Ethical Practices Committee of the Royal Free Hospital NHS Trust, and parents gave informed consent.

Results

Clinical details of the children are shown in tables 1 and 2. None had neurological abnormalities on clinical examination; MRI scans, EEGs, and cerebrospinal-fluid profiles were normal; and fragile X was negative. Prospective developmental records showed satisfactory achievement of early milestones in all children. The only girl (child number eight) was noted to be a slow developer compared with her older sister. She was subsequently found to have coarctation of the aorta. After surgical repair of the aorta at the age of 14 months, she progressed rapidly, and learnt to talk. Speech was lost later. Child four was kept under review for the first year of life because of wide bridging of the nose. He was discharged from follow-up as developmentally normal at age 1 year.

In eight children, the onset of behavioural problems had been linked, either by the parents or by the child's physician, with measles, mumps, and rubella vaccination. Five had had an early adverse reaction to immunisation (rash, fever, delirium; and, in three cases, convulsions). In these eight children the average interval from exposure to first behavioural symptoms was 6·3 days (range 1–14). Parents were less clear about the timing of onset of abdominal symptoms because children were not toilet trained at the time or because behavioural features made children unable to communicate symptoms.

One child (child number four) had received monovalent measles vaccine at 15 months, after which his development slowed (confirmed by professional assessors). No association was made with the vaccine at the time. He received a dose of measles, mumps, and rubella vaccine at age 4·5 years, the day after which his mother described a striking deterioration in his behaviour which she did link with the immunisation. Child nine received measles, mumps, and rubella vaccine at 16 months. At 18 months he developed recurrent antibiotic-resistant otitis media and the first behavioural symptoms, including disinterest in his sibling and lack of play.

Table 2 summarises the neuropsychiatric diagnoses; the apparent precipitating events; onset of behavioural features; and age of onset of both behaviour and bowel symptoms.

Laboratory tests

All children were antiendomyseal-antibody negative and common enteric pathogens were not identified by culture, microscopy, or serology. Urinary methylmalonic-acid excretion was significantly raised in all eight children who

Table 2: **Neuropsychiatric diagnosis**

were tested, compared with age-matched controls (p=0·003; figure 1). Abnormal laboratory tests are shown in table 1.

Endoscopic findings

The caecum was seen in all cases, and the ileum in all but two cases. Endoscopic findings are shown in table 1. Macroscopic colonic appearances were reported as normal in four children. The remaining eight had col and rectal mucosal abnormalities including granular loss of vascular pattern, patchy erythema, lympho nodular hyperplasia, and in two cas phthoi ulceration. Four cases showed the "red h" sig round swollen caecal lymphoid follicles, ar early en scopic feature of Crohn's disease.[3] The st consistent feature was lymphoid odula perplasia of the terminal ileum which w seen in e children (figure 2), and identified by ar follow-thro h in one other child in whom th ileum was not reached at endoscopy. The nor endoscopic ppearance of the terminal ileum (fig 2) was seen in t seven children whose images we available for comparison.

Histological findi

Histolo dings summ ised in table 1.

Ter al ileum A reactiv mphoid follicular hyperplasia wa resent i ileal biopsies of seven children. In each case, r han three expanded and confluent lymphoid follicles th reactive germinal centres were identified within the issue section (figure 3). There was no neutrophil in rate and granulomas were not present.

Colon The lamina propria was infiltrated by mononuclear cells (mainly lymphocytes and macrophages) in the colonic-biopsy samples. The extent ranged in severity from scattered focal collections of cells beneath the surface epithelium (five cases) to diffuse infiltration of the mucosa (six cases). There was no increase in intraepithelial lymphocytes, except in one case, in which numerous lymphocytes had infiltrated the surface epithelium in the proximal colonic biopsies. Lymphoid follicles in the vicinity of mononuclear-cell infiltrates showed en ge erminal cen with reactive changes that included an ex s of tingible body macrophages.

There was no clear relation between the endoscopic ap arances and the istological findings; chronic i ammatory changes were apparent histologically in doscopically rmal areas of the colon. In five cases t e was focal ute inflammation with infiltration of the lam propri by neutrophils; in three of these, neutro filtrated the caecal (figure 3) and rectal- pt epithelium. There were no crypt abscesses. Occ al bifid crypts were noted but overall crypt architecture was normal. There was no goblet-cell depletion but occasional collections of eosinophils were seen in the mucosa. There were no granulomata. Parasites and organisms were not seen. None of the changes described above were seen in any of the normal biopsy specimens.

Discussion

We describe a pattern of colitis and ileal-lymphoid-nodular hyperplasia in children with developmental disorders. Intestinal and behavioural pathologies may have occurred together by chance, reflecting a selection bias in a self-referred group; however, the uniformity of the intestinal pathological changes and the fact that previous studies have found intestinal dysfunction in children with autistic-spectrum disorders, suggests that the connection is real and reflects a unique disease process.

Asperger first recorded the link between coeliac disease and behavioural psychoses.[4] Walker-Smith and colleagues[5] detected low concentrations of alpha-1 antitrypsin in children with typical autism, and D'Eufemia and colleagues[6] identified abnormal intestinal permeability, a feature of small intestinal enteropathy, in 43% of a group of autistic children with no gastrointestinal symptoms, but not in matched controls. These studies, together with our own, including evidence of anaemia and IgA deficiency in some children, would support the hypothesis that the consequences of an inflamed or dysfunctional intestine may play a part in behavioural changes in some children.

…e aspec… f impaired intestinal function that could perm… inc…ased pe…eability to exogenous peptides is deficien… of the phenyl-sulphur-transferase systems, as described … by Waring.[10] The normally sulphated glycoprotein … atrix of the gut wall acts to regulate cell and molecular trafficking.[11] Disruption of this matrix and increased intestinal permeability, both features of inflammatory bowel disease,[17] may cause both intestinal and neuropsychiatric dysfunction. Impaired enterohepatic sulphation and consequent detoxification of compounds such as the phenolic amines (dopamine, tyramine, and serotonin)[12] may also contribute. Both the presence of intestinal inflammation and absence of detectable neurological abnormality in our children are consistent with an exogenous influence upon cerebral function. Lucarelli's observation that after removal of a provocative enteric antigen children achieved symptomatic behavioural improvement, suggests a reversible element in this condition.[13]

Despite consistent gastrointestinal findings, behavioural changes in these children were more heterogeneous. In some cases the onset and course of behavioural regression was precipitous, with children losing all communication skills over a few weeks to months. This regression is consistent with a disintegrative psychosis (Heller's disease), which typically occurs when normally developing children show striking behaviour changes and developmental regression, commonly in association with some loss of coordination and bowel or bladder function.[14] Disintegrative psychosis is typically described as occurring in children after at least 2–3 years of apparently normal development.

Disintegrative psychosis is recognised as a sequel to measles encephalitis, although in most cases no cause is ever identified.[14] Viral encephalitis can give rise to autistic disorders, particularly when it occurs early in life.[15] Rubella virus is associated with autism and the combined measles, mumps, and rubella vaccine (rather than monovalent measles vaccine) has also been implicated. Fudenberg[16] noted that for 15 of 20 autistic children, the first symptoms developed within a week of vaccination. Gupta[17] commented on the striking association between measles, mumps, and rubella vaccination and the onset of behavioural symptoms in all the children that he had investigated for regressive autism. Measles virus[18,19] and measles vaccination[20] have both been implicated as risk

factors for Crohn's disease and persistent measles vaccine-strain virus infection has been found in children with autoimmune hepatitis.[21]

We did not prove an association between measles, mumps, and rubella vaccine and the syndrome described. Virological studies are underway that may help to resolve this issue.

If there is a causal link between measles, mumps, and rubella vaccine and this syndrome, a rising incidence might be anticipated after the introduction of this vaccine in the UK in 1988. Published evidence is inadequate to show whether there is a change in incidence[22] or a link with measles, mumps, and rubella vaccine.[23] A genetic predisposition to autistic-spectrum disorders is suggested by over-representation in boys and a greater concordance rate in monozygotic than in dizygotic twins.[15] In the context of susceptibility to infection, a genetic association with autism, linked to a null allele of the *complement (C) 4B* gene located in the class III region of the major-histocompatibility complex, has been recorded by Warren and colleagues.[24] *C4B*-gene products are crucial for the activation of the complement pathway and protection against infection: individuals inheriting one or two *C4B* null alleles may not handle certain viruses appropriately, possibly including attenuated strains.

Urinary methylmalonic-acid concentrations were raised in most of the children, a finding indicative of a functional vitamin B12 deficiency. Although vitamin B12 concentrations were normal, serum B12 is not a good measure of functional B12 status.[25] Urinary methylmalonic-acid excretion is increased in disorders such as Crohn's disease, in which cobalamin excreted in bile is not reabsorbed. A similar problem may have occurred in the children in our study. Vitamin B12 is essential for myelinogenesis in the developing central nervous system, a process that is not complete until around the age of 10 years. B12 deficiency may, therefore, be a contributory factor in the developmental regression.[26]

We have identified a chronic enterocolitis in children that may be related to neuropsychiatric dysfunction. In most cases, onset of symptoms was after measles, mumps, and rubella immunisation. Further investigations are needed to examine this syndrome and its possible relation to this vaccine.

Addendum:
Up to Jan 28, a further 40 patients have been assessed; 39 with the syndrome.

Contributors
A J Wakefield was the senior scientific investigator. S H Murch and M A Thomson did histopathological examinations. A Anthony, A P Dhillon, and S E Davies carried out the histopathology. J Linnell did the B12 studies. D M Casson and M Malik did the clinical assessment. M Berelowitz did the psychiatric assessment. P Harvey did the neurological assessment. Ileal-lymphoid-nodular hyperplasia, non-specific colitis, and pervasive developmental disorder in children

Lancet. 18 July 1998; 352(9123):234-235
doi: 10.1016/S0140-6736(05)77837-5.

[*Correspondence*]

Sir – A J Wakefield and co-workers[1] have identified a new relation *between gastrointestinal disease and developmental disorders* in children; it opens a new avenue for the study of the gastrointestinal tract and other diseases that may be immunologically mediated.

Their findings of ileal-lymphoid-nodular hyperplasia and non-specific colitis gastrointestinal manifestations in connection with autistic-spectrum disorders is the *first description of this relation*, with strong data suggesting the anatomical and histological alteration of the gut in such disorders.

Although these workers suggest possible mechanism(s) of increased permeability for exogenous molecules they do not offer any explanation for these gastrointestinal alterations. The endoscopic and histopathological findings of ileal-lymphoid-nodular hyperplasia and non-specific colitis have so far escaped explanation and have evaded pathogenetic definition.

In support of the findings of Wakefield et al are several behavioural and clinical features known to be related to the central nervous system (CNS), such as migraine,[2] infantile colic,[3] abdominal epilepsy,[4] allergic-tension-fatigue syndrome, and attention-deficit-hyperactivity disorder,[5] which have been related to food allergy, although the precise relation is still unclear. IgE-mediated food allergy is plainly not the only mechanism of tissue injury, and these specific disorders could involve other mechanisms.

A major investigative effort of our laboratories has been directed to the study of food allergy and the immunological involvement of the gut as a central focus for injury of other target organs (skin, lungs, and gastrointestinal tract). We have noted a striking appearance of ileal-lymphoid-nodular hyperplasia in patients with non-IgE-mediated food allergy who present with asthma, atopic dermatitis, and attention-deficit-hyperactivity disorder. We have also studied two patients with this hyperactive disorder who were allergic to various foods, and our findings obtained by colonoscopy of their terminal ileum, shown in the figure, match with those reported by Wakefield and co-workers.

In our study, ileal-lymphoid-nodular hyperplasia is the hallmark lesion of the gastrointestinal tract, which allows entry of antigens across the inflamed mucosa of the bowel as a result of the reactive inflammatory response in the adjacent lymphoid tissue of Peyer's patches in patients with non-IgE-mediated food allergy. We propose that similar mechanism(s) may be involved in the pathogenesis of the CNS dysfunction in the patients described by Wakefield and co-workers.[1]

Although Wakefield's study, which suggests a connection between the CNS and the gut in patients previously immunised with measles, mumps, and rubella vaccine, did not prove an association, it has stimulated further discussion and opened unanticipated lines of investigation concerning the role of ileal-lymphoid-nodular hyperplasia as a predictive marker of gastrointestinal inflammation responsible for immunologically mediated tissue injury in other target organs sites.

Revealed: MMR research scandal

The Times, 22 February 2004, 12.00 am GMT,
https://www.thetimes.com/article/revealed-mmr-research-scandal-7ncfntn8mjq

Full details are disclosed today of the four-month Sunday Times investigation that has uncovered a medical scandal at the heart of the worldwide scare over MMR.

Andrew Wakefield, the doctor who champions the alleged link between measles, mumps and rubella vaccine and autism in young children, stands discredited for misleading his medical colleagues and The Lancet, the professional journal that published his findings.

The investigation has found that when he warned parents to avoid MMR, and published research claiming a link with autism, he did not disclose he was being funded through solicitors seeking evidence to use against vaccine manufacturers.

The Lancet said yesterday that The Sunday Times's evidence meant that the finding linking MMR and autism was "entirely flawed" and should never have been published. Last night, John Reid, the health secretary, called for an inquiry by the General Medical Council (GMC) "as a matter of urgency".

Evan Harris, a Liberal Democrat MP who sits on the British Medical Association's ethics committee, said the GMC had inadequate powers and pressed the government for a full independent inquiry.After reviewing The Sunday Times's findings, Richard Horton, the editor of The Lancet, said he should never have published Wakefield's article linking MMR to autism. It was "fatally" flawed.

Wakefield was not contactable yesterday, but he said last week when confronted with the investigation findings that he was unrepentant. He denied misleading his colleagues or The Lancet.The scandal arises from the journal's publication in February 1998 of a scientific report on the "findings" in the cases of 12 autistic children, apparently admitted routinely to the Royal Free hospital in north London in 1996-97.

Wakefield was the lead author of the report. He wrote that the parents of eight of the 12 children blamed MMR: they said symptoms of autism had set in within days of vaccination. The Sunday Times has now established that four, probably five, of these children were covered by the legal aid study. And Wakefield himself had been awarded up to £55,000 to assist their case by finding scientific evidence of the link.

Wakefield did not tell his colleagues or medical authorities of this conflict of interest either during or after the research.The children were subjected to a battery of invasive procedures, including colonoscopies and lumbar punctures.

In the months that followed the examination of the first children, many more were channelled through the hospital. The parents of many were clients of one solicitor, Richard Barr, of King's Lynn, Norfolk, who was leading the legal attack and had organised Wakefield's funding from the Legal Aid Board (now the Legal Services Commission).

The research paper published in The Lancet contained no scientific evidence of a link with MMR, only the "association" made by parents. But at the unprecedented press conference to launch the report, attacked the three-in-one jab as posing risks of causing autism and bowel problems.

"It's a moral issue for me and I can't support the continued use of these three vaccines given in combination until this issue has been resolved," he said. Neither in the report nor at the conference did he disclose the legally-funded work he was doing for Barr's clients. Asked his opinion of this non-disclosure last month, Barr said: "I remember noting at the time that the funding acknowledgment wasn't there, but it didn't see to be a big deal . . . things have moved on since then."

Barr added yesterday: "My role is to do the best for my clients. Clients came to me and told me what was happening to their children."

In March 1998, as public alarm took off over the safety of MMR, a meeting of the Medical Research Council squarely asked Wakefield about the source of the children he had analysed in the Lancet report. Wakefield failed to take the opportunity to reveal his interest.Six weeks later he was faced with a letter in The Lancet raising the question of litigation. All children, Wakefield claimed, came through "formal channels" and that "no conflict of interest exists".

The medical establishment has long rejected Wakefield's claims about MMR, and in 2001 he left the Royal Free. He now travels between Britain and America, lecturing about the dangers of the vaccine.

Last weekend, aware of The Sunday Times's investigation, he flew back to Britain. He was represented by Abel Hadden, a top PR man at Sir Tim Bell's Bell Pottinger company. At a tense confrontation on Wednesday at Bell Pottinger's headquarters in Mayfair, a red-eyed Wakefield denied any wrongdoing. He said any conflict of interest in his work was "a matter of opinion"."I believe that this paper was conducted in good faith," he said. "It reported the findings. There was no conflict of interest. Do we have any reasons [now] to change our opinion? No, but then again it's a debate."

As he was speaking, the findings of the investigation were also being shown to Horton at The Lancet. Shocked, Horton later called in Wakefield and visited the Royal Free on Thursday to talk to Wakefield's former colleagues and inspect records.By Friday, Horton and his fellow editors were faced with a dilemma: should they respect The Sunday Times's confidence and wait for the storm to break today? Or rush out a press release criticising Wakefield and taking credit for Disclosing his fatal conflict of interest? They chose the latter.

Simon Murch, one of the leading doctors involved with Wakefield's research at the Royal Free, said yesterday that news of the £55,000 legal funding was "a very unpleasant surprise"."We didn't know. We were pretty taken aback. The timing of it before the paper is something we have all been shocked by. If you have a colleague who has not told you, if you have not been informed you are going to be taken aback."

He went on: "I am not going to join the queue of people rushing up to kick Andy. But it is right that this has come out: there has been a complete conflict of interest."

Murch said it was never made clear that the payment was in place before the report was published. "We never knew anything about the £55,000 – he had his own separate research fund," said Murch. "All of us were surprised . . . We are pretty angry."

He added: "This is not personal corruption. But there was a clear conflict of interest – it was not declared to us and it was not declared to the journal, and it should have been." Murch said he believed that if Wakefield had made clear his interest, The Lancet would have asked for the report to be rewritten to focus on hard fact and to "leave the speculation, leave the measles story out of there".

Another of Wakefield's 12 co-workers in the study said: "I am very, very angry. I would never have put my name to the study if I had known there was this conflict of interest, and had I not done so it would never have got published."

Another author, Dr Peter Harvey, a board member of Visceral, a registered charity set up to support Wakefield, spoke out in his defence. Harvey said he did not think the funding was relevant and he would have still have put his name to the study if he had known. "I don't think there was any conflict of interest," he said.

Dr Richard Smith, editor of the British Medical Journal, said, however: "That MMR paper is the best example there has ever been of a very, very dodgy paper that has created a lot of discomfort and misery."

Melanie Phillips

Dr Wakefield was shamefully discredited

Daily Mail, 28 April 2004, 16:12
https://www.dailymail.co.uk/columnists/article-259519/Dr-Wakefield-shamefully-discredited.html

From the moment that surgeon Andrew Wakefield first published his explosive theory suggesting a link between autism, bowel disease and the measles, mumps and rubella triple jab, the *Government and the medical establishment have been determined to discredit him and thus destroy his research*.

Over the weekend, it looked as if they had finally managed it. A report in The Sunday Times suggested that Dr Wakefield's original Lancet paper in 1998, which first indicated such links, was a scandalous manipulation of the evidence.

The report claimed Dr Wakefield had failed to tell The Lancet he had also received legal aid funds to carry out a separate study as part of the legal case being brought by parents of autistic children against the MMR manufacturers.

To make matters even worse, it alleged, some of the children in the Lancet paper were involved in the court case. The Lancet study was therefore fatally compromised, since the parents had stood to gain financially if Dr Wakefield's researches had enabled them to claim compensation.

No sooner did the story appear than the Health Secretary, Dr John Reid, demanded an urgent inquiry. However, upon examination the picture significantly changes. The Sunday Times originally made a series of claims against Dr Wakefield, which were all actually rejected by The Lancet except for the conflict of interest. But when one looks at the facts, this, too, begins to look a bit different.

Dr Wakefield's legal aid-funded study was commissioned by solicitor Richard Barr, who had been approached by parents of children sick with autism and bowel disease who wanted to take legal action against the manufacturers of MMR.

Mr Barr wanted to know whether there was clinical evidence to support such a case. So he asked Dr Wakefield to look at possible links between measles virus and bowel disease.

The Sunday Times report claimed that four or five of the 12 children in the entirely separate Lancet study were part of this legal action. But their parents only decided to go to court after they had been accepted for treatment by Dr Wakefield's team at London's Royal Free hospital.

The implication that they were selected because they were litigants with a financial interest in the results of the clinical examination is grotesque.

All 12 of them were referred through normal NHS processes, either from doctors' recommendations or after desperate parents, having heard on the grapevine of Dr Wakefield's unusual sympathy towards these problems, had contacted him of their own volition. It was only subsequently that a few of them became part of the legal case.

So the two Wakefield studies were entirely separate, with no crossover.

True, The Lancet editor has said the second study should have been disclosed to avoid the 'perception' of a conflict of interest and that had he known of its existence, he wouldn't have published Dr Wakefield's paper which was 'fatally flawed' as a result.

But surely Dr Wakefield is being accused of a conflict of interest which did not occur at the time, in order to create the false impression that he and his colleagues deliberately skewed their selection of children for investigation in The Lancet exercise to support a crack-brained theory.

Surely, he is being damned by the misleading application of hindsight, which has seriously misrepresented what happened.

In other words, this appears to be nothing other than a smear.

It is also a smear whose timing should raise a few eyebrows. For the Legal Services Commission has now cut off legal aid funding for the parents, which threatens to stop the case altogether. It just so happened that Mr Barr applied for judicial review of that decision a week ago, and judgment has been reserved. So this smear looks very like an attempt to influence the court and ensure the case dies.

And make no mistake, the stakes could not be higher. The drug companies, the Government and the medical establishment have every reason to fear this case going ahead.

For although Dr Wakefield is the focus of the frenzy, many other pieces of evidence suggest that concern over the vaccine is by no means confined to one possibly obsessive doctor.

Although the vast majority of children clearly have no adverse reaction whatever from the MMR jab, *the number of families with a very different story to tell indicate that, for a small proportion of children, something worrying may be happening*.

What is so striking is the *sheer volume of parents*, not just in Britain but in America and other countries, who tell the same story of children who were developing normally - often with videos to prove it - only to stop developing and *start suffering bowel disease after the MMR jab. Moreover, vaccine- strain measles virus has been found in the gut of some children with autism and bowel disease*.

Earlier this month Dr Jeff Bradstreet, a U.S. autism researcher, presented evidence to the Institute of Medicine in Washington *showing measles virus in the cerebral-spinal fluid of three children with autism and bowel disease*. => Bradstreet J.J. et al. Detection of measles virus genomic RNA in cerebrospinal fluid of children with regressive autism: a report of three cases. J Am Phys Surg, 2004, Summer, 9(2): 38–45.

This virus most definitely should not be there; and the question is how it got there in children who had been vaccinated against measles.

None of this proves MMR causes either bowel disease or autism; but it certainly indicates a cause for concern. The Government insists, however, that research overwhelmingly shows the vaccine is safe. But this is not so.

The research in question investigates patterns of disease based on medical records.

But this is unlikely to get to the bottom of the issue, since countless parents have said doctors not only failed to diagnose autism or bowel disease in their children but dismissed outofhand the parents' reports that the problems seemed to start with the triple jab.

In any event, these studies do not prove MMR is safe. They say there is no proof it is not safe, a very different matter. The official misrepresentation of these conclusions is one of the most worrying things about this controversy.

This is particularly so since the Government had introduced the first type of MMR vaccine in 1989 - which it had to withdraw three years later because it was shown to cause aseptic meningitis - even though the Government knew at the time that Canada had already withdrawn it because it was found to be unsafe.

And as for conflicts of interest, what about the many scientists on the Government's vaccine safety bodies who are funded by the pharmaceutical companies?

Certainly, it is extremely worrying if parents are refusing to vaccinate their children against measles, mumps and rubella, with the dangers they pose of serious illness or even death.

But not only does the Government refuse to allow the use of less worrying single jabs - it also refuses to do the one thing that could settle this matter one way or the other.

Instead of calling for an inquiry into Dr Wakefield and dismissing parents' concerns with such contempt, it should commission an independent, clinical investigation of affected children.

Only then will we be able to judge who in this wretched story is actually right, and only then will all children get the vaccinations they need.

Bradstreet J.J., Dahr J.El, Anthony A., Kartzinel J.J., Wakefield A.J.

Detection of measles virus genomic RNA in cerebrospinal fluid of children with regressive autism: a report of three cases

J Am Phys Surg, 2004, Summer, 9(2): 38–45
https://www.jpands.org/vol9no2/bradstreet.pdf

In light of encephalopathy presenting as autistic regression (autistic encephalopathy, AE) closely following measles-mumps-rubella (MMR) vaccination, three children underwent cerebrospinal fluid (CSF) assessments including studies for measles virus (MV). All three children had concomitant onset of gastrointestinal (GI) symptoms and had already had MV genomic RNA detected in biopsies of ileal lymphoid nodular hyperplasia (LNH).

Presence of MV Fusion (F) gene was examined by TaqMan real-time quantitative polymerase chain reaction (RT-PCR) in cases and control CSF samples. The latter were obtained from three non-autistic MMR-vaccinated children with indwelling shunts for hydrocephalus. None of the cases or controls had a history of measles exposure other than MMR vaccination. Serum and CSF samples were also evaluated for antibodies to MV and myelin basic protein (MBP).

MV F gene was present in CSF from all three cases, but not in controls. Genome copy number ranged from 3.7x10 to 2.42x10 per ng of RNA total. Serum anti-MBP autoantibodies were detected in all children with AE. Anti-MBP and MV antibodies were detected in the CSF of two cases, while the third child had neither anti-MBP nor MV antibodies detected in his CSF.

Findings are consistent with both an MV etiology for the AE and active viral replication in these children. They further indicate the possibility of a virally driven cerebral immunopathology in some cases of regressive autism.

=>

Preliminary evidence for an autoimmune phenomenon in some AE children reported here and elsewhere, and alternative mechanisms of encephalopathy in these children, require detailed study. These data indicate that sensitive and specific virological and immunological analysis of CSF is indicated in children undergoing AE with regression *following exposure to live virus vaccines*.

Mr. Burton of Indiana. *Mr. Speaker, I submit the following report prepared by the staff of the Subcommittee on Human Rights and Wellness, Committee on Government Reform. This report is the result of a three-year investigation initiated in the Committee on Government Reform.*

Mercury in medicine – taking unnecessary risks

I. Executive summary

Vaccines are the only medicines that American citizens are mandated to receive as a condition for school and day care attendance, and in some instances, employment. Additionally, families who receive federal assistance are also required to show proof that their children have been fully immunized. While the mandate for which vaccines must be administered is a state mandate, it is the Federal Government, through the Centers for Disease Control and Prevention (CDC) and its Advisory Committee for Immunization Practices that make the Universal Immunization Recommendations to which the majority of states defer when determining mandates. Since the early to mid 1990s, Congress has been concerned about the danger posed by mercury in medical applications, and in 1997, directed the Food and Drug Administration (FDA) to evaluate the human exposure to mercury through foods and drugs.

In 1999, following up on the FDA evaluation and pursuant to its authority, the House Committee on Government Reform initiated an investigation into the dangers of exposure to mercury through vaccination. The investigation later expanded to examine the potential danger posed through exposure to mercury in dental amalgams. This full committee investigation complemented and built upon the investigations initiated by two of its subcommittees. In January 2003, the investigation continued in the newly formed Subcommittee on Human Rights and Wellness.

A primary concern that arose early in the investigation of vaccine safety was the exposure of infants and young children to mercury, a known toxin, through mandatory childhood immunizations. This concern had been raised as a possible underlying factor in the dramatic rise in rates of late-onset or ‘acquired’ autism. The symptoms of autism are markedly similar to those of mercury poisoning.

Significant concern has been raised about the continued use of mercury in medical applications decades after the recognition that mercury can be harmful, especially to our most vulnerable population – our children.

This report will address one form of mercury in medical applications, ***Thimerosal,*** as a preservative in vaccines.

In July 2000, it was estimated that 8,000 children a day were being exposed to mercury in excess of Federal guidelines through their mandatory vaccines.

One leading researcher made the following statement to the Committee in July 2000:

"***There's no question that mercury does not belong in vaccines***."

"There are other compounds that could be used as preservatives. And everything we know about childhood susceptibility, neurotoxicity of mercury at the fetus and at the infant level, points out that we should not have these fetuses and infants exposed to mercury. There's no need of it in the vaccines."

The Food and Drug Administration's (FDA) mission is to "promote and protect the public health by helping safe and effective products reach the market in a timely way, and monitoring products for continued safety after they are in use.' However, the FDA uses a subjective barometer in determining when a product that has known risks can remain on the market. According to the agency, "at the heart of all FDA's product evaluation decisions is a judgment about whether a new product's benefits to users will outweigh its risks. No regulated product is totally risk-free, so these judgments are important. FDA will allow a product to present more of a risk when its potential benefit is great – especially for products used to treat serious, life-threatening conditions."

This argument – that the known risks of infectious diseases outweigh a potential risk of neurological damage from exposure to thimerosal in vaccines, is one that has continuously been presented to the Committee by government officials. FDA officials have stressed that any possible risk from thimerosal was theoretical: that no proof of harm existed. Upon a thorough review of the scientific literature and internal documents from government and industry, the Committee did in fact find evidence that thimerosal posed a risk. The possible risk for harm from either low dose chronic or one time high level (bolus dose) exposure to thimerosal is not "theoretical," but very real and documented in the medical literature.

Congress has long been concerned about the human exposure to mercury through medical applications. As a result of these concerns, in 1997, Congress instructed the FDA to evaluate the human exposure to mercury through drugs and foods. Through this Congressionally mandated evaluation, the FDA realized that the ethylmercury infants were exposed to in the first six months of life through their mandatory vaccinations exceeded the Environmental Protection Agency's (EPA) limit for a closely associated compound methylmercury. The FDA and other Federal agencies determined that in the absence of a specific standard for ethylmercury, the limits for ingested methylmercury should be used for injected ethylmercury. The Institute of Medicine, in 2000, evaluated the EPA's methylmercury standard and determined that based upon scientific data that it, rather than the FDA's, was the scientifically validated safe exposure standard.

Rather than acting aggressively to remove thimerosal from children's vaccines, the FDA and other agencies within the Department of Health and Human Services (HHS) adopted an incremental approach that allowed children to continue to be exposed to ethylmercury from vaccines for more than two additional years. In fact, in 2001, the Centers for Disease Control and Prevention (CDC) refused even to express a preference for thimerosal-free vaccines, despite the fact that thimerosal had been removed from almost every childhood vaccine produced for use in the United States.

On three occasions in the last 15 years, changes have been made to vaccine policies to reduce the risk of serious adverse effects. First, a transition from oral polio vaccine to injected polio was accomplished in the United States to reduce the transmission of vaccine-induced polio. Second, an a cellular pertussis vaccine was developed and a transition from DTP to DTaP was accomplished to reduce the risk of pertussis—induced seizures in children. And third, when the Rotashield vaccine for rotavirus was linked to a serious bowel condition (intersucception), it was removed from the U.S. market. Ethylmercury has been largely removed from every major childhood vaccine manufactured for use in the United States, except the influenza vaccine, which continues to contain trace amounts.

This success, however, does not change the fact that millions of American children were exposed to levels of mercury through vaccines that exceeded comparable federal guidelines. Many parents, and a growing number of scientists, believe that this ***mercury exposure may have*** *contributed to the explosive growth in autism spectrum disorders, and neurological and behavioral disorders that this country has experienced*. The scientific evidence in this area is considered by some to still be

inconclusive, in large part due to the lack of serious, effective inquiry by our health agencies. The federal government has an obligation to vigorously pursue the necessary research to determine the extent of the impact of these heightened exposures to ethylmercury on our population.

A second concern that arose during the investigation was the continued use of mercury in dental amalgams. Mercury has been used as a component in dental fillings since the Civil War era. The American Dental Association and its member dentists have taken a position that the mercury in fillings, which are considered toxic until placed in the tooth, and is considered toxic when removed from the mouth, is completely safe while in the human mouth. This position seems counter even to the ADA-funded research that shows the daily release of small amounts of mercury vapors in the human mouth where dental amalgams are present, as well as minute chipping and swallowing of the mercury fillings over time.

Babies and young children are exposed to this additional mercury. As_ developing fetuses, babies are exposed to mercury through the placenta. If pregnant women have mercury amalgams, they are unknowingly excreting low levels of mercury on a daily basis to their fetuses. Additionally, children who receive dental services through Medicaid are also potentially exposed to mercury. When these children need dental fillings, because of the low cost, only mercury amalgams are available for use. This concern remains under investigation by the Subcommittee on Human Rights and Wellness.

II. Findings and Recommendations

A. *Findings investigation the following Through this vaccine safety, made*:

1. Mercury is hazardous to humans. Its use in medicinal products is undesirable, unnecessary and should be minimized or eliminated entirely.

2. For decades, ethylmercury was used extensively in medical products ranging from vaccines to topical ointments as preservative and an anti-bacteriological agent.

3. Manufacturers of vaccines and thimerosal, (an ethylmercury compound used in vaccines), have never conducted adequate testing on the safety of thimerosal. The FDA has never required manufacturers to conduct adequate safety testing on thimerosal and ethylmercury compounds.

4. Studies and papers documenting the hyperallergenicity and toxicity of thimerosal (ethylmercury) have existed for decades.

5. Autism in the United States has grown at epidemic proportions during the last decade. By some estimates the number of autistic children in the United States is growing between 10 and 17 percent per year. The medical community has been unable to determine the underlying cause(s) of this explosive growth.

6. At the same time that the incidence of autism was growing, the number of childhood vaccines containing thimerosal was growing, increasing the amount of ethylmercury to which infants were exposed threefold.

7. A growing number of scientists and researchers believe that a relationship between the increase in neurodevelopmental disorders of autism, attention deficit hyperactive disorder, and speech or language delay, and the increased use of thimerosal in vaccines is plausible and deserves more scrutiny. In 2001, the Institute of Medicine determined that such a relationship is biologically plausible, but that not enough evidence exists to support or reject this hypothesis.

8. The FDA acted too slowly to remove ethylmercury from over-the-counter products like topical ointments and skin creams. Although an advisory committee determined that ethylmercury was unsafe in these products in 1980, a rule requiring its removal was not finalized until 1998.

9. The FDA and the CDC failed in their duty to be vigilant as new vaccines containing thimerosal were approved and added to the immunization schedule. When the Hepatitis B and Haemophilus Influenza Type b vaccines were added to the recommended schedule of childhood immunizations, the cumulative amount of ethylmercury to which children were exposed nearly tripled.

10. The amount of ethylmercury to which children were exposed through vaccines prior to the 1999 announcement exceeded two safety thresholds established by the Federal government for a closely related substance – methylmercury. While the Federal Government has established no safety

threshold for ethylmercury, experts agree that the methylmercury guidelines are a good substitute. Federal health officials have conceded that the amount of thimerosal in vaccines exceeded the EPA threshold of 0.1 micrograms per kilogram of bodyweight. In fact, the amount of mercury in one dose of DTaP or Hepatitis B vaccines (25 micrograms each) exceeded this threshold many times over. Federal health officials have not conceded that this amount of thimerosal in vaccines exceeded the FDA's more relaxed threshold of 0.4 micrograms per kilogram of body weight. In most cases, however, it clearly did.

11. The actions taken by the HHS to remove thimerosal from vaccines in 1999 were not sufficiently aggressive. As a result, thimerosal remained in some vaccines for an additional two years.

12. The CDC's failure to state a preference for thimerosal-free vaccines in 2000 and again in 2001 was an abdication of their responsibility. As a result, many children received vaccines containing thimerosal when thimerosal-free alternatives were available.

13. The Influenza vaccine appears to be the sole remaining vaccine given to children in the United States on a regular basis that contains thimerosal. Two formulations recommended for children six months of age or older continue to contain trace amounts of thimerosal. Thimerosal should be removed from these vaccines. No amount of mercury is appropriate in any childhood vaccine.

14. The CDC in general and the National Immunization Program in particular are conflicted in their duties to monitor the safety of vaccines, while also charged with the responsibility of purchasing vaccines for resale as well as promoting increased immunization rates.

15. There is inadequate research regarding ethylmercury neurotoxicity and nephrotoxicity.

16. There is inadequate research regarding the relationship between autism and the use of mercury-containing vaccines.

17. To date, studies conducted or funded by the CDC that purportedly dispute any correlation between autism and vaccine injury have been of poor design, under-powered, and fatally flawed. The CDC's rush to: support and promote such research is reflective of a philosophical conflict in looking fairly at emerging theories and clinical data related to adverse reactions from vaccinations.

B. *Recommendations*

1. Access by independent researchers to the Vaccine Safety Datalink database is needed for independent replication and validation of CDC studies regarding exposure of infants to mercury-containing vaccines and autism. The current process to allow access remains inadequate.

2. A more integrated approach to mercury research is needed. There are different routes that mercury takes into the body, and there are different rates of absorption. Mercury bioaccumulates; the Agency for Toxic Substances and Disease Registry (ATSDR) clearly states: "'This substance may harm you." Studies should be conducted that pool the results of independent research that has been done thus far, and a comprehensive approach should be developed to rid humans, animals, and the environment of this dangerous toxin.

3. Greater collaboration and cooperation between federal agencies responsible for safeguarding public health in regard to heavy metals is needed.

4. ***The President should announce a White House conference on autism*** to assemble the best scientific minds from across the country and mobilize a national effort to uncover the causes of the autism epidemic.

5. Congress needs to pass legislation to include in the National Vaccine Injury Compensation Program (NVICP) provisions to allow families who believe that their children's autism is vaccine-induced the opportunity to be included in the program. Two provisions are key: First, extending the statute of limitations as recommended by the Advisory Commission on Childhood Vaccines from 3 to 6 years. Second, establishing a one to two-year window for families, whose children were injured after 1988 but who do not fit within the statute of limitations, to have the opportunity to file under the NVICP.

6. Congress should enact legislation that prohibits federal funds from being used to provide products or pharmaceuticals that contain mercury, methylmercury, or ethylmercury unless no reasonable alternative is available.

7. Congress should direct the National Institutes of Health to give priority to research projects studying causal relationships between exposure to mercury, methylmercury, and ethylmercury to autism spectrum disorders, attention deficit disorders, Gulf War Syndrome, and Alzheimer's Disease.

III. Thimerosal has been used in vaccines and other medical products for decades

A. *A brief description of mercury*

Mercury is a silver-colored metal, which unlike any other metal, is a liquid at room temperature. It flows so easily and rapidly that it is sometimes called quicksilver. The chemical symbol for Mercury is Hg.

Mercury has many properties that have made it popular for a number of commercial uses. For example, mercury expands and contracts evenly when heated or cooled. It also remains liquid over a wide range of temperatures and does not stick to glass. These properties have prompted its use in thermometers. Mercury conducts electricity and is used in some electric switches and relays to make them operate silently and efficiently. Industrial chemical manufacturers use mercury in electrolysis cells to charge substances with electricity. Mercury vapor, used in fluorescent lamps, gives off light when electricity passes through it. Before its health effects were well understood, mercury compounds were widely used in such common products as house paints and paper.

Various alloys (mixtures of metals) containing mercury have many uses. Mercury alloys are called amalgams. These would include silver amalgam, a mixture of silver and mercury that dentists use to fill cavities in teeth.

Mercury comes in many different forms – organic, inorganic, elemental, and metallic. As a result of its many practical uses, mercury became widespread in the environment. However, *it is now widely recognized that overexposure to all forms of mercury can harm the central nervous system (brain) and the renal system (kidneys)*. This has led to regulatory actions to reduce the exposure of humans to mercury on many fronts. According to the Agency for Toxic Substances and Disease Registry (ATSDR): "*The nervous system is very sensitive to all forms of mercury*."

B. *Thimerosal, which contains ethylmercury, has been used in medicines since the 1930's*

In addition to its many commercial applications, mercury has been used in a number of medical applications. One such product that came into frequent use during the twentieth century was thimerosal. Thimerosal is an organic compound made up of equal parts of thiosalicylic acid and ethylmercury. It is 49.6 percent ethylmercury by weight.

Thimerosal was developed by Dr. Morris Kharasch (1895-1957; Ukraine/USA), a chemist and Eli Lilly fellow first at the University of Maryland (1922-1927) and then at the University of Chicago. He filed for a patent on June 27, 1929, for what he described as an alkyl mercuric sulfur compound (thimerosal), which he felt had potential as an antiseptic and antibacterial product. Dr. Kharasch was considered a pioneer in his field, contributing to the development of plastics and the creation of synthetic rubber. He also went on to found the Journal of Organic Chemistry.

In October 1929, Eli Lilly and Company registered thimerosal under the trade name Merthiolate.

...

C. *Mercury is a known neurotoxin, but methylmercury has been more carefully studied than ethylmercury*

After more than a century of research, it has become widely accepted in the scientific and medical communities that mercury is a neurotoxin. While debate continues over what levels of exposure to mercury are safe, it is unquestioned today that overexposure to mercury in any form can cause neurological and renal damage. There is also a growing consensus around the theory that some individuals are more susceptible to harm from mercury than others, confounding efforts to adopt a population-level threshold for safe levels of mercury in the environment. A research paper published in 2002 summarized the scientific consensus very succinctly: "*Mercury and its compounds are cumulative toxins and in small quantities are hazardous to human health*."

Because of its many commercial applications and its widespread presence in the environment. Methylmercury received the lion's share of the attention in the scientific community during the twentieth century. A concise history of the early development of scientific knowledge about methylmercury is found in Dr. Thomas Clarkson's, "The Three Modern Faces of Mercury":

"The first methylmercury compounds were synthesized in a chemical laboratory in London in the 1860s. Two of the laboratory technicians died of methylmercury poisoning. This so shocked the chemical community that methylmercury compounds were given a wide berth for the rest of the century ... early in the twentieth century the potent anti-fungal properties ... were discovered, leading to applications to seed grains, especially for cereal crops Despite the widespread use, few cases of poisoning were reported for the first half of the twentieth century. However, in the late 1950s and 1960s serious outbreaks of alkyl mercury poisoning (methylmercury) erupted in several developing countries ... Also in the late 1950s. evidence emerged of environmental damage from treated grain. It was observed in Sweden that predatory birds were developing neurological disorders analysis, indicated a sharp rise in mercury levels."

Public health concerns about methylmercury in the edible tissue of fish suddenly erupted in 1969 when fish from Lake St. Clair bordering Michigan were found to have high levels. This and other findings have maintained public health concerns over this form of mercury."

As a result of these emerging concerns, public health officials worldwide began researching methylmercury. Today, the scientific literature is replete with evidence on toxic effects of methylmercury. In 2000, the National Academy of Sciences published Toxicological Effects of Methylmercury, which concluded:

Methylmercury is highly toxic.

The data indicate that the adverse effects of methylmercury exposure can be expressed in multiple organ systems throughout the lifespan.

The research in humans on the neurodevelopmental effects of methylmercury is extensive.

Damage to renal tubules and nephron has been observed following human exposure to inorganic and organic forms of mercury. Symptoms of renal damage have been seen only at mercury exposures that also caused neurological effects.

The cardiovascular system appears to be a target for methylmercury toxicity in the same dose range as neurodevelopmental effects – at very low mercury exposures.

Studies in humans on the carcinogenic effects of methylmercury are inconclusive.

Methylmercury may increase human susceptibility to infectious disease and autoimmune disorders by damaging the immune system.

Methylmercury may adversely affect the reproductive system.

The medical literature is replete with references to the dangers to methylmercury:

"The major toxic effects of methylmercury are on the central nervous system. Its toxic action on the developing brain differs in both mechanism and outcome from its action on the mature organ the action of methylmercury on adults is characterized by a latent period between exposure and onset of symptoms. The period can be several weeks or even months, depending on the dose and exposure period . . . paresthesia, numbness or a 'pins and needles' sensation is the first symptom to appear at the lowest dose. This may progress to cerebella ataxia, dysarrthia, constriction of the visual fields, and loss of hearing. . . . Cardiovascular disease ... accelerated progression of carotid arteriosclerosis."

The research is explicit that fetal brains are more sensitive than the adult brains to the adverse effects of methylmercury, which include:

Severe brain damage
Delayed achievement of developmental milestones
Neurological abnormalities such as brisk tendon reflexes
Widespread damage to all areas of the fetal brain, as opposed to focal lesions seen in adult tissue
Microcephaly
Purkinje [neuron] cells failed to migrate to the cerebellum

Inhibition of both cell division and migration, affecting the most basic process in brain development

Additionally, elevation in both systolic and diastolic blood pressure in seven year olds correlated with prenatal exposure to methylmercury ... indicative of later cardiovascular problems.

Despite the fact that ethylmercury has been widely used in common medical treatments, ranging from vaccines to nasal sprays to ointments, comparatively little research has been done on its health effects. The few studies that have been done tend to indicate that ethylmercury is just as toxic as methylmercury.

The FDA never required the pharmaceutical industry to conduct extensive safety studies on thimerosal or ethylmercury. It appears that our Federal regulatory framework (the FDA and its predecessor organizations) failed to require manufacturers to prove thimerosal was safe. They failed to require industry to conduct adequate testing to determine how thimerosal is metabolized. The FDA failed to require that industry conduct studies to determine the maximum safe exposure level of thimerosal. These basic issues should have been proven prior to the introduction of thimerosal into the marketplace, but more than 70 years after its introduction, these issues have still not been adequately addressed. The introduction of thimerosal appears to have been based on a single uncontrolled and poorly reported human study in the 1920s, possibly in combination with animal and laboratory studies. However, this sole human study was not a true safety study and produced a faulty foundation on which to build a *robust vaccine program in which young children would be forced to be repeatedly injected with multiple doses of ethylmercury*.

...

D. *Because of its toxicity, mercury has become heavily regulated.*

As the dangers of mercury have become better understood, the United States and other governments around the world have taken actions to reduce the release of mercury into the environment. In 1972, the federal government halted the use of mercury compounds for many industrial uses, such the paint used on the hulls of ships and compounds used to prevent the growth of fungi in lumber, because the mercury had leached into the environment and found its way into the human food chain.

In 1972, while certain agencies within the federal government recognized that mercury was a *Cumulative poison that damaged brain cells*, the FDA's vaccine division seems to have ignored the issue until 1999.

1. The EPA is Regulating the Release of Mercury into the Environment

...

2. Different Limits to Exposure to Mercury have been Established by Different Agencies

...

3. Warnings have been Issued about Mercury in Seafood

...

4. Over the course of two decades, the FDA slowly removed Ethylmercury from many Medicinal Products

...

E. *Thimerosal is still used in some medical products*

While the FDA has taken steps over the last 20 years to remove ethylmercury from topical ointments and most pediatric vaccines, a number of medical products continue to contain this preservative.

Some nasal and ophthalmic products containing thimerosal remain on the market.

About 75 percent of the flu vaccines, recently recommended to be given to children as young as six months. contain at least trace amounts of thimerosal.

Many adult vaccines contain thimerosal.

Vaccines containing thimerosal continue to be manufactured in the United States and delivered through the World Health Organization (WHO) to Third World Countries.

The WHO has continued to require the use of multi-dose vials and to use preservatives, including thimerosal, to address storage and transportation issues.

Of additional concern to the Committee, but not discussed in detail within this report, is the continued use of thimerosal in adult vaccines. There is a growing emphasis on adult immunizations.

including getting boosters to childhood immunizations. Additionally, all new military recruits, active duty, and reserve forces that are deploying overseas are routinely given a large number of vaccines, many containing ethylmercury. These vaccines are often given consecutively and all in the same day.

...

The Committee received documentation from one Air Force pilot who suffered from serious symptoms of Gulf War Syndrome. After failing to have his medical issues resolved through the military or the Veterans Administration (VA) medical system, Captain Frank Schmuck, a pilot, became so ill that he was no longer able to fly. He sought medical treatment outside the military medical system and *was tested for heavy metals, and was found to have toxic levels of mercury in his system*. After chelation therapy, he returned to good health and has resumed flying. Gulf War Syndrome victims are not routinely tested for heavy metal toxicity or treated with chelation therapy by the military or the VA. Given the lack of progress in finding other successes with recovery from this condition, this is an issue that both the Department of Defense (DOD) and the VA should be aggressively evaluating on behalf of Gulf War veterans.

IV. There are growing questions about whether mercury in childhood vaccines is related to autism spectrum disorders

A. Autism Is Growing at Epidemic Proportions

1. ***Introduction***

Autism was once considered a rare disease that affected an estimated 1 in 10,000 individuals in the United States. The Committee held its first hearing on the dramatic rise in autism in April of 2000. At the time, Federal agencies were estimating that autism affected 1 in 500 children in the United States. By 2002, the National Institutes of Health had adjusted that rate to 1 in 250 children in the United States. The Autism Society of America estimates that the number of autistic children is growing by 10 to 17 percent each year.

In that first hearing, Chairman Burton reported that according to U.S. Department of Education statistics, requests for services for school-age children with autism spectrum disorders had risen dramatically in every state.

Mr. Burton: "California has reported a 273 percent increase in children with autism since 1988 .... Florida has reported a 571 percent increase in autism. .Maryland has reported a 513 percent increase between 1993 and 1998... In 1999, there were 2,462 children ages 3 to 21 in Indiana diagnosed with autism. That is one-fourth of 1 percent of all the school children in Indiana. or 1 out of every 400... . This increase is not just better counting. If we want to find a cure, we must first look to the cause."

In July 2000, Dr. Stephanie Cave shared her observations about the rapid growth of autism and the pressures it is placing on families and medical professionals:

"I am in family practice in Baton Rouge, LA. I want to express my deep appreciation to you and to the members of the committee for allowing me to testify. I am presently treating over 300 autistic children, with an additional 150 waiting to get in.

"We are treating children from all over the United States and getting calls from many places around the globe. This is truly an epidemic. If you have any idea that it is not, I invite you to sit in my office for 2 hours."

2. *Studies Are Documenting the Incredible Growth of Autism*

In the 1990's, the CDC conducted two prevalence studies that confirmed dramatic spikes in autism cases. One was conducted in Brick Township, New Jersey. the other in Atlanta, Georgia.

In late 1997, after noticing an apparently larger than expected number of children with autism in their community. a citizen's group in Brick Township, New Jersey, contacted the New Jersey Department of Health and Senior Services (DHSS). Because of the complexity of the disorder and the concerns that environmental factors might play a role, the New Jersey DHSS, U.S. Senator

Robert Torricelli, and U.S. Representative Christopher Smith contacted the CDC and the ATSDR for assistance. In response, the CDC conducted an extensive prevalence investigation.

The rate of autism among children in Brick Township was 4 per 1.000 (1 in 250) children aged 3 through 10 years. The prevalence of the more broadly defined autism spectrum disorder was 6.7 per 1,000 (1 in 150) children. It is important to note that even though the families of Brick Township requested that the CDC include an evaluation of a possible link between autism and their children's immunization, the CDC chose not to do so. Their evaluation of the cause of the cluster of autism in Brick Township was inconclusive.

The CDC's Atlanta study confirmed the dramatic results of the Brick Township study. The CDC found that 1.987 of the 289,456 children aged 3 to 10 years in metropolitan Atlanta in 1996 were autistic (1 in 146). These numbers were 10 times higher than studies conducted in the 1980s and early 1990s.

Last November, a study on autism in California determined that the number of autistic individuals in that state has nearly tripled. Equally important, the study stated that the increase was real, and could not be explained by changes in diagnostic criteria or better diagnoses. The study, funded by the state legislature and conducted by the University of California at Davis, determined that the number of autistic people in that state grew by 273% between 1987 and 1998.

The main author of the study, Dr. Robert Byrd, said, "It is astounding to see a threefold increase in autism with no explanation . - . there's a number of things that need to be answered. We need to rethink the causes of autism."

The 2002 report confirmed a 210 percent increase in the number of new children professionally diagnosed with the most severe cases of autism entering the developmental services system between 2001 and 2002. The system added 3,577 new cases in 2002.

It is important to note that the figures reported in California do not include persons with Pervasive Developmental Disorder (PDD), PDD-Not Otherwise Specified (PDDNOS). Asperger's Syndrome. or any of the other milder autism spectrum disorders. The California data reflect only those children who have received a professional diagnosis of level one, DSM IV autism – the most severe form of autism.

3. *The Causes of the Autism Epidemic are not Known*

The underlying causes of the explosion in autism remains a mystery. While the medical community has made many advances over the years in developing treatments and better diagnostic tools, little progress has been made in understanding why some children become autistic.

Mr. Waxman: "Autism is a particularly frustrating disease. We still do not understand what causes it and we still do not have a cure. All we know for sure is that its impact on families can be devastating, During the hearings held in this committee, we have heard parents tell tragic stories of children who appear to be developing normally and then all of a sudden retreat into themselves, stop communicating, and develop autistic behavior. Other parents have testified that their children never start to develop language skills, and instead early on manifest symptoms of autism. I can only imagine how frustrating and difficult this must be for families. And I appreciate how urgently we need to understand what causes autism, how to treat it, and if possible, how to prevent it."

A summary of the developing theories on the causes of autism, as described in "Autism & Vaccines: A New Look at an Old Story" by Barbara Loe Fisher is paraphrased below:

In 1943, when child psychiatrist Leo Kanner first described 11 cases of a new mental illness in children he said was distinguished by self-absorbed detachment from other people and repetitive and bizarre behavior, he used the word "autistic" (from the Greek word auto, meaning "self.") Pointing out similarities with some behaviors exhibited by adult schizophrenics, Kanner and other psychiatrists assumed autistic children were exhibiting early-onset adult-type psychoses. Kanner's young patients came from well-educated middle and upper class families in Baltimore with mothers

and fathers who were doctors, lawyers and professors. In 1954, Kanner said, "We have not encountered any one autistic child who came of unintelligent parents." This concentration of autistic children in educated and professionally successful families led Kanner to develop the "refrigerator Mom" theory as the cause of autism, theorizing that the warm maternal instincts of educated working mothers was absent or diminished. Influenced by Kanner, pediatricians for decades were persuaded to blame mothers of autistic children for being cold and emotionally rejecting, causing the children in turn to coldly reject contact with other people.

By 1954, Kanner began modifying his "Blame the Mother" position in light of evidence that brothers and sisters of autistic children were often well-adjusted, high functioning children, These findings suggested that the development of autism was also a result of genetic or "constitutional inadequacies," as well as bad parenting. In 1971, Kanner admitted that Mothers were not to blame. However, psychoanalyst Bruno Bettleheim continued purporting the "rejecting parent" theme. Bettleheim, a holocaust death-camp survivor, insisted that the autistic child was behaving in abnormal ways in retaliation against a rejecting mother who had traumatized the child by failing to provide enough love or attention.

However, a California psychologist and father of an autistic child, Bernard Rimland, Ph.D., in 1964 disproved Dr. Bettleheim's theories through the publication of his landmark book Infantile Autism: The Syndrome and Its Implications for a Neural Theory of Behavior. In this book, Dr. Rimland methodically dismantled the psychoanalytic theory of autism and argued for a biological, specifically a neurological, basis for autistic behavior. Dr. Rimland documented the similarities between brain injured children and autistic children, liberating parents from the destructive guilt associated with having an autistic child and pointing autism research in the direction of investigating the biological mechanisms underlying the brain and immune dysfunction symptoms and their possible causes.

In 1965, Dr. Rimland established the Autism Society of America (ASA). In 1967 he established the Autism Research Institute (ARI) and began distributing a questionnaire to parents of autistic children. Some 36 years later, his databank includes information on more than 30,000 cases of autism from around the world. In analyzing the data for age of onset of autism, he discovered that before the early 1980's, most of the parents reported their children first showed signs of abnormal behavior from birth or in the first year of life. But after the mid-1980's, there was a reversal of this pattern. The numbers of parents reporting that their children developed normally in the first year and a half of life and then suddenly became autistic doubled. Today, Rimland says that the onset-at-18-months children outnumber the onset-at-birth children by 2 to 1.

Today, no one can pinpoint the exact cause or causes of autism. Nor is there any conclusive explanation for the rapid growth in cases of late-onset autism. Most experts believe that some combination of genetic and environmental factors must be at work. A leading and prominent theory is that the growing amount of mercury in childhood vaccines may have triggered an autistic response in children who are genetically predisposed to being vulnerable to mercury damage.

B. The alarming growth in autism coincided with an increase in the number *of childhood vaccines containing thimerosal* on the recommended schedule

Through most of the twentieth century, individuals were required to receive very few vaccines. However, with the licensing of the Hepatitis B (Hep B) vaccine and the Haemophilus Influenzae Type B (Hib) vaccine starting in the mid-to-late 1980's, and their subsequent recommendation for universal use in 1991, the amount of mercury to which infants were exposed rose dramatically. It was during this period of increased exposure to thimerosal and its ethylmercury component that the growing wave of late-onset autism became apparent. This confluence of events led many to suspect a correlation between the two and call for more research into the relationship between ethylmercury in vaccines and autism spectrum disorders.

A number of vaccines never contained thimerosal. These classes of vaccines are generally live-virus vaccines. The ethylmercury in thimerosal would kill the living virus, making it unsuitable for such vaccines. These shots include the Measles-Mumps-Rubella (MMR) vaccine, the oral polio vaccines (which are no longer recommended for use in the United States), and the chicken pox (varicella zoster) vaccines.

Prior to the approval of the recombinant Hepatitis B vaccine in 1986, the only vaccine containing thimerosal routinely given to infants was the DTP vaccine. DTP contained 25 micrograms of ethylmercury and was given 3 times in the first six months of life (75 micrograms of ethylmercury) and a total of four times in two years (100 micrograms of ethylmercury).

The polysaccaride Haemophulus Influenzae B (Hib) vaccine was first licensed in 1985. It had 25 micrograms of ethylmercury and was given 3 times in the first six months of life (75 micrograms of ethylmercury) and a total of four times in the first two years of life.

The approval of the Hep B vaccine in 1986 added another thimerosal-containing shot to the recommended schedule. This vaccine contained 12.5 micrograms of ethylmercury and was given within hours of birth and a total of 3 times in the first six months of life (37.5 micrograms of ethylmercury).

After 1986, some children went from getting 25 micrograms in one day or 75 micrograms in the first six months of life to getting 62.5 micrograms of ethylmercury in a day or 187.5 micrograms in the first six months of life. This would be in addition to any fetal exposure to mercury from the mother. In 1991, the CDC recommended that both Hib and Hep B be added to the universal recommendations for childhood immunization.

As was noted previously, the effects of ethylmercury have not been studied as carefully as methylmercury. and the Federal Government has not established safety thresholds tor ethylmercury exposure, Because of the obvious similarities between the two, however, when the FDA reviewed the amount of injected ethylmercury in vaccines in 1999, they compared it to the Federal limits for (ingested) methylmercury exposure. They were compelled to admit at that point that the cumulative amount of ethylmercury in vaccines exceeded the EPA’s threshold for exposure to methylmercury. This led the FDA to recommend the removal of thimerosal from most pediatric vaccines in 1999, more than a decade after the Hepatitis B vaccine was added to the schedule.

In point of fact, the potential problem was worse than the FDA suggested. Not only did the cumulative amount of ethylmercury on the routine schedule exceed the EPA's limit. the amount of ethylmercury in each individual shot of DTP (or DTaP) and Hepatitis B exceeded the limit. Young children were getting three boosters of each shot. The EPA's threshold is 0.1 micrograms of methylmercury for each kilogram of body weight. This does not mean that injury would definitely occur above this level because a significant safety margin is built in.

However, the chances of injury increase as the exposure rises above this level. For an 11-pound baby (five kilograms), the threshold would be roughly 0.5 micrograms. For a 22-pound baby (ten kilograms). the threshold would be 1 microgram. The DTP (and DTaP) vaccine contained 25 micrograms of thimerosal per dose, as does the Hepatitis B vaccine. The Hib vaccine contained 12.5 micrograms per dose. In addition, it is clear that for many, many children. the amount of thimerosal they received in vaccines in the 1990's also exceeded the FDA's higher threshold of 0.4 micrograms per kilogram of body weight.

Of particular concern to many parents are those instances in which children - received several vaccines in one visit to their pediatrician. This practice has become commonplace with the new vaccine schedules recommending 26 doses of vaccines before school attendance.

Chairman Burton spoke about one such incident at a recent hearing: "The FDA recently acknowledged that in the first 6 months of life children get more mercury than is considered safe by

the EPA. The truth is that sometimes kids go to their doctor's office and get four or five vaccines at the same time. My grandson received vaccines for nine different diseases in 1 day. He may have been exposed to 62.5 micrograms of mercury in 1 day through his vaccines. According to his weight, the maximum safe level of mercury he should have been exposed to in 1 day is 1.5 micrograms, so that. is 41 times the amount at which harm can be caused.

When testifying before the Committee, Mrs. Lynn Redwood made the following observation regarding her son's bolus exposure to mercury through vaccinations: "According to the EPA criteria, his allowable dose was only 0.5 micrograms based on his weight. He had received 125 times his allowable exposure on that day. The large injected bolus exposures continued at two months, four months, 12 months, and 18 months to a total mercury exposure of 237.5 micrograms. I also discovered that the injections that I received during my pregnancy. the first and third trimesters, and hours after the delivery of my son to prevent RH blood incompatibility disease also contained mercury."

Concern that autism may be linked to vaccines is not a new debate. Twelve years ago. the Institute of Medicine was asked to evaluate the science on a possible connection. The Institute of Medicine published Adverse Effects of Pertussis and Rubella Vaccines and confirmed that pertussis and rubella vaccines can cause brain and immune system damage. At the time, an increasing number of parents reported that their previously normal children were regressing into autism after DTP or MMR vaccination. However, the IOM physician committee charged with analyzing the medical literature for evidence of cause and effect, rejected the reported link between pertussis vaccine and autism, because 'no data were identified [in the medical literature] that address the question of a relation between vaccination with DTP or its pertussis component and autism."

Dr. Stephanie Cave, who provided testimony to the Committee. is a doctor in Baton Rouge, Louisiana whose medical practice is focused on treating children with the symptoms of autism. She concurs with other experts from whom the Committee received testimony that there appears to be a correlation between increased use of vaccines containing thimerosal and a rise in autism:

"I believe that the introduction of the hepatitis B vaccine in 1991 has sparked this recent epidemic because of thimerosal. When added to the mercury imparted through the DTP and HIB, the exposure to mercury exceeds EPA safe limits for the metal if you consider a bolus dose on a single day.

"The EPA limits are usually related to ingested mercury, which is partially cleared by the liver. Injecting boluses of ethylmercury presents an entirely different, another scenario. The 2-month dose of mercury is at least 30 times higher than the recommended daily maximum exposure set by the EPA. During the 1990's, infants received 12.5 micrograms of mercury at birth, followed by 12.5 micrograms at 1 month. 62.5 micrograms at 2 months, 50 micrograms at 4 months, 50 micrograms at 6 months, 50 micrograms at 15 to 18 months; a total of 237.5 micrograms for a child who at best weighs 10 kilograms. This far exceeds the safety limits if you consider bolus dosing. Safety limits would be more like 1 to 1.5 micrograms.

"The bile production is minimal in infancy, making it more difficult for metals to be cleared from the body. When added to a vaccine, the metals are even more dangerous because the vaccines trigger immune reactions that increase the permeability of the GI tract and the blood brain barrier.

"The injection of mercury appears to affect only certain children, but I fear that we've underestimated the devastation by concentrating only on the autistic children. We're measuring elevated levels of mercury in other children with milder difficulties like learning disabilities. ADHD. Asperger's Syndrome and many others. We do not have any idea what the scope of this problem is at this point. And there are no safety standards for infants getting bolus doses of ethylmercury."

V. Valid Concerns about Mercury in Vaccines were ignored by Federal Policymakers and Vaccine Manufacturers for decades

As early as 1931, scientists were noting adverse reactions to thimerosal. In fact, Dr. Kharasch filed a new patent application because he reformulated the product to "stabilize merthiolate due to its tendency to acquire ‘certain burning qualities’."

In 1932, in a paper published by Lilly researchers who found Merthiolate to be a skin-disinfecting agent, it was noted that another researcher has seen adverse reactions. "Reimann has reported that some individuals display a sensitiveness to thio [thimerosal] compounds, which is characterized by reddening of the treated area and the appearance of small papules and vesicles."

In 1935, in a letter from the Director of Biological Services, of the Pittman-Moore Company to Dr. Jamieson of Eli Lilly, "we have obtained marked local reaction in about 50 percent of the dogs injected with serum containing dilutions of Merthiolate varying from 1 in 40,000 to 1 in 5,000... no connection between the lot of serum and the reaction. In other words, Merthiolate is unsatisfactory as a preservative for serum intended for use on dogs... . I might say that we have tested Merthiolate on humans and find that it gives a more marked local reaction than does phenol and tricresol."

In 1942, an Army doctor in Baltimore, Maryland published a journal paper in which he raised concerns about thimerosal: "Some investigators claim that if a patient's skin is sensitive to one of the mercurials he may be sensitive to any compound containing mercury. We have investigated 5 patients with dermatitis due to Merthiolate and found that four were sensitive to Merthiolate and not to any other organic or inorganic mercury compounds with which they were tested... Sulzberger found that in performing routine patch tests with 10 percent ammoniated mercury ointment and 10 percent salicylic acid ointment he obtained relatively few positive reactions: but if the two ointments were combined so that the concentration was five percent of each, then 50 percent of all patients tested gave positive reactions." Dr. Elliss further explained in his paper, "Dr. J. H. Mitchell in a lecture before the American Academy of Dermatology in New York in December 1941, stated that he had observed a number of cases of severe dermatitis following the treatment of dermatophytosis with preparations of Merthiolate."

In 1943. Dr. Elliss published a case report in the Archives of Opthalmology, which states:

"The positive results of patch tests demonstrated that the two patients were sensitive to tincture of merthiolate were also sensitive to 1:5000 merthiolate ophthalmic ointment and that merthiolate is capable of causing an inflammation of the mucous membrane in patients who are sensitive to the drug. In view of these facts it is recommended:

1. That Merthiolate ophthalmic ointment should not be used in or about the eye unless it has been previously demonstrated by patch tests that the patient is not sensitive to the ointment.
2. That the package should be labeled to warn the consumer that such tests should be made previous to the use of merthiolate ophthalmic ointment in or about the eye. Since a patient may become sensitized to Merthiolate while using the ophthalmic ointment. it may be advisable to withdraw this product from the market before a case of permanent ocular damage occurs, in spite of the fact that no cases of ocular injury due to merthiolate have been reported."

Taken from an October 1978, letter from William R. Gibson to Dr. Alan Baskett, of the Commonwealth Laboratories in Victoria, Australia regarding a concern that thimerosal in the Australian pertussis vaccine was linked to intersucception in mice:

"I discussed the possible effect of ethylmercury with Bordetella pertussis to supplement B-adrenergic blockade. Again, it was not believed that this blockade should predispose toward intessusception, although it was recognized that increased motility resulted and that this could be causative. As with other chemicals of its generation, data relating to its safety and pharmacological effects in animal models are sparse."

In August of 1998, an FDA internal "Point Paper" was prepared for the Maternal Immunization Working Group. This document, prepared almost a full year before the Public Health Service – American Academy of Pediatrics joint statement made the following recommendation:

"For investigational vaccines indicated for maternal immunization. the use of single dose vials should be required to avoid the need of preservative in multi-dose vials .... Of concern here is the potential neurotoxic effect of mercury especially when considering cumulative doses of this component in early infancy... ."

On September 8, 1998, the Safety Working Party of the European Agency for the Evaluation of Medicinal Products issued its working paper, "Assessment of the Toxicity of Thimerosal in Relation to Its Use in Medicinal Products." The Working Party concluded:

"There is ample evidence from the literature that thiomersal (thimerosal) may cause sensitization and subsequent allergic reactions ... the use of thimerosal is vaccines given to infants in accordance with various national vaccine programs may in certain cases result in approximately two times higher intake of ethylmercury during the first year of life than what van be considered reasonably safe. Given the great uncertainty of the estimations of safe levels in young children, it is suggested to restrict the use of thimerosal in vaccines.'

In June of 2000, the CDC convened a closed meeting to discuss research evidence that showed a connection between thimerosal in vaccines and neurological injury. Dr. Thomas Verstraeten, a CDC employee who has since left the agency to work in Belgium for a vaccine manufacturer, utilized the Vaccine Safety Datalink to evaluate any possible connection between thimerosal-preserved vaccines and neurological or renal impairment. He found, "a statistically significant positive correlation between the cumulative exposure at 2 months and unspecified developmental delay: the cumulative exposure at 3 months and tics: the cumulative exposure at 6 months and attention deficit disorder. 1, 3 and 6 months and language and speech delay ... 1, 3, and 6 months of age and neurodevelopmental delays in general."

He concludes: "This analysis suggests that in our study population, the risks of tics, ADD, language and speech delays, and developmental delays in general may be increased by exposures to mercury from thimerosal-containing vaccines during the first six months of life."

This issue will be discussed in more detail in another section of this report.

The Committee and the public have been frustrated by the Department of Health and Human Services reluctance to accept that all forms of mercury are toxic and that children have likely been harmed from the FDA's negligence in assuring the safety of thimerosal and in not monitoring the increased exposure to mercury through vaccines.

During the July of 2000 hearing on mercury, Congresswoman Helen Chenoweth-Hage (R-ID) eloquently expressed the views of many.

Mrs. Chenoweth-Hage: "... I have a staffer who is in the Navy Reserve right now, but he used to be active with the airborne divisions, and he was in for a test in one of the medical military hospitals, and upon taking his temperature, they broke a thermometer, and mercury splattered across his glasses and some got in his eye. Well, the first thing they did was cutoff his clothes. The second thing was call in OSHA to clean up the mercury. And then they worked on him to make sure his eyes were irrigated, and you guys, you witnesses, absolutely amaze me. I wonder where the disconnect is, for Pete's sake.

"You listened to the testimony just as I did, and you are willing to, with a straight face, tell us that you are eventually going to phase this out after we know that a small baby's body is slammed with 62 times the amount of mercury that it is supposed to have, and OSHA reacts like they did in the case of this accident of this naval man. It doesn't make sense. No wonder people are losing faith in their government. And to have one of the witnesses tell us it is because mothers eat too much fish? Come on. We expect you to get real. We heard devastating testimony in this hearing today, and we heard it last April. And this is the kind of response we get from our government agencies?

I am sorry. When I was a little girl, my daddy talked to me about something about a duck test. I would ask each one of you to read this very excellent work by Sallie Bernard and Albert Enayati, who testified here today. My daddy used to say if it walks like a duck and talks like a duck and sounds like a duck, for Pete's sake it is a duck.

"I recommend that you read this, side-byside, page after page of analysis of the symptoms of people who are affected with mercury poisoning compared to autism, this is the duck test, and you folks are trying to tell us that you can't take this off the market when 8,000 children are going to be injected tomorrow; 80 children may be coming down, beginning tomorrow, with autism? What if there was an E. coli scare? What if there was a problem with an automobile? The recall would be like that.

"We are asking you to do more than analyze it. We are asking you to tell this body and the American people that it is more inconclusive. It passes the duck test, and we need you to respond. We need that to come off the market now because you think that this is – do you think that we are elevating the case today? Just wait until it gets in the courts. This case could dwarf the tobacco case. And we would expect you to do something now before that circus starts taking place. Denial is not proper right now.

"You know, I still go back to the fact – I still want to talk about the duck test. Mr. Egan, [FDA] I will address this to you. You know, it was shown in the last panel that autistic symptoms emerge after vaccination. It was shown that vaccines contain toxic doses of mercury. It was shown that autism and mercury poisoning, the physiological comparison is striking. There is altered neurotransmitter activity, abnormal brain neuronal organization, immune system disturbance, EEG abnormalities. It goes on and on and on, the comparisons. That is why I say, I back up what the Chairman and the ranking member are all asking you, that we cannot wait until 2001 to have this pulled off.

"You know, if a jury were to look at this, the circumstantial evidence would be overwhelming. Let's do something before we see it in the courts."

In 2003, thimerosal remains in some vaccines.

A. Many parents of autistic children believe that adverse reactions to vaccines are responsible for their children's condition

Based on their personal experiences, many parents believe that the autistic condition of their children is related to an adverse reaction to a childhood vaccine, or a series of vaccinations. This is particularly true of parents of children who have developed "late onset autism," in which symptoms do not begin to emerge until the child is between one and two years old. This time period coincides with a number of vaccinations on the childhood schedule. While this belief is not universal, many parents hold it passionately.

Dr. Jeffrey Bradstreet, when testifying before the Committee in 2001, made the following statement:

"At a recent autism conference in Chicago, and prior to either my own presentation or that of Dr. Wakefield, I asked the audience of 500 parents if they felt their child regressed following a vaccine. In that obviously non-scientific survey, approximately 90 percent the parents raised their hands to affirm vaccines were what they suspected had caused their child's symptoms. When I asked for how many had reported the event under the VAERS system, fewer than 15 said they had. Then I asked if their pediatrician had offered to report this, they just laughed. I have now conducted this simple survey with over 5000 parents at conferences around the world with similar findings. Yes, media attention creates bias. But despite the informal nature of this survey, it does tell us something about this debate we are currently engaged in:

(1) parents of children with autism suspect vaccines damaged their child,
(2) parents are not reporting this using VAERS forms,
(3) pediatricians are not reporting to VAERS either.

(4) and despite efforts by policymakers at CDC, FDA, AAP, IOM and elsewhere to reassure parents of the safety of vaccines, they remain unconvinced."

The Committee has heard moving testimony from parents in support of this belief, as well as from parent-advocates. Shelley Reynolds is a mother of two from Baton Rouge, Louisiana. When she testified before the Committee in April of 2000, her autistic son, Liam, was four years old. Her testimony left no doubt as to her views:

"Liam was a normally developing baby until June 27, 1997, when he received his MMR and Hib vaccines. He did everything he was supposed to do. He cooed, rolled over, crept, crawled, pulled up and walked on time. He said 'Mama,' he said 'Daddy,' he said 'Love you.' He learned how to sing 'Itsy Bitsy Spider. He played finger games with us. He loved to interact, and he especially loved to show off for his grandparents."

* * *

"But when he was 17 months old, shortly after he had received the shots, he started exhibiting some different behaviors. He was constantly taking off his shoes; he screamed if we dressed or undressed him; he would stare for hours in front of the television and would not move if you blocked the view. He could not tolerate playing in the sandbox anymore. He did not want to sing any of his favorite songs; he would cover his ears and scream 'No.™

* * *

"In Liam's case. we have no doubt that he developed his autism as a direct result of an adverse vaccine reaction."

* * *

"Many in the medical community continue to dismiss this as mere happenstance because autism often coincides with the time of vaccination, and state that there is no scientific evidence to back this up. My question to you is:

How long does it take for a coincidence to surface time and time and time again, case after case after case, before it can become a viable hypothesis, especially when the solution to solving the problem seems so apparent?"

At the same hearing, the Committee heard testimony from Jeana Smith of Denham Springs, Louisiana. At the time, she was the mother of five-year-old twins, one of whom was autistic. Her testimony made equally clear her conviction that her son's autism was related to a series of vaccinations given on the same day:

"Jacob met every developmental milestone that first year, right along with Jesse. They were two little peas in a pod and went everywhere together. At only1 6 months of age, Jacob and Jesse received their first MMR vaccine. On this same day, they also received their fourth DTP, their fourth Hib, and their third hepatitis B. The following 24 hours, both twins slept most of the time, with over 100-degree temperatures, in spite of receiving the recommended Tylenol dosage every 6 hours.

Immediately following that, Jacob began exhibiting strange behaviors. He was no longer excited or responsive when Daddy would come home from work. He began to become preoccupied with certain toys. He would spend long periods of time studying the way their wheels would spin or whether or not they were lined up just right. Any attempt to interrupt or distract him was met with great resistance and an eventual fit. During this time, Jesse continued to progress, starting to talk and interact with all the children around him."

* * *

"At times, Jacob was so withdrawn that we could absolutely not reach him."

* * *

"For us, there is no denying that in Jacob's case of autism, the answer does not lie in genetics, but in a catalyst. The thousands of hours of research that we have spent searching and retracing his regression continue to point to the fact that the road of Jacob's autism began when his immune system was damaged by the hepatitis B vaccine he received when he was ill. The final blow was the adverse reaction to the host of vaccines he received 16 months later. We are certain that for Jacob, the catalyst was his vaccine."

Testifying two years later, on April 18, 2002, Autism Society of America President Lee Grossman testified about the strongly held views of many of the Society's members:

"A substantial number of families within our autism community believe some forms of autism may be caused by some use of vaccines. While we do not know this to be specifically proved at this time, we should not ignore the body of evidence that calls into question the source of many children with autism. If causation is found, those injured must be provided recourse and compensation."

* * *

"I think the stories that I have heard that many of our members tell. that many of these people in the audience will tell you, is that they believe that there is evidence that there is a direct linkage. a direct causation of vaccines causing their child's autism. I think it is imperative for us, the advocates in the room, for ASA, and for Congress, for the lay public, to stand together to get this question answered, answered immediately."

B. Many parents of autistic children have filed petitions for compensation or lawsuits against vaccine manufacturers

Not surprisingly, suspicions that there may be a causal relationship between some vaccines and autism have spawned a significant amount of litigation.

As of October 2002, more than 875 families had filed petitions for compensation under the Federal Vaccine Injury Compensation Program (VICP), alleging that a vaccine or a series of vaccines caused their child's autism. It has been estimated that as many as 3,000 to 5,000 such petitions may be filed in the near future.

...

VL. A growing number of Scientists and Doctors believe that a Relationship between Thimerosal in Vaccines and Autism spectrum disorders is plausible

A. *Introduction*

A growing number of respected scientists and researchers are convinced that there is a relationship between the use of thimerosal in childhood vaccines and the growing incidence of autism. A number of these scientists have testified before the Committee. At the same time. senior officials from Federal health care agencies and other public health experts continue to insist that there is no evidence of such a relationship.

Two things appear to be clear in this debate:

First, concerns about the use of thimerosal in vaccines existed in public health agencies for more than two decades before action was taken to remove them from vaccines. The lethargic response to these legitimate concerns will be discussed in the following section of this report.

Second, much more research needs to be done before any conclusive determinations can be made about vaccines and autism spectrum disorders. Developing more and better research data will be critically important to resolving the legal disputes over compensation for children with autism, and restoring the confidence of the American public in vaccines.

This section will review the current state of the scientific debate over vaccines and autism.

B. *Institute of Medicine reports call for more research*

In 2001. the Institute of Medicine (IOM) released two reports after reviewing the evidence they received related to possible connections between vaccines and autism. The IOM was created by the National Academy of Sciences in 1970 to conduct independent analyses of public policy matters related to health care. The first report dealt with the MMR vaccine. The second dealt with vaccines containing thimerosal. The common thread linking both reports was the conclusion that much more research needed to be done before firm conclusions could be drawn.

In April of 2001, the IOM issued its report on the MMR vaccine, entitled, "Immunization Safety Review – Measles-Mumps-Rubella Vaccine and Autism." After reviewing the available scientific studies, the IOM determined that: "The evidence favors rejection of a causal relationship at the population level between MMR vaccine and autism spectrum disorders."

The IOM stated that the epidemiological evidence available at the time showed no association at a population level between the MMR vaccine and autism. However, the authors cautioned that if the vaccine triggered autistic disorders among a small number of children who were predisposed to an adverse reaction, the population studies that had been done to-date would be too imprecise to detect them:

"It is important to recognize the inherent methodological limitations of such studies in establishing causality. Studies may not have sufficient precision to detect very rare occurrences on a population level. A poor understanding of the risk factors and failure to use a standard case definition may also hamper the ability of epidemiological studies to detect rare adverse events."

The IOM recommended further research to determine if exposure to the MMR vaccine is a risk factor for autism disorders in a small number of children. They also called for targeted studies to follow up on a groundbreaking series of case studies by Dr. Andrew Wakefield of Great Britain, who determined that 12 British children who suffered from autism spectrum disorders and chronic bowel inflammation also had vaccine-strain measles virus in their tissues. Although the parents of eight of the twelve children traced the onset of autistic symptoms to the time period when the MMR vaccination was given, the IOM stated that the study was of limited utility because of its small sample size."

Six months later, the IOM issued its second report, entitled, "Immunization Safety Review – Thimerosal-Containing Vaccines and Neurodevelopmental Disorders." They found insufficient evidence to accept or reject a connection between thimerosal in vaccines and autism. They did. however, state that such a connection is "biologically plausible," and recommended much more research on the issue.

The report summarized: "The committee concludes that although the hypothesis that exposure to thimerosalcontaining vaccines could be associated with neurodevelopmental disorders is not established and rests on indirect and incomplete information, primarily from analogies with methylmercury and levels of maximum mercury exposure from vaccines given in children, the hypothesis is biologically plausible."

* * *

"The committee concludes that the evidence is inadequate to accept or reject a causal relationship between exposure to thimerosal from vaccines and the neurodevelopmental disorders of autism, ADHD, and speech or language delay."

The IOM noted that it had reviewed the results of one unpublished epidemiological study that detected a "statistically significant but weak association" between exposure to thimerosal-containing vaccines and several types of developmental disorders, including attention deficit disorder, speech and language delay, tics, and general neurodevelopmental delays.

Phase I of the study, which was performed with data from the CDC's Vaccine Safety Datalink, (VSD) uncovered the aforementioned associations.

Phase II of the study, which provided enough data to analyze only speech delays and attention deficit disorder, did not detect an association between those disorders and thimerosal, as had Phase I. After being briefed on both phases of the study, the IOM's Immunization Safety Review Committee agreed that they were inconclusive. The "VSD Study" is discussed at greater length in Section VII.

The IOM also noted with some discomfort that thimerosal had not been removed from all vaccines and medicines given to children and pregnant women. The report specifically cited the influenza vaccine, the diphtheriatetanus toxoid vaccine, and some nasal sprays. They urged that, "full consideration be given by appropriate professional societies and government agencies to removing thimerosal from vaccines administered to infants, children or pregnant women in the

United States." It was also recommended that any remaining stocks of childhood vaccines containing mercury be removed from doctor's offices and replaced with mercuryfree alternatives.

Finally, the report recommended that numerous types of research be conducted to help the scientific community better determine if there is a causal relationship between thimerosal and autism or other disorders. The IOM called for:

Case-control studies examining the potential link between neurodevelopmental disorders and thimerosal-containing vaccines;

Further analysis of cohorts of children who did not receive thimerosal-containing doses of vaccines during clinical trials;

Epidemiological studies comparing the prevalence of neurological disorders in children, who received vaccines before thimerosal was removed, to children who received vaccines after it was removed:

An increased effort to identify the primary sources and levels of prenatal and postnatal exposure to thimerosal;

Clinical research on how children metabolize and excrete metals;

Theoretical modeling of ethylmercury exposures, including the incremental burden of thimerosal on background mercury exposures from other sources;

Research in appropriate animal models on neurodevelopmental effects of ethylmercury;

Rigorous scientific investigations of chelation as a treatment for neurodevelopmental disorders; and

Research to identify a safe, effective and inexpensive alternative to thimerosal for countries that decide they want to follow the example of Europe and the United States and terminate its use in vaccines.

C. *A growing Number of Researchers believe that there may be a relationship between Vaccines and Autism spectrum disorders*

A growing number of researchers and medical professionals believe that there may be a link between the mercury preservative used in vaccines and autism spectrum disorders and other neurodevelopmental disorders. Few, if any, would make such a statement categorically until more research is done. However, judging by testimony received by the Committee, many researchers believe that this hypothesis is plausible based on work they have done to-date. They believe that this is a promising field of research that may yield breakthroughs on the question of the underlying causes of the growing incidence of autism and other neurodevelopmental disorders.

On April 25, 2001, the Committee heard testimony from Dr. *Boyd E. Haley*, who is the Chairman of the Chemistry Department at the University of Kentucky. Dr. Haley has spent many years studying the effects of mercury on the human body. Dr. Haley summarized his views in this way:

"I cannot say, nor would I say, that vaccinations cause autism. However, if the data holds up that I have been seeing with the relationship, I think it is an awfully good suspect, at least one of the co-factors that might aid in the onset of this disease. So I would really recommend and encourage you to put some pressure on the National Institutes of Health (NIH) to look at the contribution of different forms of mercury we put in our medicines and in our dentistry to see what effect they have on the neurological health of Americans."

In his testimony, Dr. Haley described his laboratory research on thimerosal:

"I was requested to do an evaluation of the potential toxicity of vaccines containing thimerosal as a "preservative" versus those vaccines not containing thimerosal. The results were very dramatic as shown in the accompanying Table attached to this document. In our preliminary studies, vaccines containing thimerosal as a preservative consistently demonstrated in-vitro toxicity that was dramatically greater than the non-thimerosal or low-thimerosal containing vaccines."

* * *

"Our results are very consistent with the reported toxicity of thimerosal-containing vaccines versus non-thimerosal containing vaccines as observed in cell culture studies reported in 1986. The

chemical rationale for the neurotoxicity of thimerosal is that this compound would release ethyl-mercury as one of its breakdown products. Ethyl-mercury is a well-known neurotoxin. Further, combining thimerosal with millimolar levels of aluminum cation plus significant levels of formaldehyde, also found in these vaccines, would make the vaccine mixture of even greater risk as a neurotoxic mixture."

Dr. Haley went on to state that infants are more susceptible to damage from mercury, because the defense mechanisms in their bodies are less well developed:

"Infants, with their immature physiology and metabolism, would not be expected to handle mercury as efficiently as mature adults."

* * *

"Using this vaccine mixture on infants, who do not have fully developed bilary (liver) and renal (kidney) systems, could dramatically increase the toxic effects, especially if they are spuriously ill. The toxic effects of exposure to thimerosal in infants cannot be reasonably compared to those observed in adults made toxic by exposure to similar ethyl-mercury containing compounds. Mercury is primarily removed through the bilary system and aluminum is removed by the renal system. Inability to rid the body of these toxicants would greatly increase the damage they are capable of doing in infants."

Dr. Haley's concerns about the inability of infants to fend off the adverse effects of mercury were echoed by *Dr. David Baskin*. Dr. Baskin is a neurosurgeon and a professor of neurosurgery and anesthesiology at Baylor College of Medicine. He has been involved in extensive research on the central nervous system and serves on scientific advisory boards of the National Institutes of Health.

Testifying before the Committee in December of 2002, Dr. Baskin said:

"We clearly know infants' brains are more sensitive. We know the blood-brain barrier, the barrier to drugs between the blood and the brain, is virtually gone in infants."

Virtually all researchers who have testified before the committee have hypothesized that some children must have a genetic predisposition that makes them more vulnerable to neurological damage from mercury.

An exchange between Congressman Burton and Dr. Baskin at the December 10, 2002, hearing reflected this emerging consensus:

Mr. *Burton*: "Do you personally believe from your studies that the mercury is a contributing factor to the cases of autism we have in this country?

Dr. *Baskin*: "Yes."

Mr. *Burton*: "Do you think it's a large contributing factor, or do you have any percentages? I mean. I know this is a tough question and everything, but you have done a lot of research."

Dr. *Baskin*: "I think it's hard to look at a percentage, I think that as NIH is focusing on, there is probably an environment-gene interaction. In other words, a lot of children get the injection and don't become autistic, and so there must be something specific or different about the way a certain subgroup of children are able to handle toxins. ... I don't think we yet know the answer to that."

In his testimony the previous year, Dr. Haley of the University of Kentucky described one possible genetic risk factor. He stated that there is a protein in the brain called APO-E that removes dangerous waste materials from the brain. He added that some individuals are born with a variety of this protein that is very efficient at removing mercury, and some individuals are born with a variety of this protein that is very inefficient at removing mercury:

"If you look at the chemistry of the APO-E proteins, this can be reflected in the fact that it is a housekeeping protein that clears the brain of waste materials. If you have APO-E2, you can carry out two atoms of mercury for every atom of APO-E that goes out. If you have APO-E4, you can carry out none.

"He (*Dr. Mike Godfrey* of New Zealand] took this and looked at autistic children. When he did the screen of autistic children, there was a huge preponderance of them that had APO-E4, indicating

that there is a genetic risk factor, which deserves further study. And it does imply that the inability to detoxify the cerebral spinal fluid may be at least part of the neurological aspect of this disease."

Dr. Baskin described research he is conducting which demonstrates what the effects of mercury are when it is not removed from brain tissue:

"Let me turn to some studies that we're doing at Baylor College of Medicine. We have the opportunity to actually grow human frontal cortex cells in cell culture. So these are cells from the front part of the brain that grow in culture. We incubate these cells with thimerosal at various doses, and we use a number of very sophisticated techniques to detect cell death and cell damage."

* * *

"Here are some pictures from our cell culture experience, and you can see the arrows pointing to those little knobs sticking off the cell. These are the cells committing the suicide program and breaking themselves into tiny little pieces with a very low dose of mercury."

"Here is a slide where you see a lot of blue cells. This is a blue dye that normal cells don't take up. In order for something to turn blue, the cell has to have holes punched in their membranes. And guess what: At an extraordinarily low dose of thimerosal, most of the cells are blue. It means that this stuff grabs a hold of the membrane and punches holes into it, so that the dye can penetrate, not only into the cytoplasm but into the very center of the cell, the nucleus, where all the DNA exists."

* * *

"Don't forget, we did this in adult brain cells. Remember that infant brain cells are much more sensitive, so there's a real cause for concern.'

Dr. Baskin testified that other researchers in his field are finding similar results:

"At the recent International Meeting for Autism Research at the Society for Neuroscience, a number of investigators around the world are finding similar things. At Columbia University, there's now a model in mice who were injected with low doses of thimerosal very similar to what's given in human vaccines. These mice develop neurological deficits that look like autism, and when you take their brains out and you analyze them, they have the same type of brain damage."

D. *Public health officials continue to defend the use of thimerosal in vaccines*

Public health officials continue to resist the idea that thimerosal may have contributed to the growth in autism spectrum disorders. In public statements as recently as December of 2002, Federal officials have continued to defend the use of thimerosal, despite the fact that:

They asked vaccine manufacturers to remove thimerosal from childhood vaccines more than three years ago:

In the 1990's, they acknowledged that many children received a cumulative amount of ethylmercury in vaccines that exceeded the EPA's safe limits for methylmercury:

One Federally sponsored study showed an association between thimerosal in vaccines and some developmental disorders.

On April 18, 2002. the Committee heard testimony from *Melinda Wharton*, Director of the Epidemiology and Surveillance Division of the CDC's National Immunization Program. Her response to a question about mercury in vaccines hinted at the skeptical attitude that prevails at the CDC and the FDA:

"As far as the thimerosal issue is concerned, the evidence is too incomplete and fragmentary to make any decisions about causation. Of course, many substances are known to be dangerous when administered in high concentrations, but the additives that are included in vaccines are present in trace amounts, and even when multiple vaccines are given, these are still very small amounts of products. It is not established even that thimerosal is associated with any harm as a vaccine additive.

"That said, we have committed a large amount of staff time and funding to try to further elaborate these issues and have designed a whole series of studies that have been described in our written testimony that we believe will help address these issues."

She further stated:

"There are not data to – there are no established harms associated with this. I know this is a subject of great concern, and a number of studies are underway, but we do not have data that support known hazards associated with thimerosal contained in vaccines at this point."

Later in 2002, *Dr. Karen Midthun*, Director of the FDA's Office of Vaccines Research and Review, expressed almost identical views:

"Our review showed no evidence of harm caused by thimerosal used as a preservative in vaccines except for local hypersensitivity reactions."

* * *

"To date, the existing data do not demonstrate a causal relationship between vaccines and autism. Nonetheless, I want to assure this committee, the public, and especially parents, that the FDA continues to take these issues seriously."

In her testimony, Dr. Midthun attempted to downplay the extent to which the exposure to ethylmercury from vaccines in the 1990s exceeded the EPA's threshold for methylmercury exposure:

"During the first 6 months of life cumulative exposure to mercury could have exceeded the more conservative limits of the EPA in some cases, depending on the specific vaccine formulations used and the weight of the infant."

There is no question that the cumulative amount of ethylmercury on the recommended schedule of childhood vaccinations exceeded the EPA's threshold for methylmercury. In fact, there is little doubt that the amount of ethylmercury in individual vaccines exceeded the threshold. The EPA's threshold is 0.1 micrograms per kilogram of body weight. For an eleven-pound baby. the EPA's safe threshold would be 0.5 micrograms. Although thimerosal has been removed from these vaccines today in the United States, in the 1990°s, Aventis Pasteur's DTaP vaccine contained 25 micrograms of thimerosal. Glaxo-SmithKline's Hepatitis B vaccine contained 12.5 micrograms of thimerosal. Wyeth Lederle's Hib vaccine contained 25 micrograms of thimerosal.

Dr. Midthun's carefully couched statement suggested that there were many instances in which U.S. infants were exposed to cumulative levels of ethylmercury from their vaccines that were significantly lower than the EPA threshold for methylmercury. In the 1990's, at least, this does not appear to have been the case. It is clear that the DTaP. Hepatitis B and Hib vaccines exceeded the EPA's threshold individually for almost all infants, without even considering cumulative amounts. In fact, as will be discussed in the next section of this report, the amount of ethylmercury in these vaccines also exceeded the FDA's higher threshold of 0.4 micrograms per kilogram for most babies.

One vaccine policymaker, who was at least partially swayed by the Faroe Islands studies and other evidence, was *Dr. Neal Halsey*, Director of the Institute of Vaccine Safety at Johns Hopkins University. Dr. Halsey was an influential member of Federal advisory committees that oversaw the expansion of the Federally recommended schedule of childhood vaccines in the 1990s. By all accounts, Dr. Halsey was instrumental in the decision to seek the removal of Thimerosal from childhood vaccines in 1999.

In contrast to Dr. Midthun's statements, Dr. Halsey told the New York Times that he was astonished when he reviewed an FDA analysis of how much mercury was in vaccines being given to children:

"My first reaction was simply disbelief, which was the reaction of almost everybody involved in vaccines. In most vaccine containers, thimerosal is listed as a mercury derivative, a hundredth of a percent. And what I believed, and what everybody else believed, was that it was truly a trace, a

biologically insignificant amount. My honest belief is that if the labels had had the mercury content in micrograms, this' would have been uncovered years ago. But the fact is, no one did the calculation."

"My first concern was that it would harm the credibility of the immunization program, But gradually it came home to me that maybe there was some real risk to the children."

In a statement released by Johns Hopkins University after the publication of the profile in the New York Times, Dr. Halsey clarified that he still does not believe that there is a connection between thimerosal and autism:

"Neal Halsey, MD, ... does not and has not supported the belief that thimerosal or vaccines themselves cause autism in children, saying scientific evidence does not suggest any causal association between any vaccine and autism."

However, Dr. Halsey's statement made it equally clear that he believes that there may be an association between exposures to low levels of mercury and other neurological impairments. His statement referred specifically to the Faroe Islands studies and the calculation that the cumulative amount of thimerosal in childhood vaccines exceeded the EPA's limits for methylmercury:

"In 1999, Dr. Halsey became concerned that the use of thimerosal as a preservative in many vaccines led to some children being exposed to more ethylmercury than was recommended, based on guidelines from the Environmental Protection Agency for exposure to methylmercury, a related product. Recent studies have determined that children who as fetuses were exposed to low to moderate amounts of methylmercury through fish consumed by their mothers were at an increased risk for having mild neurological learning deficiencies. The findings from the studies did not show an association between methylmercury exposure and autism."

* * *

"As a precaution and in an effort to make vaccines as safe as possible, Dr. Halsey worked with the American Academy of Pediatrics and the Public Health Service in 1999 to urge reductions in exposure to mercury, in all its forms, for infants and children, and to discontinue using thimerosal as a preservative whenever possible."

E. *Research on the effects of thimerosal has been too limited to draw conclusions*

To date, very little epidemiological or clinical research has been done on the neurological effects of thimerosal, and particularly its ethyl-mercury component. As the IOM noted in its report on thimerosal, "the data regarding toxicity of low doses of thimerosal and ethylmercury are very limited," and most of the conclusions that have been drawn about ethylmercury are based on analogies to methylmercury, which has been more widely studied. The few studies that have been performed on ethylmercury have been of limited value, for several reasons.

Perhaps *Dr. Thomas Verstraeten* conducted the broadest review of a possible relationship between thimerosal and neurological disorders in 2000. This study reviewed several years of medical records from the Vaccine Safety Datalink maintained by the CDC. As noted earlier, Phase I of this study purported to find a statistically significant association between exposure to thimerosal and some neurological disorders. However, this study has never been published. Moreover, because the data used in the study comes from the Vaccine Safety Datalink, and because the medical records in this database are jealously guarded by the CDC, the data used in this study has never been made public. It is discussed at greater length in the next section of this report.

In November of 2002, a study on thimerosal conducted at the University of Rochester was published in The Lancet, Great Britain's premiere medical journal. The authors studied 40 children who were given vaccines containing thimerosal, and 21 children who were given vaccines without thimerosal. Samples of blood, stools and urine were obtained from 3 to 28 days after vaccination to determine how much mercury remained in the blood and how much was expelled in the urine and in stools.

The authors found low levels of mercury in the blood of infants exposed to thimerosal, and high levels of mercury in their stools, indicating to them that ethylmercury has a shorter half life then methylmercury, and that most of the mercury was excreted through the gastro-intestinal tract.

According to the authors:

"We have shown that very low concentrations of blood mercury can be detected in infants aged 2-6 months who have been given vaccines containing thiomersal [sic]. However, no children had a concentration of blood mercury exceeding 29. . . parts per billion, which is the concentration thought to be safe in cord blood."

The authors went on to conclude:

"Overall, the results of this study show that amounts of mercury in the blood of infants receiving vaccines formulated with thiomersal [sic] are well below concentrations potentially associated with toxic effects. Coupled with 60 years of experience with administration of thiomersal-containing vaccines, we conclude that the thiomersal in routine vaccines poses very little risk to full-term infants, but that thiomersal-containing vaccines should not be administered at birth to very low birth weight, premature infants."

Skeptics of a vaccine-autism connection hailed this study. However, its value is limited by a number of criticisms that have been raised since its publication. Some of the most commonly cited shortcomings were discussed in testimony at the Committee's December 10. 2002, hearing by Baylor University's Dr. Baskin.

1. *The sample size* was very small:

Only 40 children who received thimerosal were studied. If a small number of children were genetically predisposed to injury by mercury, the chances of a sample of 40 children detecting such a trend would be very low.

In his testimony, Dr. Baskin stated: "The sample size, as you said, Dr. Weldon, was small. Autism occurs in one in 150 kids. So if a child had some different tendency in their blood to absorb more mercury or have it remain in the blood longer or be more sensitive in their brain, if they only checked 40 kids, they may well not have found even one kid with a predisposition to autism."

2. *The sample* was not random:

In his testimony, Dr. Baskin commented on the importance of a random sample size: "The sample wasn't random. They didn't take kids from different portions of the population in different areas. If there's some metabolic difference based on race or sex or where you live or other things, they wouldn't have found it."

3. *Blood samples* were drawn too late to detect peak levels of mercury:

In an effort to determine how long it takes ethylmercury to be expelled from an infant's body, and what the expected half-life of injected ethylmercury is, the authors drew blood from their subjects at varying times between three and 28 days after shots were administered. However, as Dr. Baskin notes, peak levels of mercury in the blood are expected to appear within 24 hours:

"We know the stool levels were high, but if you look at when they actually measured the blood levels, they said it was somewhere between 3 and 27 days later. The peak mercury levels after injection occur within hours or at least within the first 24 hours. So if they were drawing blood later than that, and much later than that, of course the levels weren't going to be high. But the mercury doesn't jump from the injection to the stool; it goes through the blood. At some point it was high because it was high in the stool."

* * *

"You can't do a pharmacokinetic study if you don't have the peak level. They clearly didn't have the peak level because they have high stool mercury, and they have low blood mercury—it doesn't make sense."

4. *The study did not measure* the effects of mercury on infants, only the levels of mercury:

While the University of Rochester study measured the levels of mercury in infants' bodies at various times beyond peak levels. it did not attempt to determine the effects of the mercury on their bodies. This limitation was Clearly brought out in an exchange between Congressman Burton and Dr. Christopher Portier, Director of the Environmental Toxicology Program at the National Institute of Environmental Health Sciences:

Mr. Burton: "Does the study recently published in The Lancet identify the effects of mercury on infants who are vaccinated with thimerosal?"

Dr. Portier: "No."

Given the small sample size, the failure to measure mercury at peak levels, and the study's inability to measure the effects of the ethylmercury present in the bodies of the subjects, it is difficult to understand how the authors can come to the broad conclusion that, "the thimerosal in routine vaccines poses very little risk to full-term infants."

If anything, the limitations of this study point out the need for much more research to be done. As Dr. Baskin pointed out:

"They described this as a descriptive study, and that's exactly what it was. It provides some interesting information, it's a start, but the interpretation is inaccurate."

VII. *Evidence of ethyl mercury's toxicity was neglected by manufacturers and federal regulators for years*

A. *Introduction*

Evidence of ethylmercury's toxicity was available to Federal regulators and the private sector almost from the product's inception. For far too long, both neglected this evidence. Despite evidence dating to the 1930s that ethylmercury in medicines was potentially hazardous, little was done to remove it from a number of products until the 1980's. Even then, regulatory actions to remove thimerosal and other mercury compounds from medical products proceeded at a glacial pace. The decision to remove thimerosal from topical ointments was not finalized until 1998. The removal of thimerosal from several childhood vaccines in the United States wasn't accomplished until after the turn of the century. Today, the vaccine for influenza given to infants still contains trace amounts of ethylmercury.

For decades, ethylmercury was used as a preservative or anti-bacterial agent in a range of products, including antiseptic ointments for treating cuts, nasal sprays, eye solutions, diaper rash treatments, contraceptive products, and perhaps most importantly, vaccines. Several years after an FDA advisory committee found that thimerosal wasn't safe for use in topical ointments, new childhood vaccines containing thimerosal were being approved and added to the recommended schedule. It appears that nobody analyzed the potential impact of the increased cumulative amount of mercury to which young children were being exposed. In fact, if Congress had not enacted legislation in 1997 requiring the FDA to study the amounts of mercury being used in FDA-approved products, it is questionable that the FDA would have analyzed mercury in vaccines at all.

It is no wonder that, in its report on thimerosal, the Institute of Medicine commented:

"The presence of mercury in some vaccines can raise doubts about the entire system of ensuring vaccine safety, and late recognition of the potential risk of thimerosal in vaccines may contribute to a perception among some that careful attention to vaccine components has been lacking."

It is clear that the guiding principal for FDA policymakers has been to avoid shaking the public's confidence in the safety of vaccines. For this reason, many FDA officials have stubbornly denied that thimerosal may cause adverse reactions. Ironically, the FDA's unwillingness to address this issue more forcefully, and remove thimerosal from vaccines earlier, may have done more long term damage to the public's trust in vaccines than confronting the problem head-on. Given the serious concerns about the safety of thimerosal, the FDA should have acted years earlier to remove this preservative from vaccines and other medicines.

B. Thimerosal manufacturers accumulated evidence of the toxicity of thimerosal

Eli Lilly and Company of Indianapolis licensed thimerosal in 1930. It was marketed under the brand name "Merthiolate." It was used extensively both in topical ointments to prevent infections and as a preservative in a variety of medicines. However, it now appears that very little research on the safety or effectiveness of thimerosal was ever done.

Eli Lilly was not the only manufacturer of thimerosal or other ethylmercury products. In fact, they phased out their production of thimerosal in 1974. However, Eli Lilly initially patented this product and had a longer history with it than any other company. Therefore, it is appropriate to review Lilly's track record in ensuring the safety and reliability of this product.

A review of internal Eli Lilly documents dating back 70 years suggests that the only study of thimerosal involving human subjects was done prior to 1930. For the next seven decades, Lilly spokespeople would refer to that original study as evidence of thimerosal's safety. However. it is now clear that this uncontrolled study was woefully inadequate.

As previously discussed in this study, an intravenous solution containing thimerosal was tried as an experimental treatment for 22 men who were seriously ill with Meningitis. While the treatment was found to be ineffective, the doctor who conducted the study concluded that the solution caused no harmful side effects. It is clear today that such a limited number of subjects, all suffering from the same serious illness, would hardly qualify as a sufficiently sized random sample, and a study such as this one would be of very little value by today's standards. In fact, an internal Eli Lilly memo from 1972 candidly notes the study's shortcomings:

"Considering the type of patient involved, one might question these observations (the appearance of no deleterious action) as providing adequate indication of any harmful effects of high doses of Merthiolate in humans, in particular, more long term effects."

In 1973, the FDA requested additional data on Merthiolate from Eli Lilly. Lilly's Director of Regulatory Affairs, E.A. Burrows, responded with a ringing defense of Lilly's product on February 14, 1973:

"Due to the length of time this product has been on the market, its efficacy and safety have been proven by over forty years of use throughout the world. Because of this long period of use, it would be difficult to get recognized researchers to conduct new studies for safety or efficacy. They believe that over forty years of wide usage has proven efficacy and safety beyond that which could be done in special studies."

Despite Mr. Burrow's contention, numerous internal Lilly documents recognized the lack of data on thimerosal and suggested the need for more research:

An April 24, 1930, intra-office memo stated: "... in view of our experience with the merthiolate solution. we have to know pretty definitely what to expect from merthiolate ointment and jelly before they are put on the market .... Can we expect to have the stronger ointment and jelly used without complaint which attended the use of the solution in the same strengths? ... Our experience with the solution ought to serve as a warning and certainly in the face of that warning we ought not to advocate the use of the stronger products without some pretty definite evidence that we will not repeat our solution experience."

A September 1934, paper from Lilly's files states:

"Little is known about the effect of mercuric compounds when inoculated into humans. It is therefore preferable to use the minimum amount of this preservative necessary to maintain the sterility of the product."

An April 1969, memo regarding the possible use of thimerosal in contact lens solution states:

"When Merthiolate breaks down, are the degradation products toxic or irritating? Our files yield no test information on the irritancy of degraded merthiolate."

* * *

"Would we recommend the use of merthiolate solution to store and sterilize contact lenses? In the absence of appropriate data, a positive recommendation could not be made, this use does not seem unreasonable and probably would not be hazardous."

A December 1972, memo states: "A review of some data being generated by the current concern for mercury in the environment suggests it would be advisable to obtain data on the metabolic deposition of Merthiolate...

An August 1973, memo entitled, "Merthiolate Toxicity," acknowledged: "The effects of long-term, intravenous use in man is not known, no long-term toxicity tests have been performed."

Perhaps more disturbing is that Lilly's files contained numerous papers and reports documenting the toxicity and hypersensitivity of Merthiolate. Although these papers and case reports strongly suggested the need for much more research, there apparently was little follow-up.

A July 1935, letter from the Pittman-Moore Company indicated that Merthiolate was not appropriate for use in dogs:

"We have obtained marked local reaction in about 50% of the dogs injected with serum containing dilutions of Merthiolate. varying in 1 in 40,000 to 1 in 5,000, and we have demonstrated conclusively that there is no connection between the lot of serum and the reaction. In other words, Merthiolate is unsatisfactory as a preservative for serum intended for use on dogs. Occasional dogs do not show the local reaction, but in some instances, the reaction is extremely severe. I might say that we have tested Merthiolate on humans and find that it gives a more marked local reaction than does phenol or thimerosal."

A 1947 paper published by an Army physician in Baltimore reported that Merthiolate was causing contact dermatitis in his patients. He concluded:

"No eruptions or reactions have been observed or reported to Merthiolate internally, but it may be dangerous to inject a serum containing Merthiolate into a patient sensitive to Merthiolate."

A 1948 paper from an Arizona doctor reported the case of a woman who suffered repeated multiple reactions to Merthiolate applied to her skin prior to surgery. She reportedly suffered chills and fevers and had small vesicles and erythema in the area of her Merthiolate application. After her recovery, the patient indicated that the ulcer for which she was being surgically treated appeared after repeated application of a tincture of Merthiolate. She continued applying the Merthiolate until her skin became too raw and painful to continue use, and then sought medical care.

A 1950 New York Academy of Sciences article entitled, "Mercurials as Antiseptics," found that Merthiolate "is toxic when injected parenterally and therefore cannot be used in chemotherapy."

A 1973 article, entitled, "Dangers of Skin Burns from Thimerosal," reported the case of a woman who received severe burns resulting from a chemical interaction between thimerosal and aluminum. The article suggested that thimerosal and aluminum should not be used together. Later in 1973, Lilly's legal department recommended new labeling language for thimerosal products: "Do not use when aluminum may come in contact with treated skin." Unfortunately, thimerosal and aluminum were used together in the DTP and DTaP vaccines for years.

C. The FDA was painfully slow to require the removal of mercury from over-the-counter (OTC) products.

In 1974, the FDA undertook a comprehensive review of the safety and effectiveness of over-the-counter medicines. As one facet of this review, a panel of experts was assembled to review the safety and efficacy of over-the-counter drugs containing mercury. The Advisory Review Panel on OTC Miscellaneous External Drug Products began this review in 1975. In 1980, the panel delivered its report to the FDA. It reviewed 18 products containing mercury, and found them all either unsafe or ineffective for their stated purpose of killing bacteria to prevent infections.

In terms of effectiveness, the panel stated that, "mercury compounds as a class are of dubious value for anti-microbial use." They stated that, "mercury inhibits the growth of bacteria, but does

not act swiftly to kill them." In fact, the panel cited a 1935 study of the effectiveness of thimerosal in killing staphylococcus bacteria on chick heart tissue. The study determined that thimerosal was 35 times more toxic to the heart tissue it was meant to protect than the bacteria it was meant to kill.

In terms of safety, the panel cited a number of studies demonstrating the highly allergenic nature of thimerosal and related organic mercury products. For instance, they cited a Swedish study that showed that 10 percent of school children, 16 percent of military recruits, 18 percent of twins, and 26 percent of medical students had hypersensitivity to thimerosal. They stated that while organic mercury compounds like thimerosal were initially developed to decrease the toxicity of the mercury ion, thimerosal was actually found to be more toxic than bichloride of mercury for certain human cells.

By way of summary, they stated the following:
"The Panel concludes that thimerosal is not safe for OTC topical use because of its potential for cell damage if applied to broken skin, and its allergy potential. It is not effective as a topical antimicrobial because its bacteriostatic action can be reversed."

Despite the fact that the expert committee found thimerosal and other ethyl-mercury compounds unsafe and ineffective for over-the-counter products, the FDA would not formally require the removal of mercury from these products for another 18 years. The submission of the committee's report in 1980 set in motion a tortuous bureaucratic process that would not result in the banning of mercury from over-the-counter products until 1998. The agency published Advanced Notice of Proposed Rules or Notice of Proposed Rules regarding these products in 1980, 1982, 1990, 1991, 1994 and 1995.

What makes the glacial pace of these proceedings all the more mystifying is that there appears to have been no opposition to this action throughout the process. No individuals sought to appear before the advisory committee in defense of mercury-containing products, and when the FDA sought public comment along the way on proposed rules to ban certain mercury-based products, it received none. At the time of the FDA's final action, there were 20 over-the-counter products containing mercury being marketed by eight different manufacturers. Their silence on this point is telling.

D. The FDA's actions to remove mercury from over-the-counter products should have prompted a review of mercury in vaccines

It is difficult to understand why it took the FDA 18 years to remove mercury from over-the-counter products. It is equally difficult to understand why the expert panel's 1980 findings on thimerosal’s safety in topical ointments did not prompt the FDA to further and immediately review the use of thimerosal in vaccines. Surely there must have been concern that if it was not safe to apply ethylmercury to the surface of an individual’s skin, it might not be safe to inject ethylmercury deep into an infant's tissue. The Director of the FDA's National Center expressed such a concern at a 1999 meeting for Toxicological Research, *Dr. Bernard Schwetz*, who went on to serve as the Acting Director of the FDA for nearly a year:

"One thing I haven't heard discussed, the fact that we know that ethylmercury is a skin sensitizer when it’s put on the skin, and now we're injecting this IM (intramuscularly) at a time when the immune system is just developing, the functionality of the immune system is just being set at this age. So now we're injecting a sensitizer several times. During that period of time, what's the impact of a sensitizer – of something that is known to be a skin sensitizer, what is the effect on the functional development of the immune system when you give a chemical of that kind repeatedly IM?"

Different branches of the FDA regulate over-the-counter products and vaccines. OTCs are regulated by the Center for Drug Evaluation and Research (CDER). Vaccines are regulated by the Center for Biologics Evaluation and Research (CBER). This, however, is little justification for the lack of coordination. The FDA’s determination that mercury was unsafe and should be removed

from over-the-counter medications was published in the Federal Register no fewer than five times prior to the FDA‘s belated review of mercury in vaccines.

What finally prompted the FDA to review mercury in vaccines was not its own regulatory process, but rather an act of Congress. In 1997, Congress passed and the President signed into law, the Food and Drug Administration Modernization Act (FDAMA). Among other things, this law required the FDA to compile a list of foods and drugs that contained intentionally-introduced mercury, study its effects on the human body, and restrict its use if found to be harmful.

E. Federal regulators moved too slowly to remove thimerosal from vaccines

Once the FDA did initiate its review of mercury in vaccines, it kicked off a vigorous debate among Federal regulators over the dangers of using thimerosal in childhood vaccines. This debate, which at times pitted one health-care bureaucracy against another, spanned nearly three years. Given the fact that almost twenty years had passed since an expert panel had determined that thimerosal was unsafe in topical. ointments, it is surprising that there was any further debate at all.

There was tremendous reluctance on the part of some officials to admit that a mistake had been made in allowing ethylmercury to be used in vaccines. There was great uncertainty in others caused by the lack of data specifically on ethylmercury. However, the institutional resistance to change was counter-balanced by the growing realization that there was more ethylmercury in childhood vaccines than previously thought, and that nobody had thought to calculate the cumulative amounts. The essence of the debate was captured in a 1999 e-mail from a former FDA official weighing the pros and cons of taking action. He opined that hastening the removal of thimerosal from vaccines would:

. . . raise questions about FDA being ‘asleep at the switch’ for decades by allowing a potentially hazardous compound to remain in many childhood vaccines, and not forcing manufacturers to exclude it from new products. It will also raise questions about various advisory bodies regarding aggressive recommendations for use. (We must keep in mind that the dose of ethylmercury was not generated by ‘rocket science’. Conversion of the percentage thimerosal to actual micrograms of mercury involves ninth grade algebra. What took the FDA so long to do the calculations? Why didn’t CDC and the advisory bodies do these calculations when they rapidly expanded the childhood immunization schedule?)

It is clear that each time an important decision had to be made, the factions that were skeptical of thimerosal’s dangers and favored a "go-slow’’ approach, were able to water down the actions. In 1999, when the Federal government could have ordered thimerosal removed from vaccines by a specific date, or stated a preference for thimerosal-free vaccines, a statement was instead issued asking for a commitment from vaccine manufacturers to eliminate or reduce mercury in vaccines as expeditiously as possible. As a result, almost two years passed before the three major thimerosal-containing vaccines – DTaP, Hib and Hepatitis B – were being manufactured in thimerosal-free formulations. In 2001, when the CDC and its influential advisory committee could have stated a preference for thimerosal-free vaccines, they chose not to do so. As a result, thimerosal-containing vaccines that remained in stock in doctors’ offices continued to be used. In point of fact, we have no proof that in 2003, some children in the United States are not still receiving thimerosal-preserved vaccines that have lingered in medical offices or clinics.

The CDC’s decision not to endorse thimerosal-free vaccines in 2001 is particularly troubling. With the exception of the influenza vaccine, all major childhood vaccines were being manufactured without thimerosal at that time, so there was little threat of shortages. Their failure to state a preference was an abdication of their responsibility.

The task of analyzing the amount of mercury in vaccines and its ramifications was assigned to Dr. Leslie Ball. a pediatrician employed at the FDA and her husband and colleague Dr. Robert Ball, a medical officer at FDA’s CBER. Despite the general lack of scientific research on the toxicity of ethylmercury, their review of the available literature led to two working conclusions:

1. The recommended guidelines for exposure to methylmercury were a good starting point for reviewing exposure to ethylmercury; and
2. The amount of ethylmercury in children's vaccines exceeded the EPA's guidelines for exposure to methylmercury.

An exchange of e-mails in October of 1998 makes clear that Dr. Leslie Ball was already leaning toward the removal of thimerosal from vaccines. It also makes clear that there was internal resistance to such an action. *Dr. Marion Gruber* of the Office of Vaccine Research and Review forwarded an internal FDA memo to Dr. Ball, which concluded that:

" . . . no scientific database to take regulatory actions and to recommend to take thimerosal either out of vaccines or to leave it in. In fact, somebody should perform the adequate studies to come to a conclusion on the toxicity of thimerosal or its metabolized forms."

Dr. Ball's response on October 15, 1998, to Dr. Hasting's conclusion was sharp:

"I disagree about the conclusion regarding no basis for removal of thimerosal. On a strictly scientific basis, yes, there are no data that have looked at the specific issue of thimerosal in vaccines. However, there are factors/data that would argue for the removal of thimerosal, including data on methylmercury exposure in infants and the knowledge that thimerosal is not an essential component to vaccines. In addition, the European community is moving to ban thimerosal."

In a 2002 interview with Committee staff. Dr. Ball confirmed that it was her opinion that, if there was any question, the safest course of action should be taken, and thimerosal should be removed.

An important part of the FDA's review was a comparison of the amount of ethylmercury in vaccines to the recommended safe levels for exposure to methylmercury established by the EPA and the FDA. In 1999, a consultant to the FDA, Dr. Barry Rumack, developed a pharmacokinetic model to analyze the amount of mercury to which infants were being exposed. The FDA produced to the Committee two charts developed from that model dated June 28, 1999. Both charts demonstrate what has now become widely acknowledged. that most children in the 1990s received doses of ethylmercury in their vaccines that exceeded the EPA's limits for exposure to methylmercury (0.1 micrograms per kilogram) for at least the first six months of their lives. Even more significantly, the charts also indicate that most children received doses of ethylmercury that exceeded the FDA's less-restrictive limits (0.4 micrograms per kilogram) for at least the first two months of their lives.

Federal officials have never publicly acknowledged this second fact. In public statements and Congressional testimony, they have acknowledged only that the EPA's lower limit was exceeded. even though simple math makes clear that most infants also breached the FDA's higher limit of 0.4 micrograms per kilogram.

Dr. Neal Halsey, Director of the Institute of Vaccine Safety at Johns Hopkins University, acknowledged this important fact. however. As previously mentioned, Dr. Halsey became convinced that thimerosal should be removed from vaccines. On June 22, 1999. Dr. Ball presented the results of her research to the Medical Policy Coordinating Committee of the FDA's Center for Biologics Evaluation and Review (CBER). Dr. Haisey attended that meeting. The next day, on June 23. 1999, Dr. Halsey wrote a letter to the members of the American Academy of Pediatricians' Committee on Infectious Diseases, which he chaired. He stated:

"In the past few days, I have become aware that the amount of thimerosal in most hepatitis B, DTaP and Hib vaccines that we administer to infants results in a total dose of mercury that exceeds the maximum exposure recommended by the EPA, the FDA, CDC and WHO... ."

Dr. Halsey's admission that more than just the EPA's more conservative guideline was exceeded is a significant departure from the public statements of most Federal officials. Dr. Halsey acknowledges that the guidelines of the EPA. the CDC, the FDA and the World Health Organization were all exceeded.

Another noteworthy fact is that the charts produced by Dr. Rumack, and the FDA's analysis in general, failed to take into consideration the background levels of mercury to which children are exposed from other sources. Dr. Ball pointed out this weakness in her June 1999 e-mail:

"These calculations do not account for other sources of Hg [mercury] in the environment. Even infants can have additional exposures, e.g., breast milk."

One document written by Dr. Ball estimated that exposure to mercury from sources other than vaccines could total roughly 80 to 100 micrograms per year. Background levels were included in all calculations prepared by the European Medical Evaluation Agency. which was at the time reviewing thimerosal in vaccines in Europe. If background levels of mercury had been incorporated into the FDA's and CDC's calculations, the results would have been even more pronounced, possibly even leading to more aggressive measures to remove thimerosal. It is unfortunate that this simple, and scientifically expected step was not taken.

The issue of what to do with thimerosal in vaccines came to a head in the summer of 1999. In June and July, a series of meetings were held involving the FDA, the CDC, the Public Health Service, the American Association of Pediatricians, and other agencies. Documents reviewed by the Committee indicate that the Public Health Service opposed a public effort to remove thimerosal from vaccines. One FDA document stated that the Public Health Service was concerned that stating a preference for thimerosal-free vaccines could "result in unwarranted loss of confidence in immunization programs in the US and internationally, shortages of childhood vaccines might ensue, and other potential far-reaching ramifications are envisioned."

In a July 2, 1999, e-mail, Dr. Ruth Etzel of the Department of Agriculture also noted the Public Health Service's resistance:

"We must follow the three basic rules:

(1) act quickly to inform pediatricians that the products have more mercury than we realized;

(2) be open with consumers about why we didn't catch this earlier;

(3) show contrition.

As you know, the Public Health Service informed us yesterday that they were planning to conduct business as usual, and would probably indicate no preference for either product. While the Public Health Service may think that their 'product' is immunizations, I think their 'product' is their recommendations. If the public loses faith in the PHS recommendations. then the immunization battle will falter. To keep faith, we must be open and honest now and move forward quickly to replace these products."

Adding to the pressure on the Federal government to act was the fact that steps were being taken in Europe to remove thimerosal from vaccines. On April 19, 1999. the European Agency for Medicinal Evaluation (EMEA) met in London. The EMEA is responsible for establishing guidelines for the use of drugs and biologics in the European Union. The FDA's Dr. Norman Baylor attended this meeting. Following this meeting, on June 29, 1999. the EMEA issued a document encouraging the removal of thimerosal from childhood vaccines:

"Vaccines: The fact that the target population for vaccines in primary immunization schedules is a healthy one, and in view of the demonstrated risks of thiomersal (sic) and other mercurial containing preservatives, precautionary measures (as outlined below) could be considered.

"For vaccination in infants and toddlers, the use of vaccines without thimerosal [emphasis added] and other mercurial preservatives should be encouraged."

By early July, a compromise on a course of action was reached in the U.S. between the competing factions. A joint statement was released by the American Academy of Pediatrics and the U.S. Public Health Service. The statement included the following points:

Acknowledged that some children may have been exposed to levels of mercury that exceed one Federal guideline on methylmercury during the first six months of life:

Asserted that there is no evidence of any harm caused by thimerosal in vaccines:

Called on vaccine manufacturers to make a clear commitment to reduce as expeditiously as possible, the mercury content of their vaccines;

Urged doctors and parents to immunize all children, even if thimerosal-free vaccines are not available; and

Encouraged doctors and parents to postpone the Hepatitis B vaccine (which contained thimerosal at the time, and was generally given immediately after birth) until the child is two to six months old, unless the mother tested positive for Hepatitis B. Given the information that the Federal agencies had at the time, the plan of action laid out in the joint statement was inadequate. They could have, but did not, acknowledge that the amount of thimerosal in vaccines exceeded every Federal guideline for exposure to methylmercury for the majority of infants. They could have, but did not, require vaccine manufacturers to remove thimerosal from vaccines by a specific date. They could have, but did not, urge pediatricians to choose thimerosal-free vaccines when both thimerosal-containing and thimerosal-free vaccines were available.

As a result of the limited steps taken in 1999. vaccines containing thimerosal remained on the market for nearly two years. GlaxoSmithKline's Hepatitis B vaccine did not become thimerosal-free until March of 2000, and Aventis Pasteur's DTaP vaccine did not become thimerosal-free until March 2001. In addition, thimerosal-containing vaccines on the shelves in doctor's offices around the country continued to be used in spite of the fact that thimerosal-free versions were available.

The fact that more forceful action to remove thimerosal from the vaccine marketplace was not taken in 1999 is disappointing. Just as disappointing, and even more difficult to understand, is the fact that the CDC, on two separate occasions, refused to publicly state a preference for thimerosal-free vaccines.

In June of 2000, the CDC's Advisory Committee on Immunization Practice met in Atlanta. Among other things. the Advisory Committee was called upon to recommend whether the CDC should issue a public statement of preference for thimerosal-free vaccines. At the time, the industry was in the midst of its transition to thimerosal-free childhood vaccines, and several vaccines containing thimerosal were still on the market. Of particular concern was the DTaP vaccine. In June of 2000, three of the four DTaP manufacturers (Aventis Pasteur, North American Vaccine and Wyeth) were still producing DTaP with thimerosal. Only SmithKline Beecham produced a thimerosal-free DTaP. In addition. because manufacturers of the Hib and Hepatitis B vaccines had just recently converted to formulas that were thimerosal-free or contained trace amounts of thimerosal, older versions of these vaccines containing thimerosal were still in inventories and being used around the country.

A statement of preference by the CDC would have been a clear signal to pediatricians not to use vaccines containing thimerosal, when thimerosal-free versions were available. This action would have substantially reduced the exposure to ethylmercury for many infants. Despite this knowledge, the advisory committee voted unanimously not to state a preference.

CDC officials guided the Advisory Committee toward this conclusion. For example, while three different options were presented to the Advisory Committee members. a detailed policy statement to be issued to the public had been prepared for only one of these options – a statement of no preference. In describing the three options, *Dr. Roger Bernier* of the CDC clearly indicated the CDC's desire not to state a preference for thimerosal-free vaccines. He said:

"We believe that such a policy would be consistent with the evidence that we have at this time. The policy seems to be working

* * *

"As I said, the policy seems to be working. So this indicates that on this particular factor, this policy is moving us in an upward direction towards – it's a positive thing."

In rejecting a statement of preference for thimerosal-free vaccines, the Advisory Committee considered a number of factors. These included a desire to avoid confusion, and a concern that immunization rates might fall, allowing for an outbreak of diseases such as Pertussis or Hepatitis B. However, one of the factors that were also considered was the financial health of the vaccine

industry. In describing the pros and cons of each option, Dr. Bernier returned several times to financial issues:

"We think that having this type of a more staged transition reduces the potential for financial losses of existing inventories, and is somewhat akin to what was done in the transition from oral polio to inactivated polio

* * *

"It could entail financial losses of inventory if current vaccine inventory is wasted. It could harm one or more manufacturers and may then decrease the number of suppliers."

* * *

"The evidence justifying this kind of abrupt policy change does not appear to exist. and it could entail financial losses for all existing stocks of vaccines that contain thimerosal."'

The financial health of the industry should never have been a factor in this decision. The financial health of vaccine manufacturers certainly should never have been more important to the Federal health officials than the health and well being and the nation's children. The CDC has a responsibility to protect the health of the American public. If there were any doubts about the neurological effects of ethylmercury in vaccines on children – and there were substantial doubts – the prevailing consideration should have been how best to protect children from potential harm. However, it appears that protecting the industry's profits took precedent over protecting children from mercury damage.

In opting not to state a preference for thimerosal-free vaccines, the Advisory Committee shrugged off two sensible proposals that were presented during the meeting. A representative of SmithKline Beecham (now GlaxoSmithKline) stated that her company could supply sufficient amounts of thimerosal-free DTaP vaccine to ensure that the youngest infants receiving the initial doses of DTaP could receive thimerosal-free doses:

"I think it's important that you know that, although we cannot supply the entire U.S. market right now for all five doses immediately, we would be able to supply the vast majority of the U.S. market for the primary series, that is with targeting of the first three doses."

Given the repeated concerns expressed about the effects of mercury on the developing central nervous system in very young babies, ensuring thimerosal-free doses for the first three boosters of DTaP would seem to merit serious consideration. However, this suggestion was passed over without any comment.

Later in the discussion, *Dr. Neal Halsey* made another suggestion that would limit the exposure of infants to ethylmercury. He suggested that the Advisory Committee adopt a policy that no child should receive more than one thimerosal-containing vaccine per day:

"Roger, you said that after July, the maximum exposure will be 75 micrograms. My understanding from the information presented from the manufacturers is that there really still is some Hib out there in the market that is being used, but does contain thimerosal as a preservative. There also is hepatitis B out there that does contain it. So there's no guarantee the maximum exposure, would be 75 micrograms. What I proposed last October was that they put a limit of one thimerosal-containing vaccine as a preservative per visit, which would then guarantee what you're looking for. And I think that that's the right policy because that allows for the continued use, though very limited. It eliminates the maximum exposure, but you do have the problem of what's in the pipeline."

Again, it appears that this seemingly sensible proposal received no serious consideration.

One year later, in June of 2001, the Advisory Committee again rejected the idea of expressing a preference for thimerosal-free vaccines, despite the fact that all manufacturers of Hib, Hepatitis B and DTaP had shifted to thimerosal-free products at that point. The CDC's decision not to express a preference for thimerosal-free vaccines, and the Advisory Committee's concurrence in this policy, was an abdication of their responsibility. As a result of their inaction, children continued to receive vaccinations containing ethylmercury at a time when there were serious doubts about its safety.

What makes the CDC's decision even more vexing is that just prior to the Advisory Committee meeting in 2000, a study conducted by the CDC suggested that there was at least a weak correlation between exposure to thimerosal and several types of neurological disorders.

The study, initiated in 1999, reviewed the medical records of 110,000 children in the CDC's Vaccine Safety Datalink (VSD). The VSD is a massive database that tracks the medical records of hundreds of thousands of patients belonging to seven major health maintenance organizations. Phase I of the study was designed to screen data for potential associations between thimerosal-containing vaccines and selected neurological disorders. Phase II was designed to test the hypotheses generated in the first phase.

Phase I produced a statistically-significant association between exposure to thimerosal during the first three months of life, and tics, attention deficit disorder, language and speech delays, and general neurodevelopmental delays. The study did not find a correlation between thimerosal and autism because the sample size of children diagnosed with autism was in all probability not large enough.

The findings of Dr. Verstraeten, the primary author of the study, set off a fierce debate within the Federal health agencies when they were released in June of 2000.

Enough concern was generated that a conference of medical experts was assembled at the Simpsonwood Retreat Center near Atlanta. At this conference, Dr. Verstraeten explained that the study underreported the numbers of children with developmental disorders, including autism. This occurred because the youngest subjects in the study were not yet at an age at which such disorders were likely to be diagnosed. He commented:

"But one thing that is for sure, there is certainly an under-ascertainment of all of these [disorders] because some of the children are just not old enough to be diagnosed. So the crude incidence rates are probably much lower than what you would expect because the cohort is still very young."

Dr. Colleen Boyle of the CDC raised this issue a few months earlier. She states in an April 25, 2000, e-mail to Dr. Frank DeStefano, one of the study's co-authors:

"For me, the big issue is the missed cases – and how this relates to exposure. Clearly there is a gross underreporting - 1.4% of the kids diagnosed with a speech and language problem versus 45% reported in National surveys; less than 1% with ADHD versus 3-10% reported previously, etc."

Had the study been extended until these children were older, a stronger correlation between thimerosal and neurological disorders might have been detected, as more children were diagnosed. However, this was not done. Ultimately, the majority of the Simpsonwood panel determined that the VSD study was not conclusive. Phase II of the VSD study failed to confirm the findings of Phase I, largely because of the small sample size employed (16,000, as opposed to 110,000 in Phase I). The Institute of Medicine determined that, "the small sample size limited the power of the study to detect a small effect, if it exists. The committee concludes that the Phase I and II VSD analyses are inconclusive with respect to causality."

Although the panel assembled at the Simpsonwood Retreat Center had many unanswered questions about the VSD study, some members found the evidence compelling. Dr. David Johnson, Public Health Officer for the state of Michigan and a member of the Advisory Committee on Immunization Practices stated:

"This association leads me to favor a recommendation that infants up to two years old not be immunized with Thimerosal-containing vaccines if suitable alternative preparations are available ...I do not believe that the diagnoses justifies compensation in the Vaccine Compensation Program at this point. I deal with causality, it seems pretty clear to me that the data are not sufficient one way or the other. My gut feeling? It worries me enough. Forgive this personal comment, bat I got called out at eight o'clock for an emergency call and my daughter-in law delivered a son by C-Section. Our first male in the line of the next generation, and I do not want that grandson to get a Thimerosal-containing vaccine until we know better what is going on. It will probably take a long time. In the

meantime, and I know that there are probably implications for this internationally, but in the meantime I think I want that grandson to only be given Thimerosal-free vaccines."

One participant in the Simpsonwood panel later stated that, while there was general agreement that the VSD study did not prove a causal relationship between thimerosal and neurological disorders, it did indicate the need for much more research:

"So what were the responses of the consultants? With regard to the first question, a need for further investigation. Overall the group expressed unanimous feeling that the findings supported a statistically significant, although weak, association, but that the implications – for obvious reasons – are profound. Therefore, the consultants were unanimous in their opinion that further investigation should be pursued with a degree of urgency and, parentheticaliy. not only for public health policy in this country, but for public health policy around the world."

Documents reviewed by the Committee indicate that Dr. Verstraeten was not pleased with the response to his study. During the Simpsonwood conference, he stated:

"When I saw this, and I went back through the literature, I was actually stunned by what I saw – because I thought it was plausible."

A month later, he sent an e-mail to Dr. Phillippe Grandjean, the author of several ground-breaking studies on the toxicity of mercury. Dr. Verstraeten wrote:

"I know that much of this is very hypothetical and, personally, I would rather not drag the Faroe and Seychelles studies into this entire thimerosal debate, as I think they are as comparable as apples and pears at the best. Unfortunately I have witnessed how many experts, looking at this thimerosal issue, do not seem bothered to compare apples to pears and insist if nothing is happening in these studies. then nothing should be feared of thimerosal. I do not wish to be the advocate of the anti-vaccine lobby and sound as if I am convinced that thimerosal is or was harmful; but at least I feel we should use sound scientific argumentation, and not let our standards be dictated by our desire to disprove an unpleasant theory."

It appears that many who participated in the thimerosal debates allowed their standards to be dictated by their desire to disprove an unpleasant theory. The decision by the CDC not to state a preference for mercury-free vaccines is especially difficult to understand, given the deep-seated concerns many policy-makers had about the potential impact of ethylmercury on the fragile central nervous systems of developing babies. FDA officials spoke passionately about this problem at a meeting of the National Vaccine Advisory Committee in the summer of 1999. Dr. Katherine Zoon stated:

"We need to understand more about thimerosal because in the past two days, I think we have recognized that there really is a paucity of data, And I think some of the points made about looking at the developing nervous system, looking at the developing immune systems, and the effects of these agents on that at critical times of development. hasn't been – hasn‘t been done – and I think that knowledge is very important."

At the same meeting. Dr. Bernard Schwetz, the Director of the FDA’s toxicology center, stated:

". . . the sensitivity of the fetus versus the neonate is very important, and for some of you who have forgotten about the sensitive windows during fetal development, the nervous system develops post-natally. So it isn’t unreasonable to expect that there would be particular windows of sensitivity. So it isn't the matter of averaging the dose over the whole neonatal period – it’s what's the week or what's the day or what's the series of hours that represent a particular event in the development of the nervous system when this whole thing might be dangerous. There may be weeks surrounding that when there isn’t a major problem. We don't have that information.

VII. Focused, Intensive Research effort is Badly Needed

One of the most consistent refrains heard by the Committee throughout its three-year investigation is that not enough research has been done. The Committee has heard testimony from parents, scientists and government officials that much more research is needed, and that well-designed unbiased

research that addresses the specific issues of vaccine-injury must be conducted. Areas in which research is urgently needed include:

- The causes of autism.
- Treatments for those suffering from autism spectrum disorders.
- Possible relationships between vaccine ingredients like thimerosal and autism.
- The neurotoxicity of ethylmercury.
- The neurotoxicity of dental amalgams containing mercury.
- Immune system and gastrointestinal system dysfunction after vaccination.

In 2001, the Institute of Medicine called for much more research into possible relationships between vaccines and autism spectrum disorder. In its report on an alleged relationship between the MMR vaccine and autism, the IOM noted that it "does not exclude the possibility that MMR vaccines could contribute to ASD" and recommended "this issue receive continued attention." The IOM made the following research recommendations:

- Use accepted and consistent case definitions and assessment protocols for ASD (autism spectrum disorder) in order to enhance the precision and comparability of results from surveillance, epidemiological, biological investigations.
- Explore whether exposure to MMR vaccine is a risk factor for ASD in a small number of children.
- Develop targeted investigations of whether or not measles vaccine-strain virus is present in the intestines of some children with ASD.
- Encourage all who submit reports to VAERS of any diagnosis of ASD thought to be related to MMR vaccine to provide as much detail and as much documentation as possible.
- Case Reports in VAERS or elsewhere of "rechallenge' should be identified, documented, and followed up. (In the context of MMR vaccine and ASD, rechallenge refers to children who appeared to have experienced some form of neurological regression after a first dose of MMR or other measles-containing vaccine and who appeared to have experienced another regression following a second dose of MMR or other measles-containing vaccine.)
- Study the possible effects of different MMR immunization exposures.
- Conduct further clinical and epidemiological studies of sufficient rigor to identify risk factors and biological markers of ASD in order to better understand genetic or environmental causes.
- In its report on thimerosal-containing vaccines and autism, the IOM stated that there was not enough evidence to reach any conclusions about a possible relationship between thimerosal and autism spectrum disorders.

The IOM called for the following types of research:
- Case-control studies examining the potential link between neurodevelopmental disorders and thimerosal-containing vaccines;
- Further analysis of cohorts of children who did not receive thimerosal-containing doses of vaccines during clinical trials;
- Epidemiological studies comparing the prevalence of neurological disorders in children who received vaccines before thimerosal was removed to children who received vaccines after it was removed;
- An increased effort to identify the primary sources and levels of prenatal and postnatal exposure to thimerosal;
- Clinical research on how children metabolize and excrete metals;
- Theoretical modeling of ethylmercury exposures, including the incremental burden of thimerosal on background mercury exposures from other sources;
- Research in appropriate animal models on neurodevelopmental effects of ethylmercury;
- Rigorous scientific investigations of chelation as a treatment for neurodevelopmental disorders;
- Research to identify a safe, effective and inexpensive alternative to thimerosal for countries that decide they want to follow the example of Europe and the United States and discontinue its use.

One concern that has been raised many times is that responsibility for research into autism and related issues at the NIH has been fragmented. Responsibility is divided among the National Institute of Mental Health, the National Institute of Neurological Diseases and Stroke, the National Institute of Child Health and Human Development, and the National Institute of Environmental Health Sciences. Greater overall coordination is needed. The NIH needs to develop a strategic plan on autism research to bring together the diverse activities, develop a strategy and timeline, and focus research on the most pressing research needs.

Another concern is the lack of a sufficient investment into research on autism and its causes. Autism is growing at epidemic proportions and nobody knows why. The rates of autism doubled during the Committee's investigation, yet funding for research on autism lags badly behind funding for other serious diseases. The NIH. with a budget of $27 Billion dollars last year, invested just $56 Million towards autism research. Much of that research has been focused on looking for genetic causes of autism: which is important, but does not address the possible connection to vaccine injury. To put the spending on autism in perspective, the Committee compared it to the spending on two other serious epidemics – HIV/AIDS and diabetes. At the same time that the NIH was spending $56 Million on autism research, they spent $688 Million on diabetes research and over $2.2 Billion on HIV/AIDS research.

The Centers for Disease Control and Prevention has also been negligent in addressing the research needs regarding vaccine injury and a connection to the autism epidemic. In FY 2002, the CDC invested $11.3 Million on autism. while spending $62 Million on diabetes, and $932 Million on HIV/AIDS. With spending for autism 80 times less than that for AIDS, it is obvious that CDC is not addressing the autism epidemic with enough rigor. Instead, at the time of the Committee's April 2002 hearing, the CDC actually planned to cut autism research spending to $10.2 Million.

Of additional concern has been the CDC's bias against theories regarding vaccine-induced autism. Rather than aggressively work to replicate clinical findings with laboratory data that showed a relationship between vaccines and autism, (the Wakefield autism entercolitis studies), the CDC funded researchers who also worked for vaccine manufacturers to conduct population-based epidemiological studies to look at the possible correlation between vaccine injury and a subset of the population that might be injured. The CDC to date has relied too heavily on epidemiological findings. While epidemiological studies are important, they are not a substitute for focused, clinical research.

Chairman Burton expressed some of these concerns at the June of 2002 hearing:

"Officials at HHS have aggressively denied any possible connection between vaccines and autism. They have waged an information campaign endorsing one conclusion on an issue where the science is still out. This has significantly undermined public confidence in the career public service professionals who are charged with balancing the dual roles of assuring the safety of vaccines and increasing immunization rates. Increasingly, parents come to us with concerns that integrity and an honest public health response to a crisis have been left by the wayside in lieu of protecting the public health agenda to fully immunize children. Parents are increasingly concerned that the Department may be inherently conflicted in its multiple roles of promoting immunization, regulating manufacturers, looking for adverse events, managing the vaccine injury compensation program, and developing new vaccines. Families share my concern that vaccine manufacturers have too much, influence as well. How will HHS restore the public's trust?"

It is clear that inadequate scientific evidence exists to understand fully the likely damage done to a generation of children who were repeatedly exposed to significant levels of mercury through their mandatory childhood immunizations. While the use of safe and effective vaccines for dangerous infectious diseases is very important, the lack of quality data addressing the risk of adverse reactions to vaccines and their components undermined public support for this important public health tool.

IX. Conclusions

It is obvious from all accounts that there is a crisis in the United States regarding the dramatic rise in autism rates and the resulting strain placed on families, the education system, and State Medicaid and disability programs, A further crisis will ensue in the next two decades when we see an explosion in the need for adult services and long-term housing.

In a further attempt to raise the level of awareness of the autism epidemic, in November of 2002, Chairman Burton called upon the President to announce a White House Conference on autism to "*galvanize a national effort to determine why autism has reached epidemic proportions in this country*." Chairman Burton suggested this would be a valuable opportunity to "bring together the best minds from across the country to chart a course of scientific research to uncover the underlying causes of this epidemic. . . . Mr. President. you are in a unique position to provide the leadership that is necessary to organize a national effort to resolve these problems.'

In January of 2003, the response from *Bradley A. Blakeman*, Deputy Assistant to the President and Director of Appointments and Scheduling was, "I do not foresee an opportunity to add this event to the calendar." It is unfortunate that the request of the Chairman, and the hundreds of families who personally appealed to the White House for this Conference did not appear to have been brought to the personal attention of the President, who has stated that "no child shall be left behind."

Vaccines are the only medicines that, American citizens are mandated to receive as a condition for school and day care attendance, and in some instances for employment. Additionally, families who receive Federal assistance are required to show proof that their children have been fully immunized. While the mandate for which vaccines must be administered is a State mandate, it is the Federal Government, through the Centers for Disease Control and Preventian (CDC) and its Advisory Committee for Immunization Practices that make the Universal Immunization Recommendations to which the States refer for determining mandates.

Federal programs and funding to State programs provide immunizations free-of-charge to many children. In July of 2000, it was estimated that 8,000 children a day were being exposed to mercury in excess of Federal guidelines through their mandatory vaccines. Given the importance of vaccination in our overall public health strategy, it is imperative that the Department of Health and Human Services adequately addresses the concerns of families of whose children have possible vaccine-induced autism. The continued response from agency officials that "there is no proof of harm" is a disingenuous response. The lack of conclusive proof does not mean that there is no connection between thimerosal and vaccine-induced autism. What the lack of conclusive proof indicates is that the agency has failed in its duties to assure that adequate safety studies were conducted prior to marketing. Furthermore, in the last two decades, after determining that thimerosal was no longer "generally recognized as safe" for topical ointments, the agency did not extend their evaluation to other applications of thimerosal, in particular as a vaccine preservative.

One leading researcher made the following statement to the Committee in July of 2000: "There's no question that mercury does not belong in vaccines.

"There are other compounds that could be used as preservatives. And everything we know about childhood susceptibility, neurotoxicity of mercury at the fetus and at the infant level, points out that we should not have these fetuses and infants exposed to mercury. There's no need of it in the vaccines."

The Food and Drug Administration's (FDA) mission is to "promote and protect the public health by helping safe and effective products reach the market in a timely way, and monitoring products for continued safety after they are in use." However, the FDA uses a subjective barometer in determining when a product that has known risks can remain on the market. According to the agency, "at the heart of all FDA's product evaluation decisions is a judgment about whether a new product's benefits to users will outweigh its risks. No regulated product is totally risk-free, so these judgments are important. FDA will allow a product to present more of a risk when its potential benefit is great – especially for products used to treat serious, life-threatening conditions."

This argument – that the known risks of infectious diseases outweigh a potential risk of neurological damage from exposure to thimerosal in vaccines – is one that has continuously been presented to the Committee by government officials. FDA officials have stressed that any possible risk from thimerosal was theoretical, that no proof of harm existed. However, the Committee, upon a thorough review of the scientific literature and internal documents from government and industry, did find evidence that thimerosal did pose a risk.

Thimerosal used as a preservative in vaccines in likely related to the autism epidemic. This epidemic in all probability may have been prevented or curtailed had the FDA not been asleep at the switch regarding the lack of safety data regarding injected thimerosal and the sharp rise of infant exposure to this known neurotoxin. Our public health agencies' failure to act is indicative of institutional malfeasance for self-protection and misplaced protectionism of the pharmaceutical industry.

A Case-Control Study of Mercury Burden in Children with Autistic Spectrum Disorders

J Am Phys Surg. 2003, Fall, 8(3), 2003
https://www.jpands.org/jpands0803.htm // https://www.jpands.org/vol8no3/geier.pdf

Abstract

Large autism epidemics have recently been reported in the United States and the United Kingdom. Emerging epidemiologic evidence and biologic plausibility suggest an association between autistic spectrum disorders and mercury exposure.

This study compares mercury excretion after a three-day treatment with an oral chelating agent, meso-2,3-dimercaptosuccinic acid (DMSA), in children with autistic spectrum disorders and a matched control population. Overall, urinary mercury concentrations were significantly higher in 221 children with autistic spectrum disorders than in 18 normal controls (Relative Increase (RI)=3.15; $P < 0.0002$). Additionally, vaccinated cases showed a significantly higher urinary mercury concentration than did vaccinated controls (RI=5.94; $P<0.005$). Similar urinary mercury concentrations were observed among matched vaccinated and unvaccinated controls, and no association was found between urinary cadmium or lead concentrations and autistic spectrum disorders.

The observed urinary concentrations of mercury could plausibly have resulted from thimerosal in childhood vaccines, although other environmental sources and thimerosal in Rh (D) immune globulin administered to mothers may be contributory.

Regardless of the mechanism by which children with autistic spectrum disorders have high urinary mercury concentrations, the *DMSA treatment described in this study might be useful to diagnose their present burden of mercury*.

...

Discussion

This study shows a strong association between increased urinary mercury concentrations following three days of treatment with DMSA and the presence of an autistic spectrum disorder. The statistically significant association persists when vaccinated cases are compared with matched vaccinated controls. No association was found between post-DMSA urinary cadmium or lead concentrations and autistic spectrum disorders. Lastly, although the study populations were small, the heavy-metal concentrations measured in matched vaccinated and unvaccinated control children were small and showed no statistically significant differences in urinary mercury, cadmium, and lead concentrations following a three-day treatment with DMSA.

...

Our analysis shows that *children who developed autistic spectrum disorders had significantly greater accumulated mercury than controls*. Our results are similar to those of the retrospective study by Holmes et al. They observed that there was a significant relationship between increasingly severe autism and decreasing mercury levels in first baby haircuts in comparison to normal controls. Our results and those of Holmes et al. probably result from a decreased ability of children with autistic spectrum disorders to excrete mercury, resulting in the retention of potentially toxic mercury levels.

...

Mercury concentrations in the human brain are six times greater than the blood. This stems from the fact that thimerosal contains the ethylmercury radical attached to the sulfur atom of the thiol group of salicylic acid. Generally, mercuric ions bind tightly but reversibly to thiol ligands. It is likely, therefore, that the ethylmercury cation of thimerosal dissociates from the thiosalicylic acid moiety immediately after injection to bind to the surrounding thiol ligands present in great excess in tissue proteins. ...

The results of our present study, combined with the published observations included above, disagree with the views expressed by Nelson and Bauman and support the hypothesis of Bernard et al., who have compared the similar biological abnormalities commonly found in autism and the corresponding pathologies arising from mercury exposure. Distinct similarities were found between autism and mercury exposure in their effects upon biochemistry, the immune system, the central nervous system structure, neurochemistry, and neurophysiology

...

Moreover, our findings appear to *confirm previously published epidemiologic evidence showing a direct association between increasing mercury from thimerosal-containing childhood vaccines and neurodevelopment disorders in children*. These studies showed that there was a two to sixfold, statistically significant increased incidence of neurodevelopment disorders following an additional 75-100 mcg dosage of mercury from thimerosal-containing childhood vaccines in comparison to thimerosal-free childhood vaccines. *These studies showed dose-response curves demonstrating a close, statistically significant correlation between increasing mercury doses from childhood vaccines and childhood neurodevelopment disorders*.

...

The results of our analyses suggest that mercury should be removed immediately from all biologic products, and others have reached a similar conclusion. Kravchenko et al. stated, "Thus thimerosal, commonly used as a preservative, has been found not only to render its primary toxic effect, but also [to be] capable of changing the properties of cells. This fact suggests that the use of thimerosal for the preservation of medical biological preparations, especially those intended for children, is inadmissible." Cox and Forsyth reported, "However, individual cases of severe reactions to thimerosal demonstrate a need for vaccines with an alternative preservative." Similarly, "...reactions can be expected in such a high percentage of merthiolate-sensitive persons that merthiolate in vaccines should be replaced by another antibacte- rial agent." Rohyans et al. revealed in 1984, "Although aqueous merthiolate has been used for years as a topical antiseptic, a recent review of its use by the Food and Drug Administration resulted in its classification as 'less than effective.' Furthermore, two of the ingredients (thimerosal and borate) in merthiolate are toxic if absorbed or injected." In addition, Seal et al. reported in *The Lancet*, "*Thimerosal is a weak antibacterial agent that is rapidly broken down to products, including ethylmercury residues, which are neurotoxic*. Its role as a preservative in vaccines has been questioned, and the pharmaceutical industry itself considers its use as historical."

[Seal D, et al. *The case against thiomersal. Lancet.* 1991 Aug 3;338(8762):315-6. doi: 10.1016/0140-6736(91)90455-x]

Conclusion.

Analysis of post-DMSA urinary mercury excretion found a strong, statistically significant association between greatly increased urinary mercury concentrations and the presence of autistic spectrum disorders in vaccinated children.

The mercury levels measured in this study could plausibly have resulted from exposure to mercury in routine childhood vaccines in the United States, while thimerosal in Rh (D) immune globulin and other potential environmental sources of mercury may be contributory.

Our study is unable to determine whether the statistically significantly higher urinary concentrations of mercury measured in cases in comparison to controls is caused by higher exposure to mercury, reduced ability to excrete mercury, or a combination of these explanations. Regardless of the mechanism by which children with autistic spectrum disorders accumulate high mercury levels, the DMSA treatment course described in this study appears useful and important in determining mercury body burden.

The data from this study, along with emerging epidemiologic data showing a link between increasing mercury doses from childhood vaccines and childhood neurodevelopment disorders, *increases the likelihood that mercury is one of the main factors leading to the large increase in the rate of autism and other neurodevelopment disorders*. It is to be hoped that removing thimerosal from all childhood vaccines will contribute to a decline in the numbers of new cases of autistic spectrum disorders.

Unfortunately, as discussed in a recent publication, many of the vaccines recommended for the childhood immunization schedule contained the full doses of thimerosal through 2002 (FDA, personal communication), and in addition, pediatric vaccines such as influenza, diphtheria-tetanus (DT), and possibly others, still contain the full amounts of thimerosal in 2003. Therefore, it may be quite some time before a decrease in the prevalence of neurodevelopment disorders is seen.

A Byronchild world exclusive report Release

Byron Child, 7 March 2005
https://web.archive.org/web/20050319083834/http://www.byronchild.com/vacc.htm

A Dragon By the Tail

On the eve of an historic, billion-dollar world vaccination campaign, a leaked transcript ignites questions of vaccine safety and research corruption. Meanwhile, US senators fast-track a bill to protect vaccine manufacturers from litigation. With millions of lives at stake, and billions of dollars to loose, will a merger of philanthropy, big business and compromised science win an epic race between corporate agendas and medical ethics? In this world exclusive report, byronchild exposes how the most powerful medical research bodies in the United States compromise their vaccine safety research for vested interests, as they assist in a global vaccine policy, while a bill looms in the background to protect it all.

By Lisa Reagan

On January 24, 2005 -- the same day the Global Alliance for Vaccines and Immunization (GAVI) announced the receipt of $750 million for its historic world vaccination campaign – seven US Senators introduced Senate Bill 3 . The bill is an unprecedented act giving comprehensive liability protections to vaccine manufacturers , restricting Freedom of Information Acts on drug/vaccine safety, and pre-empting states' rights to ban mercury from children's vaccines, all under the bill's official title: ‘‘Protecting America in the War on Terror Act of 2005".

Meanwhile in Texas, a US District Court judge has ordered the worlds' “big five” vaccine manufacturers to “produce any and all documents relating to payments made to, or stock ownership” by the seventeen members of the Institute of Medicine's Immunization and Safety Review Committee who issued a report last year denying a link between childhood vaccines and the country's autism epidemic.

The judge issued the order after receiving a leaked internal transcript in the first civil juried lawsuit against the vaccine manufacturers that allegedly proves the Institutes of Medicine's committee members “predetermined the necessity of not finding causality between vaccines and autism and/or neurological injury” in its official reports on the issue.

Judge T. John Ward also ordered the vaccine manufacturers to produce all communications with “members of the World Health Organization, the Center for Disease Control, the Food and Drug Administration, the Institute of Medicine, the Brighton Collaboration, or the Global Alliance for Vaccines and Immunization relating to the issue whether the thimerosal contained in pediatric vaccines causes autism or other neurological disorders.”

The vaccine manufacturer's legal counsel balked at the amount of expense involved in producing such extensive documentation for the court; however, Judge Ward reassured the defense that the process could be useful for the more than 300 pending lawsuits waiting to be tried in the US .

Vaccine manufacturers Aventis Pasteur, Merck, GlaxoSmithKline, Wyeth and Eli Lilly and Co. are cited as defendants in the lawsuit brought by the parents of a child who developed autism after receiving mandatory routine childhood immunizations.

The same IOM reports denying a link between vaccines and the country's autism epidemic have been used:

- to endorse standardized case definitions for Adverse Events Following Immunizations for "global dissemination";
- as justification for Senate Bill 3's sweeping provisions and protections;
- as a cause for no further federal monies to be spent on research of the potential vaccine/autism link;
- as a reason to silence media inquiries into vaccine safety issues, and;
- as a defense for dismissing over 4,500 petitions for vaccine injuries in a federal court.

Is it possible that a closed meeting transcript alleged as proof of a ploy to ignore vaccine risks, a near billion dollar grant for a global vaccination campaign, emerging lawsuits for vaccine injuries and a sweeping federal bill to protect vaccine manufacturers are unrelated?

Is it possible that in spite of US Congressional hearings and reports citing widespread conflicts of interest between federal policy makers and the vaccine industry that Senate Bill 3 will defy the US Constitution's provisions for state and civil rights in order to shield vaccine manufacturers from liability?

And finally, how will a world vaccine policy influenced by allegedly "predetermined" safety reports implemented through a global alliance of international governments and vaccine manufacturers with a fund of billions headquartered in Geneva, Switzerland, support or protect the health and human rights of targeted Third-World country peoples?

History of the IOM's Immunization and Safety Review Committee

Insight to these questions may lie in the pivotal year of 1999, a year preceded by a decade of declining vaccine sales, major breakups within the manufacturing industry, increased requirements for routine childhood vaccines, a growing autism epidemic, and researchers and media reports questioning the safety of vaccines and their possible link to autism.

Autism – an Epidemic too Big to Ignore

During the years that the IOM reports were drafted, 2001 to 2004, more than 4,500 petitions for "vaccine injuries resulting in autism spectrum disorder", piled up in an Omnibus Autism Proceeding with the US Court of Federal Claims.

Currently, autism is the fastest growing developmental disability in the United States, with one in 166 US children diagnosed with Autism Spectrum Disorder, up from 1 in 2500 a decade ago, and over 1.77 million affected.

In the last four years alone, the number of cases of autism has nearly doubled in California. "It is growing much faster than the growth of the population and other forms of childhood disabilities," states Cliff Allenby, director of the State Department of Development Services.

A report by the independent Environmental Working Group issued in December 2004 found that autistic children had less glutathione, an antioxidant that helps rid the body of toxic metals, when compared to a sample of healthy children. The study, led by Jill James, PhD, a professor of biochemistry and pediatrics at the University of Arkansas for Medical Sciences, found that a glutathione deficit "may contribute to the development and clinical manifestation of autism."

Autism is not a disease but a 'condition' often characterized by a failure to bond, lack of social interaction, avoidance of eye-to-eye contact, difficulties in language development, and repetitive behaviors known as stimming (self-stimulation). Milder forms of autism are *Asperger's Syndrome* , *Pervasive Developmental Disorder* and *Attention Deficit/Hyperactivity Disorder* . Collectively they are known as Autism Spectrum Disorder, ASD.

States Take Matters Into Their Own Hands

After multiple congressional hearings on conflicts of interest within the vaccine industry and government, repeated IOM reports stating no link between vaccines and autism, and with no official FDA recall for mercury containing vaccines, US citizens and state legislators took matters into their own hands and in May 2004, Iowa became the first state to ban mercury in vaccines.

Autism is Treatable: Hope that is real, treatments that heal

Byron Child, June 2005
https://web.archive.org/web/20050319035743/http://www.byronchild.com/arts37.htm

My name is Michael Augerson.

I'm autistic. Basically when you're autistic, you feel urges to do things that you really need to do. You can't stop yourself. Like you have taken a drug. You have no idea what others are talking about, because it doesn't make any sense to you. Others think of you as a freak, loon, or a retard.

I was able to find a way to change. Some doctors have been able to find the problems and correct them. I have a special diet, take a lot of vitamins, stay away from chemicals and take medicine for my colon and an antifungal. For me, it's like I've become a new man (or should I say teen). I now have an ability to control myself. I can understand the plot of a book and movie. I can have friends without them teasing me. I've also changed physically. A year ago, I was shorter than my brother who is three years younger. Now I'm as tall as my mother. I feel as if I've been reborn. For the first time in fourteen years, I feel normal. Other people don't see me as normal yet. I would like it if they would treat me as an equal.

I still have some problems and am willing to go through tests to find the answers. I think one day I might be able to succeed in not being autistic. It would be a dream come true for me and my family.

Written by Michael Augerson, 14, in June 2004. Michael, whose parents were told he would be institutionalised, has been healed through biomedical treatments and has been mainstreamed into a public school where he is an honour roll student.

Parents pioneer alternative paths to recovery

When Michael was diagnosed by a neurologist with severe autism at age three, he did not recognise his mother, was highly aggressive, self-abusive and rarely slept. ‘Back then, in 1989, no-one knew what autism was, much less how to treat it,' explains Michael's mother Sara.

Back then, Sara was also told that her cravings for two to three cans of tuna fish a day were healthy for her pregnancy. These days, thousands of families are discovering successful biomedical treatments for autism and cans of tuna carry warning labels to pregnant mothers about possible mercury contamination.

Like many parents of autistic children, Sara was left on her own to discover through her mother's intuition and observation what did and didn't help Michael's symptoms. She observed that diet changes, treatments for fungal infections and parasites were attributing to her son's slow, but medically documented recovery from severe autism.

‘It was a literal fluke that we discovered in Singapore – when our entire family was being treated for parasites – that this medicine would help Michael's autism. Within hours of being treated he improved dramatically. Now I can tell by looking at him if he has another parasite in him.'

Sara believes her son's recovery milestones over the years have been a Catch-22 . ‘People don't believe that these kids get better. When Michael starts improving, people say he wasn't autistic to begin with. It was really hard to get anyone to listen to us. There was no methodology to follow for treatments. We were in a constant crisis and just running with it.'

Sara and her family are one of thousands of families who have discovered successful treatments for their children's autism and shared their successes with other parents and researchers at the Autism Research Institute, a San Diego-based nonprofit and world centre for research and information that has tracked promising treatments - discovered by parents and researchers – since 1967. ARI's database is the world's largest with more than 37,000 detailed case histories of autistic children from over 60 countries.

Until 1964, when ARI's founder Bernard Rimland, PhD, released his groundbreaking book, Infantile Autism: The Syndrome and its Implications for a Neural Theory of Behaviour, the current medical belief was that autism was caused by an unloving 'refrigerator' mother and the sanctioned medical treatment for autism was 'for the mother to acknowledge her guilt, and disclose why she hated the child and wished it had never been born'.

'The child, in so-called "play therapy" was provided with a paper or clay image of a woman (his mother) and was encouraged to tear it to bits, thus expressing his hostility towards his mother, whom the psychotherapists were positive had caused his autism. There were a few drugs that were also used with autistic children, but then, as now, the idea was not to treat the autism but to slow the children down enough to make life tolerable for those who must deal with them,' said Rimland.

Rimland's book, inspired by the birth of his own autistic son Mark in 1956, exposed the lack of scientific evidence to support the 'bad mother' cause of autism, won the 1964 Century Award, and attracted the attention of parents worldwide who contacted Rimland and shared with him their personal treatment successes with their own autistic children.

Rimland went on to found the Autism Research Institute that has independently researched and chronicled these successful treatments over the past 40 years. In October 2004, over 1,000 families presented their children's medically documented recoveries from autism to the public and media at the annual ARI Defeat Autism Now! conference in Los Angeles, California.

The documented epidemic of autism

From the 60s to today, the rate of autism has skyrocketed in the United States from 1 in 10,000 to 1 in 166, and a further 1 in 6 children is diagnosed with a developmental disorder, according to the Autism Alert released by the US Department of Health & Human Services, the Centres for Disease Control, and the American Academy of Pediatrics in February 2004. Over 30,000 Australian children have autism, with a dramatic increase of more than 200% in diagnoses over the past 10 years in Australia.

Autism is not a disease but a 'condition' often characterised by a failure to bond, lack of social interaction, avoidance of eye-to-eye contact, difficulties in language development, and repetitive behaviours known as stimming (self-stimulation). Milder forms of autism are Asperger's Syndrome , Pervasive Developmental Disorder and Attention Deficit/Hyperactivity Disorder . Collectively they are known as Autism Spectrum Disorder.

While cases of autism have exploded over the last 40 years, medical treatments have not. Today, still abandoned by mainstream medical practitioners, parents and even grandparents – many of whom are scientists and physicians themselves – have consistently remained the pioneers of successful treatments and even cures. Many of these parents have worked with the scientists at the Autism Research Institute to create the Defeat Autism Now! protocol that is freely shared with other suffering families.

The name of the movement and its protocol, Defeat Autism Now! (DAN!) was in response 'to the complacency and lack of urgency that were so evident at the National Institutes of Health, and at the medical schools, where research on the treatment of autism was virtually non-existent, except for experimental trials of various drugs designed for use on adults,' testified Rimland to the US House Government Reform Subcommittee on Human Rights & Wellness in November 2003. The congressional subcommittee is currently investigating alternative treatments for autism.

'The experience of scientists and physicians within the DAN! movement leads us to the paradox that while the epidemic must spring from common causes, the treatment of children caught in the epidemic demands a thoughtful respect for their individuality. We wish to share with fellow scientists, clinicians, and family members, observation and data that may help our communities take on the responsibilities demanded by an epidemic: a capacity for prompt response to evolving information from direct experience with the situation,' said Rimland.

Jaquelyn McCandless, MD, author of Children with Starving Brains: A Medical Treatment Guide for Autism Spectrum Disorder , and a board certified neurologist and psychiatrist, began researching treatments for autism after her granddaughter was diagnosed in 1996. She has written her book in hopes of helping parents to become educated and empowered to take action now for their children.

'As a grandmother and psychiatrist, my passion to find answers made me impatient with psychiatry and behavioural medicine's head-in-the-sand attitude that autism is definitely genetic and thus incurable and untreatable except for early intervention and the use of behaviour-controlling drugs,' writes McCandless.

'Many medical doctors still advise patients not to bother with special diets or vitamins and minerals … One doctor insisted that if there was no evidence of mercury in the blood test then there was no point in pursuing the heavy metal issue further, not aware or interested in the fact that the presence of mercury, except for a very recent heavy exposure, will not show up on regular blood tests.

'To no avail I pointed out that many of the doctors and researchers who pursue "new" approaches are parents or grandparents of children with autism and would not be trying these methods on their own kin if they thought they weren't safe and effective.'

Same song, second verse

With history presenting consistent evidence that medical science takes decades to catch up with pioneering researchers like those at ARI and the practitioners of DAN! protocol, it is not a surprise to parents that the US Food and Drug Administration's website pronounces their children hopelessly incurable and parents who believe otherwise are 'desperate, easy targets for unproven therapies and sham products'.

'Progress in the acceptance of useful medical interventions is painfully slow – it is not uncommon for a safe and effective treatment to be available for decades before it is widely implemented. A recent example is the use of small amounts of folic acid, a very safe B vitamin, as a means of preventing severe birth defects. It is estimated that over 25,000 cases of mental retardation could have been prevented in the US if widespread use of folic acid supplements had been recommended when the discovery was first announced,' said Rimland.

In an open letter to the then FDA Commissioner Mark McClelland, MD, the ARI has requested that the government agency rescind its 'grossly exaggerated and unjustifiably pessimistic', statements, to reveal the public input prior to the issuance of their policy, and to abstain from enforcing the policies which flow from these statements 'until we, and our colleagues, as well as other members of the public have had an opportunity to present the information your agency has ignored.'

FDA Public Affairs Specialist Susan Kruzan, pointed out that, 'There are no approved treatments of any kind by the FDA for autism. Not even the commonly prescribed pharmaceuticals Ritalin and Risperdal are approved for treating autism,' she noted.

Moving forward, outside the box

Unlike Sara Augerson, whose son Michael was born autistic and therefore is a rare case of Classic Autism, Carolyn Yount watched her now four-year-old son Chandler slowly deteriorate after each round of vaccines at their paediatrician's office. Chandler is a more commonly seen case of Regressive Autism (incidents of children who are born autistic are 1 in 10,000 while incidents of children who become autistic after birth are 1 in 166).

'At two months he had his first round of shots and he started having stomach problems. At four months he got another round of shots and took another turn for the worse. He would pull his legs up to his chest and scream constantly,' said Carolyn. 'Now in retrospect I realise my son's stomach was being torn up by the thimerosal. At 20 months he was diagnosed with autism by a neurologist.' Thimerosal (known as thiomersal in Australia) is the neuro-toxic mercury derivative used as a preservative in some children's vaccines.

Because DAN!-trained doctors are still rare, in July 2002, Yount and her family drove 10 hours from Alabama to Virginia to meet with Elizabeth Mumper, MD, an Associate Professor of Clinical Pediatrics and Family Medicine at the University of Virginia. 'Dr. Mumper told me that Chandler was a very sick little boy and for the first time I saw all of him and he was pale as a ghost with horrendous circles under his eyes with this very distended abdomen… I just broke down because I couldn't believe this happened right before my eyes and I could be in such denial,' said Yount.

In addition to switching Chandler to the DAN! diet (casein and gluten-free), Mumper treated Chandler for mercury-toxicity. Heavy metal toxicity is common in autistic children and is thought to be attributable to a genetically vulnerable child's inability to excrete metals resulting from multiple modern sources such as mercury dental amalgams, power plant emissions, seafood like tuna, and mercury and aluminum in childhood vaccines.

Yount warns parents that the DAN diet can be 'very hard for people who are used to eating out. It took us 10 months to really get the hang of the diet but now his tummy is no longer distended and his bowels are normal and he is sleeping,' said Yount. 'We have changed every aspect of who we were before. Now everything we eat is organic and we have a water filtration system on the house, organic sheets, mattresses, hard wood floors. Now we think about everything we used to do with shock. We didn't realise before how toxic our world is.'

US Congress investigates successful treatments

As part of an ongoing congressional investigation into the autism epidemic, oversight hearings are ongoing and held by Dan Burton (R-IN), Chairman of the US House Government Reform Subcommittee on Human Rights & Wellness in November 2003 and May 2004. The congressional committee heard from Rimland about the success of DAN! and from other experts on groundbreaking new treatments that are effectively improving the medical condition of autistic children and adults.

'History teaches us that debilitating diseases like autism do not simply go away,' states Chairman Burton, whose congressional investigations into mercury and autism over the past years were inspired by his autistic grandson. 'I am encouraged that many of my colleagues in Congress, as well as our health officials, are finally starting to wake up to this realisation, and devote the necessary attention and resources to understand, and ultimately cure autism.'

One of the most poignant stories of a parent fighting for their child's recovery from autism was presented to Burton's committee by Rashid Buttar, DO, on May 6, 2004. Buttar testified that he had stopped taking referrals for autistic children from paediatric neurologists in 1998, despite the success of his hyperbaric oxygen treatments because 'the emotional component was overwhelming, just having to deal with the pain and frustration of the parents of these children'.

Then on January 25, 1999, Buttar's son Abid Azam Ali Buttar was born and Buttar became one of those frustrated parents as he watched his son slip away and into the din of regressive autism.

'The oceans of tears I cried and the hours I spent trying to figure out what was happening to my son are no different than that of any other parent in the same situation except that I am one of 190 US doctors board certified in clinical metal toxicology. When he would make eye contact with me his eyes would say, "I know you can do it Dad". The expression he would give me, just for an instant, would be that of a father encouraging his son. I thought, if this is metal related, I should know how to fix this problem."

Not only did Buttar's son fully recover from autism, but Buttar's pioneering treatments have led to the International Hyperbaric Medical Association and the American Board of Clinical Metal Toxicology collaborating under the supervision of the Oklahoma University Health Sciences to research and provide this treatment to autistic children.

The cost of inaction, action, and the alternative?

In a US Congressional testimony in June 2002, Dr. Jeff Bradstreet, MD, founder of the International Child Development Resource Centre and father of an autistic child, stated, 'While no precise studies have attempted to look at the cost of correcting the biological problems associated with ASD, at least one report from England places the custodial costs of ASD in the range of US$3 to 4 million per child per lifetime, with a societal cost that would likely be three times the individual cost. The cost of education, medical care, and therapies for behavioural and physical symptoms is staggering. Many of our families report having paid US$50,000 per year to care for their child.

'The public education system is literally swamped with children. Any survey of public educators will quickly reveal the suddenness and magnitude of the ASD problem. They lack the therapists and trained special educators to deal with the problem, so children with severe disorders receive nominal meaningful intervention. The further loss of potential future earnings from the ASD children who will likely not be self-supporting is impossibly large to calculate meaningfully. Many parents must quit working to care for the child as well. We, as a nation, are therefore paying and will continue to pay an enormous price for this epidemic.

'ICDRC estimates the minimal cost, in present value, of caring for those 420,000 existing children with autism at US$1,260,000,000,000. So over the next 50 years, a little more than US$1 trillion would be required if we stopped creating new cases today. Because autism is doubling every four years, this is likely an overly conservative estimate. The societal cost could easily be US$3-4 trillion.'

Parents can choose to act now

In her book Children with Starving Brains , McCandless invites parents to visualise the choice of trying alternative treatments or the lack of traditional treatments to standing on a pier while watching their child drown.

'You desperately look for help or a life preserver (a physician or treatments that might work). You find a rope tied to the pier (special diets, nutritional supplements, anti-fungal/anti-viral treatments, secretin, chelation for heavy metal toxicity — all of which you have learned are safe and help many of these children). However, authorities warn you not to use it because it has not been proven that the rope is strong enough (the treatment option has not received final approval by 'authorities' who are waiting for reports of completed scientific studies appearing in peer-reviewed journals). Meanwhile your child is still drowning (exhibiting autistic/ASD symptoms).

'If you were that parent on the pier you wouldn't wait for the completion of the double-blind clinical trials to assure you that that rope is strong enough. You would pick it up and throw it to your child. The worst that could happen is that the rope would break with your child closer to the pier! In real life, numerous parents, some of whom are physicians, have been finding that removing toxic metals is an effective treatment for their children.

'Parents of ASD children cannot afford to wait for approval of the guiding agencies appointed to protect our children's health to try treatment options these agencies consider "alternative medicine", particularly when the "traditional experts" have nothing better to offer. This is especially true as the parents learn that the very actions they dutifully followed on the recommendations of these authoritative agencies may have been the cause of their child's autism, such as accepting the mandate that their newborn be vaccinated with unsafe levels of ethylmercury via the HepB vaccine.

'For the first time in his life my son is telling us that he loves us as much as we love him. In an untreated autistic child this is unheard of,' said Carolyn Yount about her recovering son Chandler. 'For pediatricians to tell parents that there is nothing for them to do is wrong. There is so much we can do.'

Deadly Immunity

Truth Out, 16 June 2005
https://web.archive.org/web/20050619011127/http://www.truthout.org/issues_05/061605HA.shtml

In June 2000, a group of top government scientists and health officials gathered for a meeting at the isolated Simpsonwood conference center in Norcross, Georgia. Convened by the Centers for Disease Control and Prevention, the meeting was held at this Methodist retreat center, nestled in wooded farmland next to the Chattahoochee River, to ensure complete secrecy. The agency had issued no public announcement of the session - only private invitations to fifty-two attendees. There were high-level officials from the CDC and the Food and Drug Administration, the top vaccine specialist from the World Health Organization in Geneva and representatives of every major vaccine manufacturer, including GlaxoSmithKline, Merck, Wyeth and Aventis Pasteur. All of the scientific data under discussion, CDC officials repeatedly reminded the participants, was strictly "embargoed." There would be no making photocopies of documents, no taking papers with them when they left.

The federal officials and industry representatives had assembled to discuss a disturbing new study that raised alarming questions about the safety of a host of common childhood vaccines administered to infants and young children. According to a CDC epidemiologist named Tom Verstraeten, who had analyzed the agency's massive database containing the medical records of 100,000 children, a mercury-based preservative in the vaccines - thimerosal - appeared to be responsible for a dramatic increase in autism and a host of other neurological disorders among children. "I was actually stunned by what I saw," Verstraeten told those assembled at Simpsonwood, citing the staggering number of earlier studies that indicate a link between thimerosal and speech delays, attention-deficit disorder, hyperactivity and autism. Since 1991, when the CDC and the FDA had recommended that three additional vaccines laced with the preservative be given to extremely young infants – in one case, within hours of birth – the estimated number of cases of autism had increased fifteenfold, from one in every 2,500 children to one in 166 children.

Even for scientists and doctors accustomed to confronting issues of life and death, the findings were frightening. "You can play with this all you want," Dr. Bill Weil, a consultant for the American Academy of Pediatrics, told the group. The results "are statistically significant." Dr. Richard Johnston, an immunologist and pediatrician from the University of Colorado whose grandson had been born early on the morning of the meeting's first day, was even more alarmed. "My gut feeling?" he said. "Forgive this personal comment - I do not want my grandson to get a thimerosal-containing vaccine until we know better what is going on."

But instead of taking immediate steps to alert the public and rid the vaccine supply of thimerosal, the officials and executives at Simpsonwood spent most of the next two days discussing how to cover up the damaging data. According to transcripts obtained under the Freedom of Information Act, many at the meeting were concerned about how the damaging revelations about thimerosal would affect the vaccine industry's bottom line. "We are in a bad position from the standpoint of defending any lawsuits," said Dr. Robert Brent, a pediatrician at the Alfred I. duPont Hospital for Children in Delaware. "This will be a resource to our very busy plaintiff attorneys in this country." Dr. Bob Chen,

head of vaccine safety for the CDC, expressed relief that "given the sensitivity of the information, we have been able to keep it out of the hands of, let's say, less responsible hands." Dr. John Clements, vaccines advisor at the World Health Organization, declared that "perhaps this study should not have been done at all." He added that "the research results have to be handled," warning that the study "will be taken by others and will be used in other ways beyond the control of this group."

In fact, the government has proved to be far more adept at handling the damage than at protecting children's health. The CDC paid the Institute of Medicine to conduct a new study to whitewash the risks of thimerosal, ordering researchers to "rule out" the chemical's link to autism. It withheld Verstraeten's findings, even though they had been slated for immediate publication, and told other scientists that his original data had been "lost" and could not be replicated. And to thwart the Freedom of Information Act, it handed its giant database of vaccine records over to a private company, declaring it off-limits to researchers. By the time Verstraeten finally published his study in 2003, he had gone to work for GlaxoSmithKline and reworked his data to bury the link between thimerosal and autism.

Vaccine manufacturers had already begun to phase thimerosal out of injections given to American infants – but they continued to sell off their mercury-based supplies of vaccines until last year. The CDC and FDA gave them a hand, buying up the tainted vaccines for export to developing countries and allowing drug companies to continue using the preservative in some American vaccines – including several pediatric flu shots as well as tetanus boosters routinely given to eleven-year-olds.

The drug companies are also getting help from powerful lawmakers in Washington. Senate Majority Leader Bill Frist, who has received $873,000 in contributions from the pharmaceutical industry, has been working to immunize vaccine makers from liability in 4,200 lawsuits that have been filed by the parents of injured children. On five separate occasions, Frist has tried to seal all of the government's vaccine-related documents – including the Simpsonwood transcripts – and shield Eli Lilly, the developer of thimerosal, from subpoenas. In 2002, the day after Frist quietly slipped a rider known as the "Eli Lilly Protection Act" into a homeland security bill, the company contributed $10,000 to his campaign and bought 5,000 copies of his book on bioterrorism. The measure was repealed by Congress in 2003 – but earlier this year, Frist slipped another provision into an anti-terrorism bill that would deny compensation to children suffering from vaccine-related brain disorders. "The lawsuits are of such magnitude that they could put vaccine producers out of business and limit our capacity to deal with a biological attack by terrorists," says Dean Rosen, health policy adviser to Frist.

Even many conservatives are shocked by the government's effort to cover up the dangers of thimerosal. Rep. Dan Burton, a Republican from Indiana, oversaw a three-year investigation of thimerosal after his grandson was diagnosed with autism. "Thimerosal used as a preservative in vaccines is directly related to the autism epidemic," his House Government Reform Committee concluded in its final report. "This epidemic in all probability may have been prevented or curtailed had the FDA not been asleep at the switch regarding a lack of safety data regarding injected thimerosal, a known neurotoxin." The FDA and other public-health agencies failed to act, the committee added, out of "institutional malfeasance for self protection" and "misplaced protectionism of the pharmaceutical industry."

The story of how government health agencies colluded with Big Pharma to hide the risks of thimerosal from the public is a chilling case study of institutional arrogance, power and greed. I was drawn into the controversy only reluctantly. As an attorney and environmentalist who has spent years working on issues of mercury toxicity, I frequently met mothers of autistic children who were absolutely convinced that their kids had been injured by vaccines. Privately, I was skeptical.

I doubted that autism could be blamed on a single source, and I certainly understood the government's need to reassure parents that vaccinations are safe; the eradication of deadly childhood diseases depends on it. I tended to agree with skeptics like Rep. Henry Waxman, a Democrat from California, who criticized his colleagues on the House Government Reform Committee for leaping to conclusions about autism and vaccinations. "Why should we scare people about immunization," Waxman pointed out at one hearing, "until we know the facts?"

It was only after reading the Simpsonwood transcripts, studying the leading scientific research and talking with many of the nation's pre-eminent authorities on mercury that I became convinced that the link between thimerosal and the epidemic of childhood neurological disorders is real. Five of my own children are members of the Thimerosal Generation -- those born between 1989 and 2003 – who received heavy doses of mercury from vaccines. "The elementary grades are overwhelmed with children who have symptoms of neurological or immune-system damage," Patti White, a school nurse, told the House Government Reform Committee in 1999. "Vaccines are supposed to be making us healthier; however, in twenty-five years of nursing I have never seen so many damaged, sick kids. Something very, very wrong is happening to our children." More than 500,000 kids currently suffer from autism, and pediatricians diagnose more than 40,000 new cases every year. The disease was unknown until 1943, when it was identified and diagnosed among eleven children born in the months after thimerosal was first added to baby vaccines in 1931.

Some skeptics dispute that the rise in autism is caused by thimerosal-tainted vaccinations. They argue that the increase is a result of better diagnosis – a theory that seems questionable at best, given that most of the new cases of autism are clustered within a single generation of children. "If the epidemic is truly an artifact of poor diagnosis," scoffs Dr. Boyd Haley, one of the world's authorities on mercury toxicity, "then where are all the twenty-year-old autistics?" Other researchers point out that Americans are exposed to a greater cumulative "load" of mercury than ever before, from contaminated fish to dental fillings, and suggest that thimerosal in vaccines may be only part of a much larger problem. It's a concern that certainly deserves far more attention than it has received - but it overlooks the fact that the mercury concentrations in vaccines dwarf other sources of exposure to our children.

What is most striking is the lengths to which many of the leading detectives have gone to ignore – and cover up – the evidence against thimerosal. From the very beginning, the scientific case against the mercury additive has been overwhelming. The preservative, which is used to stem fungi and bacterial growth in vaccines, contains ethylmercury, a potent neurotoxin. Truckloads of studies have shown that mercury tends to accumulate in the brains of primates and other animals after they are injected with vaccines – and that the developing brains of infants are particularly susceptible. In 1977, a Russian study found that adults exposed to much lower concentrations of ethylmercury than those given to American children still suffered brain damage years later. Russia banned thimerosal from children's vaccines twenty years ago, and Denmark, Austria, Japan, Great Britain and all the Scandinavian countries have since followed suit.

"You couldn't even construct a study that shows thimerosal is safe," says Haley, who heads the chemistry department at the University of Kentucky. "It's just too darn toxic. If you inject thimerosal into an animal, its brain will sicken. If you apply it to living tissue, the cells die. If you put it in a petri dish, the culture dies. Knowing these things, it would be shocking if one could inject it into an infant without causing damage."

Internal documents reveal that Eli Lilly, which first developed thimerosal, knew from the start that its product could cause damage – and even death – in both animals and humans. In 1930, the company tested thimerosal by administering it to twenty-two patients with terminal meningitis, all of whom died within weeks of being injected – a fact Lilly didn't bother to report in its study declaring thimerosal safe. In 1935, researchers at another vaccine manufacturer, Pittman-Moore, warned Lilly that its claims about thimerosal's safety "did not check with ours." Half the dogs Pittman injected with thimerosal-based vaccines became sick, leading researchers there to declare the preservative "unsatisfactory as a serum intended for use on dogs."

In the decades that followed, the evidence against thimerosal continued to mount. During the Second World War, when the Department of Defense used the preservative in vaccines on soldiers, it required Lilly to label it "poison." In 1967, a study in *Applied Microbiology* found that thimerosal killed mice when added to injected vaccines. Four years later, Lilly's own studies discerned that thimerosal was "toxic to tissue cells" in concentrations as low as one part per million - 100 times weaker than the concentration in a typical vaccine. Even so, the company continued to promote thimerosal as "nontoxic"

and also incorporated it into topical disinfectants. In 1977, ten babies at a Toronto hospital died when an antiseptic preserved with thimerosal was dabbed onto their umbilical cords.

In 1982, the FDA proposed a ban on over-the-counter products that contained thimerosal, and in 1991 the agency considered banning it from animal vaccines. But tragically, that same year, the CDC recommended that infants be injected with a series of mercury-laced vaccines. Newborns would be vaccinated for hepatitis B within twenty-four hours of birth, and two-month-old infants would be immunized for haemophilus influenzae B and diphtheria-tetanus-pertussis.

The drug industry knew the additional vaccines posed a danger. The same year that the CDC approved the new vaccines, Dr. Maurice Hilleman, one of the fathers of Merck's vaccine programs, warned the company that six-month-olds who were administered the shots would suffer dangerous exposure to mercury. He recommended that thimerosal be discontinued, "especially when used on infants and children," noting that the industry knew of nontoxic alternatives. "The best way to go," he added, "is to switch to dispensing the actual vaccines without adding preservatives."

For Merck and other drug companies, however, the obstacle was money. Thimerosal enables the pharmaceutical industry to package vaccines in vials that contain multiple doses, which require additional protection because they are more easily contaminated by multiple needle entries. The larger vials cost half as much to produce as smaller, single-dose vials, making it cheaper for international agencies to distribute them to impoverished regions at risk of epidemics. Faced with this "cost consideration," Merck ignored Hilleman's warnings, and government officials continued to push more and more thimerosal-based vaccines for children. Before 1989, American preschoolers received eleven vaccinations - for polio, diphtheria-tetanus-pertussis and measles-mumps-rubella. A decade later, thanks to federal recommendations, children were receiving a total of twenty-two immunizations by the time they reached first grade.

As the number of vaccines increased, the rate of autism among children exploded. During the 1990s, 40 million children were injected with thimerosal-based vaccines, receiving unprecedented levels of mercury during a period critical for brain development. Despite the well-documented dangers of thimerosal, it appears that no one bothered to add up the cumulative dose of mercury that children would receive from the mandated vaccines. "What took the FDA so long to do the calculations?" Peter Patriarca, director of viral products for the agency, asked in an e-mail to the CDC in 1999. "Why didn't CDC and the advisory bodies do these calculations when they rapidly expanded the childhood immunization schedule?"

But by that time, the damage was done. At two months, when the infant brain is still at a critical stage of development, infants routinely received three inoculations that contained a total of 62.5 micrograms of ethylmercury -- a level 99 times greater than the EPA's limit for daily exposure to methylmercury, a related neurotoxin. Although the vaccine industry insists that ethylmercury poses little danger because it breaks down rapidly and is removed by the body, several studies – including one published in April by the National Institutes of Health – suggest that ethylmercury is actually *more* toxic to developing brains and stays in the brain *longer* than methylmercury.

Officials responsible for childhood immunizations insist that the additional vaccines were necessary to protect infants from disease and that thimerosal is still essential in developing nations, which, they often claim, cannot afford the single-dose vials that don't require a preservative. Dr. Paul Offit, one of CDC's top vaccine advisers, told me, "I think if we really have an influenza pandemic – and certainly we will in the next twenty years, because we always do – there's no way on God's earth that we immunize 280 million people with single-dose vials. There has to be multidose vials."

But while public-health officials may have been well-intentioned, many of those on the CDC advisory committee who backed the additional vaccines had close ties to the industry. Dr. Sam Katz, the committee's chair, was a paid consultant for most of the major vaccine makers and was part of a team that developed the measles vaccine and brought it to licensure in 1963. Dr. Neal Halsey, another committee member, worked as a researcher for the vaccine companies and received honoraria from Abbott Labs for his research on the hepatitis B vaccine.

Indeed, in the tight circle of scientists who work on vaccines, such conflicts of interest are common. Rep. Burton says that the CDC "routinely allows scientists with blatant conflicts of interest to serve on intellectual advisory committees that make recommendations on new vaccines," even though they have "interests in the products and companies for which they are supposed to be providing unbiased oversight." The House Government Reform Committee discovered that four of the eight CDC advisers who approved guidelines for a rotavirus vaccine "had financial ties to the pharmaceutical companies that were developing different versions of the vaccine."

Offit, who shares a patent on one of the vaccines, acknowledged to me that he "would make money" if his vote eventually leads to a marketable product. But he dismissed my suggestion that a scientist's direct financial stake in CDC approval might bias his judgment. "It provides no conflict for me," he insists. "I have simply been informed by the process, not corrupted by it. When I sat around that table, my sole intent was trying to make recommendations that best benefited the children in this country. It's offensive to say that physicians and public-health people are in the pocket of industry and thus are making decisions that they know are unsafe for children. It's just not the way it works."

Other vaccine scientists and regulators gave me similar assurances. Like Offit, they view themselves as enlightened guardians of children's health, proud of their "partnerships" with pharmaceutical companies, immune to the seductions of personal profit, besieged by irrational activists whose anti-vaccine campaigns are endangering children's health. They are often resentful of questioning. "Science," says Offit, "is best left to scientists."

Still, some government officials were alarmed by the apparent conflicts of interest. In his e-mail to CDC administrators in 1999, Paul Patriarca of the FDA blasted federal regulators for failing to adequately scrutinize the danger posed by the added baby vaccines. "I'm not sure there will be an easy way out of the potential perception that the FDA, CDC and immunization-policy bodies may have been asleep at the switch re: thimerosal until now," Patriarca wrote. The close ties between regulatory officials and the pharmaceutical industry, he added, "will also raise questions about various advisory bodies regarding aggressive recommendations for use" of thimerosal in child vaccines.

If federal regulators and government scientists failed to grasp the potential risks of thimerosal over the years, no one could claim ignorance after the secret meeting at Simpsonwood. But rather than conduct more studies to test the link to autism and other forms of brain damage, the CDC placed politics over science. The agency turned its database on childhood vaccines – which had been developed largely at taxpayer expense – over to a private agency, America's Health Insurance Plans, ensuring that it could not be used for additional research. It also instructed the Institute of Medicine, an advisory organization that is part of the National Academy of Sciences, to produce a study debunking the link between thimerosal and brain disorders. The CDC "wants us to declare, well, that these things are pretty safe," Dr. Marie McCormick, who chaired the IOM's Immunization Safety Review Committee, told her fellow researchers when they first met in January 2001. "We are not ever going to come down that [autism] is a true side effect" of thimerosal exposure. According to transcripts of the meeting, the committee's chief staffer, Kathleen Stratton, predicted that the IOM would conclude that the evidence was "inadequate to accept or reject a causal relation" between thimerosal and autism. That, she added, was the result "Walt wants" -- a reference to Dr. Walter Orenstein, director of the National Immunization Program for the CDC.

For those who had devoted their lives to promoting vaccination, the revelations about thimerosal threatened to undermine everything they had worked for. "We've got a dragon by the tail here," said Dr. Michael Kaback, another committee member. "The more negative that [our] presentation is, the less likely people are to use vaccination, immunization -- and we know what the results of that will be. We are kind of caught in a trap. How we work our way out of the trap, I think is the charge."

Even in public, federal officials made it clear that their primary goal in studying thimerosal was to dispel doubts about vaccines. "Four current studies are taking place to rule out the proposed link between autism and thimerosal," Dr. Gordon Douglas, then-director of strategic planning for vaccine

research at the National Institutes of Health, assured a Princeton University gathering in May 2001. "In order to undo the harmful effects of research claiming to link the [measles] vaccine to an elevated risk of autism, we need to conduct and publicize additional studies to assure parents of safety." Douglas formerly served as president of vaccinations for Merck, where he ignored warnings about thimerosal's risks.

In May of last year, the Institute of Medicine issued its final report. Its conclusion: There is no proven link between autism and thimerosal in vaccines. Rather than reviewing the large body of literature describing the toxicity of thimerosal, the report relied on four disastrously flawed epidemiological studies examining European countries, where children received much smaller doses of thimerosal than American kids. It also cited a new version of the Verstraeten study, published in the journal *Pediatrics*, that had been reworked to reduce the link between thimerosal and autism. The new study included children too young to have been diagnosed with autism and overlooked others who showed signs of the disease. The IOM declared the case closed and – in a startling position for a scientific body – recommended that no further research be conducted.

The report may have satisfied the CDC, but it convinced no one. Rep. David Weldon, a Republican physician from Florida who serves on the House Government Reform Committee, attacked the Institute of Medicine, saying it relied on a handful of studies that were "fatally flawed" by "poor design" and failed to represent "all the available scientific and medical research." CDC officials are not interested in an honest search for the truth, Weldon told me, because "an association between vaccines and autism would force them to admit that their policies irreparably damaged thousands of children. Who would want to make that conclusion about themselves?"

Under pressure from Congress and parents, the Institute of Medicine convened another panel to address continuing concerns about the Vaccine Safety Datalink Data Sharing program. In February, the new panel, composed of different scientists, criticized the way the VSD had been used in the Verstraeten study, and urged the CDC to make its vaccine database available to the public.

So far, though, only two scientists have managed to gain access. Dr. Mark Geier, president of the Genetics Center of America, and his son, David, spent a year battling to obtain the medical records from the CDC. Since August 2002, when members of Congress pressured the agency to turn over the data, the Geiers have completed six studies that demonstrate a powerful correlation between thimerosal and neurological damage in children. One study, which compares the cumulative dose of mercury received by children born between 1981 and 1985 with those born between 1990 and 1996, found a "very significant relationship" between autism and vaccines. Another study of educational performance found that kids who received higher doses of thimerosal in vaccines were nearly three times as likely to be diagnosed with autism and more than three times as likely to suffer from speech disorders and mental retardation. Another soon-to-be published study shows that autism rates are in decline following the recent elimination of thimerosal from most vaccines.

As the federal government worked to prevent scientists from studying vaccines, others have stepped in to study the link to autism. In April, reporter Dan Olmsted of UPI undertook one of the more interesting studies himself. Searching for children who had not been exposed to mercury in vaccines – the kind of population that scientists typically use as a "control" in experiments - Olmsted scoured the Amish of Lancaster County, Pennsylvania, who refuse to immunize their infants. Given the national rate of autism, Olmsted calculated that there should be 130 autistics among the Amish. He found only four. One had been exposed to high levels of mercury from a power plant. The other three – including one child adopted from outside the Amish community - had received their vaccines.

At the state level, many officials have also conducted in-depth reviews of thimerosal. While the Institute of Medicine was busy whitewashing the risks, the Iowa legislature was carefully combing through all of the available scientific and biological data. "After three years of review, I became convinced there was sufficient credible research to show a link between mercury and the increased incidences in autism," says state Sen. Ken Veenstra, a Republican who oversaw the investigation.

"The fact that Iowa's 700 percent increase in autism began in the 1990s, right after more and more vaccines were added to the children's vaccine schedules, is solid evidence alone." Last year, Iowa became the first state to ban mercury in vaccines, followed by California. Similar bans are now under consideration in thirty-two other states.

But instead of following suit, the FDA continues to allow manufacturers to include thimerosal in scores of over-the-counter medications as well as steroids and injected collagen. Even more alarming, the government continues to ship vaccines preserved with thimerosal to developing countries – some of which are now experiencing a sudden explosion in autism rates. In China, where the disease was virtually unknown prior to the introduction of thimerosal by U.S. drug manufacturers in 1999, news reports indicate that there are now more than 1.8 million autistics. Although reliable numbers are hard to come by, autistic disorders also appear to be soaring in India, Argentina, Nicaragua and other developing countries that are now using thimerosal-laced vaccines. The World Health Organization continues to insist thimerosal is safe, but it promises to keep the possibility that it is linked to neurological disorders "under review."

I devoted time to study this issue because I believe that this is a moral crisis that must be addressed. If, as the evidence suggests, our public-health authorities knowingly allowed the pharmaceutical industry to poison an entire generation of American children, their actions arguably constitute one of the biggest scandals in the annals of American medicine. "The CDC is guilty of incompetence and gross negligence," says Mark Blaxill, vice president of Safe Minds, a nonprofit organization concerned about the role of mercury in medicines. "The damage caused by vaccine exposure is massive. It's bigger than asbestos, bigger than tobacco, bigger than anything you've ever seen."

It's hard to calculate the damage to our country – and to the international efforts to eradicate epidemic diseases – if Third World nations come to believe that America's most heralded foreign-aid initiative is poisoning their children. It's not difficult to predict how this scenario will be interpreted by America's enemies abroad. The scientists and researchers – many of them sincere, even idealistic – who are participating in efforts to hide the science on thimerosal claim that they are trying to advance the lofty goal of protecting children in developing nations from disease pandemics. They are badly misguided. Their failure to come clean on thimerosal will come back horribly to haunt our country and the world's poorest populations.

Education Matters: Mercury may play autism role

Los Angeles Times, 20 October 2006, 12 AM PT
https://www.latimes.com/socal/glendale-news-press/news/tn-gnp-xpm-2006-10-20-gnp-kimber20-story.html

I suspected that there would be feedback from last week's article about boys and girls. Most of my mail was from the ladies who were either in agreement or were appreciative that a male would even suggest that females should take a more active role in running this world of ours. There were a few grumpy males who took umbrage at the suggestion. One snidely commended me for being in touch with my feminine side; another was sure that I was needing to score a few points with the ladies in my life. While that is a lifelong quest for me, it was not in the offing here.

In trying to figure out why girls in high school and colleges across the nation are out-performing the boys, one of the more thoughtful responses came from Greg, who suggested that our one-size-fits-all education is turning off more and more students, especially the males, for its lack of relevance and its determination to run all students through the same processing mill.

I tend to agree. We should be serving our clientele more as they are and be less hung-up on how we think they should be. By all means let's challenge our kids, but let's also make some effort to find out who and what they are, and how best they might fit into this complicated world. If that means that fewer sonnets and equations and peace treaties are studied, then so be it.

One parent contacted me with another possibility. What she told me was shocking. She writes, "I believe what is happening is that this generation of kids is being exposed to an increasing amount of toxins which have effects that we are just beginning to learn about. I have an autistic son and it is quite possible that his autism is a direct result of vaccines given to him at birth – vaccines that routinely contained mercury."

Just for the record, mercury is the second most toxic substance on earth. Even minute quantities cause harm.

More than 500,000 kids currently suffer from autism, and pediatricians diagnose more than 40,000 new cases every year. The disease was unknown until 1943 when thimerosal, an additive for vaccinations for newborns that contains 50% ethyl mercury, was mixed in with vaccinations given to newborns and young children.

Twyla wrote, "My 14-year-old son received a Hepatitis B vaccination, which contained thimerosal, on the day he was born. This had become routinely recommended for all newborns even though this disease is spread through sexual contact and IV drug use. I guess they felt that they could not trust women to say whether they might be at risk for passing this virus on to the developing fetus, so it was best just to vaccinate all newborns. It did not occur to the powers-that-be that injecting even a tiny amount of mercury into a newborn baby was a very bad idea. And that first shot was only the beginning, as vaccinations continued every few months throughout infancy."

According to [Environmental Protection Agency] standards, the amount of mercury contained in a single vaccination preserved with thimerosal would be considered safe for a 500-pound man. During the 1990s, the number of vaccinations increased dramatically. Nobody in authority thought to add up the amount of mercury being injected into infants, toddlers and children until the turn of the century.

Now lets bring it forward to June 16, 2005. A group of top government scientists and health officials gathered for a meeting in Norcross, Ga. The purpose of this assembly was to study the disturbing questions being raised about the safety of a host of common childhood vaccines administered to infants and young children. According to a Center for Disease Control spokesman, "thimerosal appeared to be responsible for a dramatic increase in autism and a host of other neurological disorders among children, including attention-deficit disorder and hyperactivity.

Since 1991, when the Center for Disease Control and Federal Drug Administration gave their official stamp of approval to thimerosal, the estimated number of cases of autism had increased 15-fold, from one in every 2,500 children to one in 166 children.

Enter Eli Lilly, Merck and a host of other drug companies that knew that thimerosal posed a danger to newborns and yet continued to market it. Their primary concern, you see, was their bottom-line profits. Before 1989, American preschoolers received only three vaccinations – for polio, diphtheria-tetanus-pertussis and measles-mumps-rubella. A decade later, thanks to federal recommendations, children were receiving a total of 22 immunizations by the time they reached first grade. As the number of vaccines increased, the rate of autism among children exploded. Despite the fact that studies over the past several decades indicate that mercury tends to accumulate in the brains of primates and other animals after they are injected with vaccines, and that the brains of infants are particularly susceptible, government agencies that are supposed to protect us from such things were not equal to the task.

U.S. Senate Majority Leader Bill Frist, for example, has received more than $1 million in contributions from the pharmaceutical industry and has worked studiously to immunize vaccine makers from liability in more than 4,200 lawsuits that have been filed by the parents of injured children. (I wonder, are these the "frivolous lawsuits" that our president works so diligently on our behalf to prevent?)

Parents should know what hospitals and doctors are injecting into the bodies of their young children.

Assuming that the makers of human vaccines are legally required to disclose exactly what goes into those vaccines, parents should know if thimerosal is in the mix. Better yet, they should have to sign a paper that contains very large print and a stern warning: This may be extremely hazardous to the health of your child.

Efectos neurotóxicos del timerosal, a dosis de vacuna, obre el encéfalo y el desarrollo en hámsteres de 7 días de nacidos

Anales de la Facultad de Medicina, 2007, September, 68(3): 222-237
https://dialnet.unirioja.es/servlet/articulo?codigo=8403102
http://www.scielo.org.pe/scielo.php?script=sci_arttext&pid=S1025-55832007000300003

Neurotoxic effects of thimerosal at vaccines doses on the encephalon and development in 7 day-old hamsters

Objetivos: Determinar si la administración de timerosal, en cantidades equivalentes al contenido en las vacunas, produce efectos neurotóxicos a nivel encefálico en hámsteres de 7 días de nacidos y evaluar las influencias sobre el desarrollo de los animales de experimentación.

Diseño: Estudio experimental, prospectivo y bietápico.

Lugar: Bioterio de la Facultad de Medicina de San Fernando, Universidad Nacional Mayor de San Marcos.

Material biológico: Hámsteres de 7 días de nacidos.

Métodos: Se estudió 45 hámsteres divididos en tres grupos: grupo A (n = 15), grupo B (n = 15) y grupo C (n = 15). Se administró a los grupos B y C, por vía intramuscular, 3 dosis equivalentes de sucrosa y timerosal, respectivamente, los días 7 (0,227 µg), 9 (0,216 µg) y 11 (0,220 µg) de nacimiento, en un volumen de 20 µL de suero fisiológico. El grupo A solo recibió igual cantidad de suero fisiológico en los mismos días. Principales medidas de resultados: Peso corporal, peso encefálico, talla de los hámsteres y alteraciones histopatológicas encefálicas.

Resultados: Las pruebas Anova y t de student fueron significativas en favor al menor peso corporal, menor peso encefálico y menor talla del grupo C con respecto a los grupos A y B ($p<0,000$). Mediante $\chi 2$, se obtuvo significancia en relación a la presencia de alteraciones histopatológicas en el grupo C ($p<0,000$). El RR de presentar alteraciones fue muy elevado en este grupo.

Conclusiones: La exposición a timerosal, en cantidades equivalentes al contenido en las vacunas, disminuyó de manera significativa el peso corporal, el peso encefálico y la talla de hámsteres posnatales. Asimismo, produjo efectos neurotóxicos a nivel encefálico, encontrándose a nivel del hipocampo (regiones CA1, CA3, DG), corteza cerebral y cerebelo (células de Purkinje y células granulosas) disminución de la densidad neuronal, necrosis neuronal, desmielinización axonal y gliosis; además, el riesgo de presentar alguna de estas alteraciones fue muy elevado en el grupo de animales que recibió timerosal

Neurotoxic effects of thimerosal, at vaccine doses, on the brain and development in 7-day-old hamsters

Anales de la Facultad de Medicina, 2007, September, 68(3): 222-237
https://dialnet.unirioja.es/servlet/articulo?codigo=8403102
http://www.scielo.org.pe/scielo.php?script=sci_arttext&pid=S1025-55832007000300003

Objectives: To determine if thimerosal administration in amounts equivalent to vaccines content produces neurotoxic effects on the encephalon in postnatal hamsters and on experimentation animals' development.

Design: Experimental, prospective, bietapic study. Setting: San Fernando Faculty of Medicine, Universidad Nacional Mayor de San Marcos.

Biologic material: Seven-day old hamsters.

Material: We divided 45 postnatal hamsters in three groups: group A (n = 15), group B (n = 15) and group C (n = 15). We administered three intramuscular equivalent doses of sucrose and thimerosal in 20 µL of physiological serum respectively to groups B and C on birth-days 7 (0,227 µg), 9 (0,216 µg) and 11 (0,220 µg). Group A received only 20 µL of saline solution. Main outcome measures: Body weight, encephalon weight, hamster's stature and encephalon histopathological alterations.

Results: Anova and student t tests showed statistical significance in favor of low body weight, low encephalon weight and smaller stature in group C with respect to groups A and B hamsters ($p<0,000$). $\chi 2$ statistical significance in relation to the presence of histopathological alterations in group C was also obtained ($p<0,000$). We observed greater relative risk of encephalic alterations in group C.

Conclusions: The administration of thime

rosal in doses equivalent to vaccines content was associated with low corporal weight, low encephalon weight and smaller stature in postnatal hamsters. Neurotoxic effects were also produced at encephalic level, at hippocampus (regions CA1, CA3, DG), cerebral cortex and cerebellum (Purkinje cells and granuloses cells) with decrease in neuronal density, neuronal necrosis, axonal dismyelinization and gliosis. In addition, risk increase in developing any of these alterations was high in the animal group receiving thimerosal

A record 130 million Americans are expected to get a flu shot this season in hopes of ducking the nasty virus, but as the needle pierces the skin more than 80% will also get what some say is a hefty and dangerous dose of mercury.

The U.S. Centers for Disease Control and Prevention recommends that almost everyone - including pregnant women - get the injection, despite written warnings from the vaccine manufacturers.

Citing an estimated 36,000 deaths a year from the flu and flu-related illness, the mainstream medical community, including the American Academy of Pediatrics and American Lung Association, says the benefits far exceed any risk from the shot.

In a typical year between 5% and 10% of the population will get the flu virus, resulting in roughly 200,000 hospitalizations, according to the CDC. The flu can be especially dangerous for very young children and people 65 and older. Elderly people account for about 90% of all flu-related deaths.

Simply stated: The flu shot saves lives, the CDC says.

Yet a growing number of doctors, scientists and citizen organizations, such as Safe Minds, the Coalition for Mercury-Free Drugs and Moms Against Mercury, say mercury in flu shots has not been proven to be safe and can be linked to neurological disorders and other serious problems. They push for mercury-free shots that are available in limited quantities but that few know about.

"Mercury causes tremendous damage to the brain," said Paul King, scientific adviser for the Coalition for Mercury-Free Drugs.

Mercury is among the most toxic heavy metals and is known to poison the central nervous system, liver, gastrointestinal tract and other systems in the body.

About 80% of all flu shots distributed in the United States contain a mercury-based preservative called thimerosal. Thimerosal consists of 49.6% ethyl mercury, an anti-bacterial, anti-fungal that allows manufacturers to sell the vaccine in large, multi-dose containers without fear of contamination.

The Environmental Protection Agency and federal Food and Drug Administration have not set an exposure limit for ethyl mercury. The FDA says it's continuing its efforts to reduce the exposure of infants, children and pregnant women to mercury from various sources.

The federal agencies have, however, set exposure limits for another organic and closely related form of mercury, methyl mercury - the type that comes from coal-fired power plants and is found in fish. They use that standard when estimating the safety of ethyl mercury.

Doctors and scientists debate the differences of the two forms in terms of how they affect the brain and body, but all agree: Both are toxins.

"Certainly it would be good to have no mercury exposure at all," said Jeanne Santoli, deputy director of immunization services division for the CDC. "But there's no conclusive scientific evidence that the amount of mercury one might get from a flu shot is linked with any neurological development outcome that's negative."

A typical 0.5 milliliter flu shot contains 25 micrograms - or 50,000 parts per billion - of mercury.
The EPA classifies a liquid with 200 parts per billion of mercury as hazardous waste. The limit for drinking water is 2 parts per billion.

Using the standards set for methyl mercury consumption - the kind that's in fish - an average 130-pound person getting the flu shot would exceed the daily limit by more than four times. A 22-pound baby would get more than 25 times the amount of mercury considered safe. And doctors are recommending that many babies and children get two flu shots this season.

A material safety data sheet from Eli Lilly and Co., which no longer makes a flu vaccine, says effects of exposure to thimerosal may include "fetal changes, decreased offspring survival and lung tissue changes. . . . Exposure in utero and in children may cause mild to severe mental retardation and mild to severe motor coordination impairment."

It does not state at what levels of exposure these consequences could occur.
The sheet is dated Dec. 22, 1999.
That same year, the Public Health Service agencies and American Academy of Pediatrics called for the reduction of thimerosal in all children's vaccines as a "precautionary measure." By 2001 it was eliminated from most vaccines, except for the flu shot. Converting to a preservative-free flu shot would take more time.

Effects uncertain

The CDC and National Institutes of Health have commissioned a number of studies looking at vaccine safety and any links vaccines might have with autism. In 2001 the Institute of Medicine reported that the evidence was inadequate to say whether thimerosal caused autism or other disorders. The issue warranted further investigation, the report stated.

Several other studies followed. In 2004, the Institute of Medicine reported that they couldn't find a causal relationship between thimerosal-containing vaccines and autism.

This September another study published in the New England Journal of Medicine was unable to prove a causal relationship between early exposure to thimerosal and neuropsychological outcomes in children ages 7 to 10. It did not address possible links with autism.

Amid all the uncertainty and considering that mercury is a known neurotoxin, several states, such as California, Illinois and New York, have banned thimerosal in vaccines - including the flu shot - given to young children and pregnant women.

Yet every day, in grocery stores, fast food restaurants, pharmacies, at work and elsewhere, people are bombarded with the message to "Shoo the flu" and repeatedly told "the best way to beat the flu is to get a flu shot."

Nothing is ever mentioned about thimerosal.
Nothing is ever said about the manufacturers' warnings for pregnant women.

In late October the American College of Obstetricians and Gynecologists reminded all pregnant women to get the flu shot.

"Flu vaccination is an essential part of prenatal care that provides protection to both women and their babies," the organization wrote in a press release.

Yet the country's largest maker of the flu vaccine, Sanofi Pasteur, in its own literature distributed in package inserts with the vaccine, specifically states:

"Animal reproduction studies have not been conducted with Influenza Virus Vaccine. It is also not known whether Influenza Virus Vaccine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Influenza Virus Vaccine should be given to a pregnant woman only if clearly needed."

The same warning appears on package inserts for vaccines that do not contain thimerosal.

Other flu vaccine makers include similar warnings in package inserts for both types of flu shots.

Novartis, maker of Fluzone, goes on to instruct that the "clinical judgment of the attending physician should prevail at all times in determining whether to administer the vaccine to a pregnant woman."

Yet physicians aren't present at most flu clinics. So, many, such as Aurora Health Care's Visiting Nurse Association, rely on information from the federal government and medical associations.

"The CDC recommends all pregnant women get them," said Lisa Taylor, a registered nurse and clinical coordinator for Aurora Health Care's Shoo the Flu program, which will vaccinate an estimated 90,000 people around southeastern Wisconsin this season.

The CDC cites one study supporting its claim that the vaccination is safe for pregnant women - a 1973 study designed primarily to look at tumors in children up to 1 year old whose mothers received a polio vaccination. It included a sentence stating that one child of more than 2,000 mothers vaccinated with the flu vaccine had a spinal cord tumor.

"It's ridiculous," said David Ayoub, a physician and medical director of Springfield, Ill.-based Prairie Collaborative for Immunization Safety, a group concerned about mercury in vaccinations. "It's a big, big deception.

"Half the kids could have died, but the study never would have shown that because they were specifically looking for tumors," said Ayoub, co-author of "Influenza Vaccination During Pregnancy: A Critical Assessment of the Recommendations of the Advisory Committee on Immunization Practices," published in the Journal of American Physicians and Surgeons in 2006.

Still the CDC defends the study, calling it "relevant" and says other studies also demonstrate the vaccine's safety during pregnancy.
"If there was any evidence that this is unsafe in pregnancy, it's likely the (CDC's advisory committee) would not be recommending it," said Anthony Fiore, a medical epidemiologist with the CDC. "It's a vaccine that's been given to pregnant women for decades."

Fiore also acknowledged that not enough is known about its safety.

"We would love to have better data on flu vaccine safety in all types of persons," he said.

Grass-roots groups, such as the North Carolina-based Moms Against Mercury, say it is just that lack of data that stokes their opposition to mercury-laden inoculations recommended for the masses.

"They are putting out a lot of false information about its safety," said Amy Carson, founder of the non-profit group.

Some thimerosal-free

Vaccine manufacturers such as Sanofi Pasteur, MedImmune and Novartis say they're ramping up production of thimerosal-free vaccines but don't have capacity to convert all the flu shots immediately.

"Our ultimate goal is to be entirely (preservative)-free," said Sanofi Pasteur spokeswoman Patricia Tomsky. "But it takes more time and effort to make single doses."

A thimerosal-free vaccine costs roughly $3 to $4 more per shot, Tomsky said.

The Wisconsin Department of Health and Human Services said about one third of its supply this flu season will be thimerosal-free. People need to ask for it, if they want it, health officials say.

But many people aren't aware that mercury is in the flu shot.

"I didn't know," said Kate Strzok, a 23-year-old Oak Creek woman, as she walked out of the Piggly Wiggly where she had just gotten the flu shot. "Interesting that they don't tell you."

Journal of Toxicology and Environmental Health

Geier DA, Sykes LK, Geier MR.

A review of Thimerosal (Merthiolate) and its ethylmercury breakdown product: specific historical considerations regarding safety and effectiveness

J Toxicol Environ Health B Crit Rev. 2007, December, 10(8): 575-96
doi: 10.1080/10937400701389875.
https://pubmed.ncbi.nlm.nih.gov/18049924/ https://www.tandfonline.com/doi/full/10.1080/10937400701389875

Thimerosal (Merthiolate) is an ethylmercury-containing pharmaceutical compound that is 49.55% mercury and that was developed in 1927. Thimerosal has been marketed as an antimicrobial agent in a range of products, including topical antiseptic solutions and antiseptic ointments for treating cuts, nasal sprays, eye solutions, vaginal spermicides, diaper rash treatments, and perhaps most importantly as a preservative in vaccines and other injectable biological products, including Rho(D)-immune globulin preparations, despite evidence, dating to the early 1930s, indicating Thimerosal to be potentially hazardous to humans and ineffective as an antimicrobial agent. Despite this, Thimerosal was not scrutinized as part of U.S. pharmaceutical products until the 1980s, when the U.S. Food and Drug Administration finally recognized its demonstrated ineffectiveness and toxicity in topical pharmaceutical products, and began to eliminate it from these. Ironically, while Thimerosal was being eliminated from topicals, it was becoming more and more ubiquitous in the recommended immunization schedule for infants and pregnant women.

Furthermore, Thimerosal continues to be administered, as part of mandated immunizations and other pharmaceutical products, in the United States and globally. The ubiquitous and largely unchecked place of Thimerosal in pharmaceuticals, therefore, represents a medical crisis.

...

Conclusion

The high order of toxicity from Thimerosal and its ethylmercury breakdown product has been known and published for decades. Nonetheless, Thimerosal remains in the drug supply, especially in various vaccines manufactured both for the United States and globally. The ubiquitous and largely unchecked place of Thimerosal in pharmaceutical products, therefore, represents a medical crisis in the modern day. Reforms in the manufacture and the licensing of vaccines and other drugs, which should have been accomplished proactively, had anyone properly assessed their mercury content, must now be conducted, reactively, under significant systemic stress. With no warning, recall, or ban of mercury in vaccines and other drugs as of yet, the victim of this mandated, unwarranted, and massive mercury exposure is still an unsuspecting public, and most especially its unborn and newborn children.

Mercury and Vaccines (Thimerosal)

CDC, 8 February 2008
https://web.archive.org/web/20090925160838/http://www.cdc.gov/vaccinesafety/updates/thimerosal.htm

Thimerosal is a mercury-containing preservative used in some vaccines and other products since the 1930s. There is no convincing scientific evidence of harm caused by the low doses of thimerosal in vaccines, except for minor reactions like redness and swelling at the injection site. However, in July 1999, the Public Health Service agencies, the American Academy of Pediatrics, and vaccine manufacturers agreed that thimerosal *should be reduced or eliminated in vaccines* as a precautionary measure.

Since 2001, with the exception of some influenza (flu) vaccines, thimerosal is not used as a preservative in routinely recommended childhood vaccines.

For more information, please see *Infant and Environmental Exposures to Thimerosal and Neuropsychological Outcomes at Ages 7 to 10 Years.* [See: CDC, 24 September 2008]

CDC Statement on Autism and Thimerosal

As the country's leading public health agency, the Centers for Disease Control and Prevention (CDC) is committed to protecting the health of all Americans – including infants, children, and adolescents. CDC shares with parents and many others great concern about the number of children with autism spectrum disorders (ASD). We are committed to understanding what causes autism, how it can be prevented, and how it can be recognized and treated as early as possible.

Recent estimates from CDC's Autism and Developmental Disabilities Monitoring network found that about 1 in 150 children have an ASD. This estimate is higher than estimates from the early 1990s. Some people believe increased exposure to thimerosal (from the addition of important new vaccines recommended for children) explains the higher prevalence in recent years. However, evidence from several studies examining trends in vaccine use and changes in autism frequency does not support such an association. Furthermore, a scientific review* by the Institute of Medicine (IOM) concluded that "the evidence favors rejection of a causal relationship between thimerosal-containing vaccines and autism." CDC supports the IOM conclusion.

CDC recognizes that autism is an urgent health concern and supports comprehensive research as our best hope for understanding the causes of autism and other developmental disorders. Through collaborations with partners in government, research centers, and the public, CDC is focusing on three areas –

1. Understanding the frequency and trends of autism spectrum disorders.
2. Advancing research in the search for causes and effective treatments.
3. Improving early detection and diagnosis so affected children are treated as soon as possible.

BLISSTREE

Kristina Chew

Dr. Marie McCormick Subpoenaed

Blisstree, 18 April 2008

https://web.archive.org/web/20170301230535/http://www.blisstree.com/2008/04/18/mental-health-well-being/dr-marie-mccormick-subpoenaed/

What causes autism is a question to be answered by science, or so one would think rather than by, for instance, any legal decisions or court cases. Just in the past year, there have been more and more studies refuting a link between the MMR vaccine and autism and also between thimerosal and rising autism rates. More and more studies are being done that point to a complex web of genetic factors in autism. Nonetheless, legal decisions in cases involving an autistic child and claims of injury by a vaccine, as in the cases of Michelle Cedillo (whose case was brought before the "vaccine court" in June of 2007) and Hannah Poling, have continued to attract the attention of the public, and to shift attention onto the safety of vaccines, over and above the need to take care of and educate autistic children and adults.

At end of March, Kathleen Seidel, who administers the well-researched Neurodiversity website, was issued a subpoena commanding her "to appear for deposition and document production in Rev. Lisa Sykes and Seth Sykes' $20,000,000 personal injury lawsuit, Sykes v. Bayer (Case No. 3:07-CV-660, Eastern District of Virginia, Richmond Division)." Seidel has written carefully researched articles about a hypothetical vaccine-autism link and has offered cogent, well-documented critiques of biomedical research. This is her Motion to Quash the subpoena, which requested that she hand over "virtually the entire documentary record of my intellectual and financial life over the past four years." Many bloggers have spoken out in support of Seidel; here is a list.

Today Seidel noted that she is "in distinguished company." I quote from her:

Yesterday I learned that on March 26, 2008 ……. Dr. Marie McCormick, Sumner and Esther Feldberg Professor of Maternal and Child Health at the Harvard School of Public Health, and Professor of Pediatrics at Harvard Medical School, was subjected to a similar experience at her Massachusetts home.

From 2001 to 2004, Dr. McCormick chaired the Immunization Safety Review Committee of the Institute of Medicine (IOM), charged with analyzing and reporting on data regarding the safety of vaccination practices. During her tenure, the committee published numerous reports of its findings, now made freely available on the National Academy of Sciences website. In its 2001 report, Measles-Mumps-Rubella Vaccine and Autism, the committee concluded that existing studies provided no support for an association on a population level between MMR immunization and autistic spectrum conditions. Vaccines and Autism, issued in May 2004, concluded that currently-available evidence favored a rejection of a causal relationship of thimerosal-containing vaccines and autism.

As a result of her voluntary work on the committee, Dr. McCormick has found herself a frequent target of suspicion by plaintiffs, their attorneys and advocates, and opponents of vaccines, who disagree with the committee's conclusions, and whose legal and political positions are not supported by its reports. Now she, too, is the target of a subpoena in Sykes v. Bayer.

The subpoena was issued against Dr. McCormick on March 21 by Clifford Shoemaker, and commands her to appear for deposition on April 29 at the Boston offices of vaccine-injury litigators Conway, Homer & Chin-Caplan.

Clifford Shoemaker is a lawyer who has represented more than a few families who claim that their child was "injured" by a vaccine and became autistic; he is the lawyer for the family of Hannah Poling. A Motion to Quash the Subpoena has been filed on behalf of Dr. McCormick. More from Kathleen Seidel:

The Motion (assigned docket number 1:2008-mc-10102) indicates that although Dr. McCormick was served on March 26, and although her attorneys tried repeatedly to contact plaintiffs' counsel to discuss the matter and to attempt in good faith to resolve or narrow the issue, Mr. Shoemaker did not respond until April 9 — the deadline for filing a motion to quash.

The Memorandum of Law in Support of Motion to Quash Third-Party Subpoena addresses the governance of the National Academy of Sciences, the processes by which its committees conduct and publish scientific studies and investigations, and the manner in which it screens committee members for conflicts of interest. It protests the subpoena as unduly burdensome and premature, particularly given the substantive and procedural flaws in the Amended Complaint recently filed in Sykes v. Bayer. The Memorandum discusses the legal rationale for and public policy interests served by preserving confidentiality of IOM committee deliberations reflecting "preliminary, incorrect, or incomplete analysis" of scientific matters, and previous attempts to compel discovery of such material. The Memorandum also addresses the inappropriateness of issuing the subpoena to Dr. McCormick personally, and protests its burdensome demands for material readily available from public sources and its personally invasive character.

Seidel notes that she is in "solidarity and sympathy" with Dr. McCormick, and I am too. It is unfortunate that, rather than let theories about autism causation be studied and determined by scientists and researchers, some have chosen such avenues and tactics – especially when there are so many other issues about autism that need our attention and resources.

Protecting Children from Mercury-Containing Drugs

United Methodist Church, Fort Worth. 23 April – May 2, 2008
https://calms2008.umc.org/Text.aspx@mode=Petition%26Number=409.html
https://pathwaystofamilywellness.org/wellness-lifestyle/the-united-methodist-church-resolves-to-protect-children-from-mercury-in-drugs.html

Policy Base: The United Methodist Social Principles, 162.J (Alcohol and Other Drugs), 162.T (Right to Health Care)

Theological Foundation: In Mark 10:13-16, it says, "People were bringing little children to him in order that he might touch them; and the disciples spoke sternly to them. But when Jesus saw this, he was indignant and said to them, 'Let the little children come to me; do not stop them; for it is to such as these that the Kingdom of God belongs. Truly I tell you, whoever does not receive the kingdom of God as a little child will never enter it.' And he took them up in his arms, laid his hands on them, and blessed them."

Photo by Mike DuBose

When the 2008 General Conference of The United Methodist Church, meeting in Fort Worth, Texas, approved the resolution "Protecting Children from Mercury-containing Drugs" on April 29th, it brought a new and commanding voice to the issue of mercury in medicine. Comprised of 992 international delegates, the General Conference is the top decision-making body of the United Methodist Church. In passing this resolution, the United Methodist Church affirms its commitment to safe vaccines and seeks to safeguard public confidence in vaccines and other drugs by advocating the removal of mercury from them.

Mercury is a known poison, neurotoxin, and carcinogen. Of particular concern, thimerosal, the mercury-based 'preservative' first patented in 1928, remains commonplace in some vaccines (including flu and tetanus shots) as well as other drugs, both prescription and over-the-counter, used in the United States and abroad. With many published scientific, medical, toxicological, and epidemiological studies (some underwritten by pharmaceutical companies and government agencies) reaching opposite conclusions about the danger posed by mercury in the global drug

Delegates to the 2008 United Methodist General Conference meeting

Whereas, as demonstrated in the Social Principles, The United Methodist Church affirms:

"...wise policies relating to the availability of potentially beneficial or potentially damaging prescription and over-the-counter drugs; we urge that complete information about their use and misuse be readily available to both doctor and patient."

Whereas, Thimerosal (synonyms include: Thiomseral, Merthiolate, Thimerasol) is a severely toxic, antiquated, organic mercury compound (approximately 50% mercury by weight) that has been added to some vaccines and pharmaceutical products since the 1930s,

Whereas, numerous peer-reviewed scientific/medical studies published over many decades, at least since the 1930s, have recommended removing or restricting the use of Thimerasol in medicinal products, and have demonstrated its significant toxicity,

Whereas, the Food and Drug Administration (FDA) recommended, in 1982, that Thimerosal be banned from topical over-the-counter products, and the American Academy of Pediatrics (AAP) and United States Public Health Service called for its removal from all vaccines in July of 1999, as did the Institute of Medicine of the United States National Academy of Sciences in 2001,

Whereas, Thimerasol (mercury) still remains in some vaccines (including childhood vaccines and the flu shot), and many other pharmaceutical products in the US, and the mercury content of vaccines manufactured for use in developing nations has not been reduced, and in both cases, remains well in excess of Federal Safety Guidelines,

Whereas, the Environmental Protection Agency of the State of California officially declared that Thimerasol is a developmental toxin, meaning that it can cause birth defects, low birth weight, biological dysfunctions, or psychological or behavior deficits that become manifest as the child grows, and that maternal exposure during pregnancy can disrupt the development or even cause the death of the fetus (The State of California has banned administration of Thimerasol-containing vaccines to children and pregnant women),

Whereas, the public is given limited opportunity of informed consent in regard to these known risks of mercury exposure incurred through mandated injections and from many other pharmaceutical products, both prescription and over-the-counter, including topical antiseptic solutions and antiseptic ointments for treating cuts, nasal sprays, eye solutions, vaginal spermicides, diaper rash treatments, and perhaps most importantly, as a preservative in vaccines and other injectable biological products, including immune globulin preparations.

Whereas, vaccines are promoted for the prevention of diseases, it is also important to guard against any unintentional harm through their administration. It is a violation of human life to inject poison into any being, especially a pregnant woman or a newborn baby,

Whereas, there are some presently marked vaccines and pharmaceutical products that use safe, effective, and economical methods to eliminate the need for Thimerosal (mercury) preservatives, thereby increasing the safety of vaccines,

Therefore, be it resolved that The United Methodist Church support all efforts to protect the public, especially children, from mercury-containing drugs by calling on the World Health Organization, international and national health officials/agencies, including the US Secretary of Health and Human Services, the US Food and Drug Administration and the US Centers for Disease Control and Prevention to:

Immediately prioritize *mercury-free stocks of vaccines* and other pharmaceutical products for pregnant women, newborn infants and children,

Provide “the opportunity of informed consent” and promote product education to individuals about mercury exposure through their pharmaceutical products or vaccines, detailing the known risks of toxicity and Federal Safety Guidelines for exposure to mercury; and

Ban the presence of any mercury compound in pharmaceutical products or vaccines, prescribed or over-the-counter.

And be it further resolved, that, until mercury is banned from medicine, the medical missions, hospitals, clinics and ministries of The United Methodist Church strongly encourage mercury-free vaccines over mercury-containing ones. Acknowledging the difficulties in some contexts, we strongly urge that other organizations who are responsible for immunization efforts to prevent disease such as the Global Alliance for Vaccines and Immunizations, United Nations Children’s Fund (UNICEF), Rotary International, the Bill and Melinda Gates Foundation as well as any other organization from which vaccines are purchased join the United Methodist Church in the education of and advocating for mercury free drugs and vaccines.

pathways to family wellness

The United Methodist Church Resolves **to Protect Children from Mercury in Drugs**

Pathways, Spring, 2009
https://pathwaystofamilywellness.org/wellness-lifestyle/the-united-methodist-church-resolves-to-protect-children-from-mercury-in-drugs.html

When the 2008 General Conference of The United Methodist Church, meeting in Fort Worth, Texas, approved the resolution "*Protecting Children from Mercury-containing Drugs*" on April 29th, it brought a new and commanding voice to the issue of mercury in medicine. Comprised of 992 international delegates, the General Conference is the top decision-making body of the United Methodist Church. In passing this resolution, the United Methodist Church affirms its commitment to safe vaccines and seeks to safeguard public confidence in vaccines and other drugs by advocating the removal of mercury from them.

Mercury is a known poison, neurotoxin, and carcinogen. Of particular concern, thimerosal, the mercury-based 'preservative' first patented in 1928, remains commonplace in some vaccines (including flu and tetanus shots) as well as other drugs, both prescription and over-the-counter, used in the United States and abroad. With many published scientific, medical, toxicological, and epidemiological studies (some underwritten by pharmaceutical companies and government agencies) reaching opposite conclusions about the danger posed by mercury in the global drug supply, the United Methodist resolution brings a new religious and ethical perspective to this debate even as it brings this issue to the attention of a global community of concerned Christians.

With its passage, The United Methodist Church, with 11.5 million members around the world, becomes the largest global organization and the first faith community to advocate for mercury- free drugs. Because The United Methodist Church has a network of medical missions, clinics, and hospitals around the world, its leadership hopes that their expressed preference for mercury-free vaccines will cause other agencies involved in the delivery of healthcare, both in the United States and around the world, to examine this issue with great care. Early efforts, first led by the Rev. Lisa Sykes and other parents of mercury-injured children, brought their well-researched concerns about mercury in medicine to the attention of their local churches and annual conferences. Ms. Julie Taylor, Executive Secretary for Children, Youth, and Family Advocacy, within the Women's Division, explained:

"As part of its history, the organization of United Methodist Women has advocated for the health and education of women and children. Because of their faith and since the turn of the century, the women have sought to raise awareness and provide assistance for these areas of concern, both in this country and around the world. Undertaking the issue of mercury in vaccines and other drugs is just one expression of that faith and commitment. Today's women are advocating for safe vaccines. They want children to be protected from diseases but they also want that to occur in as safe a manner as possible. Getting mercury out of vaccines is one way to do that."

A number of factors underscore why this issue has ascended through the structures of The United Methodist Church so quickly. The first is that this issue is consistent with both the history and the doctrine of the denomination. Affirmed in the United Methodist Book of Discipline is the church's great commitment to social justice: "The United Methodist Church has a long history of concern for social justice. Its members have often taken forthright positions on controversial issues involving Christian principles. Early Methodists expressed their opposition to the slave trade, to smuggling, and to the cruel treatment of prisoners."

THE FLU CASE

Ulla Danielsen

Methodist minister challenges US Government over toxic Mercury in Vaccines

The Flu Case, 1 February 2010, 15:34
https://web.archive.org/web/20100415040848/http://www.theflucase.com/index.php?option=com_content&view=article&id=2668%3Amethodist-minister-challenges-us-government-over-toxic-mercury-in-vaccines&catid=1%3Alatest-news&Itemid=64&lang=en

"*When you take something Deadly and put it in something Lifesaving, does that make the deadly thing safe, or the lifesaving thing deadly*?" Asks Reverend Lisa K. Sykes, Richmond, Virginia

The first years of his life, Lisa Sykes' newborn son, whom she named Wesley, appeared to be a normal, healthy child. He was born in Richmond, Virginia, in 1996. As an American child, Wesley received all of the vaccines required by the state of Virginia through his second birthday. The doctor assured Lisa the shots her son received were essential and safe.

In his baby photos, Wesley is smiling and appears very healthy. Yet, by his third birthday, something terrible had happened to Wesley. It is noticeable in the pictures. His eyes were no longer vivid and his angelic little smile has vanished. About this time, Wesley also lost all his words and acted as if he were deaf. Even when Lisa screamed out his name loudly, Wesley would not look at her or respond to her.

Lisa K. Sykes,

Who is a Methodist minister in Richmond, Virginia, began seeking help for her son.

Diagnosed with Autism

The doctors diagnosed Wesley with autism, and afterwards he was tested for heavy metal poisoning.

The test results proved that Wesley had levels of *mercury in his urine well above the danger limit*.

For Lisa K. Sykes it was crushing, when she learned that most of the vaccines which her son had received as a toddler as well as one shot she had received during her pregnancy, all contained mercury, which at very low levels is a documented and potent poison, carcinogen and neurotoxin. "Neither my doctor nor I knew, that there was mercury present in these pharmaceutical products, containing an antiquated preservative by the name of Thiomersal," says Sykes.

She raised the issue first in the Virginia Annual Conference of the United Methodist Church, and then before the Women's Division of the General Board of Global Ministries of her denomination. The alarmed mother and minister succeeded in getting first her conference and then the Women's Division of the United Methodist Church to support her fight for *mercury-free vaccines*. Finally, on April 29, 2008, Lisa K. Sykes experienced an even greater victory, when the General Conference of the United Methodist Church, representing 11 million members world-wide, approved her resolution, "*Protecting Children from Mercury-containing Drugs*."

A Direct Connection

Lisa K. Sykes, who is now 44 years of age, is convinced that there is a direct connection between the increasing frequency of autism among US children and the increasing amount of mercury being administered to them through vaccines containing Thiomersal.

And she is not the only one to suspect such a connection.

Scientists from John Hopkins, Columbia, Tufts, Baylor and other prestigious institutions also *find evidence that supports this point of view*.

Dr. Mark Geier, President for The Genetic Centers of America, writes that a lowering burden of mercury in the vaccination programme in 2003, resulted in a falling rate in the diagnosis of developmental disorders three years later.

Meanwhile these disorders are expected to increase again, as Thiomersal has begun to reappear in newer vaccines, especially those for the seasonal and swine flu. "When you take something *deadly and put it into something life-saving*, does that make the deadly thing safe, or the lifesaving thing deadly?" asks Reverend Lisa K. Sykes.

Not only a Medical Crisis

Sykes emphasizes that she was denied both safe pharmaceuticals and informed consent. "That makes this issue not only a medical crisis - but also a crisis of civil rights, and some would say constitutional rights," the Methodist minister asserts.

For Christians the matter has become a moral and ethical issue, as many developing countries have keyed their laws to laws in the US, after they have been made victims of unsafe and cheap pharmaceutical products.

"Industry fears that if the USA bans Thiomersal, other countries will also, closing huge markets to unsafe mercury-preserved vaccines," Lisa K. Sykes argues. "In the face of federal inertia on this public health crisis, it is the faith community that is taking a decisive stand," she says.

The United Methodist Church is the first community of faith to officially advocate a ban on the use of mercury in pharmaceuticals – including Thiomersal in vaccines.

The bold step of the Methodists is a challenge to the American government, the American Medical Association, the American Academy of Pediatrics as well as the producers of vaccines, who to this day, still protest that the use of mercury in pharmaceutical products, even for pregnant women and newborn children, is safe.

Mercury Exports to be Banned on Health Grounds by EU

MedIndia, 25 September 2008
https://www.medindia.net/news/mercury-exports-to-be-banned-on-health-grounds-by-eu-42282-1.htm

The export of mercury will be banned in the European Union from 2011 in order to reduce health risks, the European Commission announced Thursday.

The European Commission announced Thursday that the export of mercury will be banned in the European Union from 2011 in order to reduce health risks.

Alongside the ban, which includes mixtures of metallic mercury with other substances, the new rules to be introduced in March 2011 will oblige all mercury already in Europe to be "safely stored" so as not to cause a hazard.

"Mercury poses a threat to human health and the environment in the European Union and globally," said EU Environment Commissioner Stavros Dimas.

"This important piece of legislation will protect citizens by significantly reducing exposure to this highly toxic metal.

"Let us hope that other countries will follow our example," he added.

A commission spokeswoman said that the 27 EU member states would in January consider whether a ban on mercury imports is also required.

The EU ended all mercury extraction in 2001 but remains the world's biggest exporter, supplying around a quarter of global consumption of mercury.

Mercury and its compounds are highly toxic to humans and high does can be fatal.

The use of mercury is declining worldwide but it is still used in small-scale gold mining, the chlor-alkali industry and production of vinyl-chloride monomer, the basis of PVC plastic.

It has also been used in dental amalgam for fillings.

EU Monitor

Environment:
Commission welcomes adoption of legislation to ban EU mercury exports

EU Monitor, 25 September 2008.
https://www.eumonitor.eu/9353000/1/j9vvik7m1c3gyxp/vhymhg01bszz?ctx=vi8rm2zxslzp&s0e=vhdubxdwqrzw
https://web.archive.org/web/20100220012632/http://www.theflucase.com/index.php?option=com_content&view=article&id=2578%3Aeu-acknowledged-health-risks-of-mercury-in-2008&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The European Commission welcomes the final adoption by the Council today of legislation banning all exports of mercury from the European Union. The export ban is a key part of the EU's strategy for reducing the global supply of mercury and thereby limiting emissions of the highly toxic heavy metal into the environment. The legislation requires mercury that is no longer used in the chlor-alkali industry – the chemical industry sector responsible for chlorine and caustic soda production – or that is produced in certain other industrial operations, to be put into safe storage once the export ban takes effect in March 2011.

Environment Commissioner Stavros Dimas said: *"Mercury poses a threat to human health and the environment in the European Union and globally. This important piece of legislation will protect citizens by significantly reducing exposure to this highly toxic metal. Let us hope that other countries will follow our example and support our goal of cutting the global supply of this dangerous substance."*

Dangers of mercury exposure

Mercury and its compounds are highly toxic to humans, animals and ecosystems. High doses can be fatal to humans, but even relatively low doses can seriously affect the nervous system and have been linked with possible harmful effects on the cardiovascular, immune and reproductive systems. Mercury persists in the environment, where it can change into methylmercury, its most toxic form. Methylmercury readily passes through both the placenta and the blood-brain barrier, so exposure of women of child-bearing age and of children is of greatest concern.

Mercury use

Use of mercury is declining at both global and EU levels. Yet some significant uses remain. Globally, the main uses of mercury are in small-scale gold mining, the chlor-alkali industry and production of vinyl-chloride monomer, the basis of PVC plastic. In the EU only the chlor-alkali industry remains a significant user, and it is progressively phasing out the use of mercury-containing cells in its production of chlorine. The next most significant use in the EU is in dental amalgam.

EU mercury exports

Although the EU stopped all forms of mercury mining in 2001, it is the world's biggest exporter – responsible for up to a quarter of the global mercury supply. The new legislation is designed to ensure that several thousand tonnes of mercury will be taken out of circulation and stored in a way preventing its release. Euro Chlor, a federation representing the European chlor-alkali manufacturing industry, has made a voluntary commitment to ensure safe storage of mercury from the industry and compliance with all relevant national and EU legislation.

Background

The Commission launched the EU's mercury strategy – a comprehensive plan addressing mercury pollution both in the EU and globally – in January 2005. It consists of 20 measures to reduce mercury emissions, cut supply and demand and protect against exposure, especially to methylmercury found in fish. The export ban and safe storage of surplus mercury are major aspects of the strategy.

WORLD NEWS

EU to ban export of mercury by 2011 on health grounds

World News, 29 September 2008
https://web.archive.org/web/20080929100554/https://article.wn.com/view/2008/09/25/EU_to_ban_export_of_mercury_by_2011_on_health_grounds/

BRUSSELS - The export of mercury will be banned in the European Union from 2011 in order to reduce health risks, the European Commission announced Thursday. Alongside the ban, which includes mixtures of metallic mercury with other substances, the new rules to be introduced in March 2011 will oblige all mercury already in Europe to be "safely stored" so as not to cause a hazard. Stomping Through a Medical Minefield

Newsweek / AUCD, 27 October 2008 // 3 November 2008
https://www.aucd.org/template/news.cfm?news_id=3200&id=1284&parent=1284

Paul Offit-salt-and-pepper hair, wire-rimmed glasses, Phillies fan-hardly seems like the kind of guy who'd receive a death threat. He's a father who likes to hang out with his teenage kids, a doctor who wears khakis until they're frayed. But Offit, chief of infectious diseases at Children's Hospital of Philadelphia and the nation's most outspoken advocate for childhood immunizations, is at the center of a white-hot medical controversy. He believes passionately in the safety of vaccines; his enemies, many of them parents who blame these shots for their children's autism, do not. Offit says he's been harassed in public, and received threatening letters, e-mails, and phone calls. One August morning, his wife, Bonnie, sent him a message before he spoke at a New York press conference promoting vaccination. Worried that protesters rallying outside the event might turn violent, she warned: "Be careful."

Immunologists were hardly the target of such wrath when Offit, 57, entered the field almost 30 years ago. But today, frustrations and fears about a mysterious brain disorder that strikes up to one in 150 kids have given rise to the most angry and divisive debate in medicine: do vaccines trigger autism? Offit, a vaccine inventor, says "no." His critics, who vilify him routinely on autism Web sites, say the question is still very much open. They think he's arrogant and a mouthpiece for Big Pharma. One recent post: "Offit should be prosecuted for crimes against our children." After the death threat – a man wrote, "I will hang you by your neck until you are dead" – an armed guard followed Offit to lunch during meetings at the Centers for Disease Control and Prevention.

But the scientist refuses to back down. In his new book, "Autism's False Prophets: Bad Science, Risky Medicine, and the Search for a Cure," Offit takes on his critics full-force, challenging them to prove the science wrong. Fearing for his safety, he isn't doing a book tour. "People think of me as this wild-eyed maniac," Offit says. "If I sat down with them for 10 minutes, they'd see that my motivation is the same as theirs. You want what's best for kids." Asked how he ranks the intensity of the vitriol aimed at him, Offit says simply, "Abortion, doctors who perform abortions."

Nobody's firebombing pediatricians' offices, and there's no moral dilemma here about when life begins. But the overarching question – what happened to my baby?--is still impossible to answer, and the anger is real and it's deep. Some parents of children with autism tell stories with an eerily similar start: an infant who was happy and healthy until she got her shots. Then, suddenly, she lost eye contact and language. Parents' dreams for their babies are buried in sadness, their pockets are emptied to pay for therapies, their worries about their children's future haunt them even as they're trying to get through the screaming, splattered minutes of the day.

Parents of children with autism are a diverse group. Many don't believe vaccines are to blame; they'd like to see attention shifted to better services for their children. But those who think vaccines are the culprit will continue to fight a government and pharmaceutical industry they do not trust. Such concerns have spread beyond the autism community. Choice has become a critical issue; a few weeks ago, parents rallied outside the New Jersey State House, protesting the state's requirement that the flu vaccine be given to children attending day care or preschool. (The parents support

legislation that would let them opt out.) A recent CDC survey found that less than 1 percent of American toddlers received no vaccines at all by 19 to 35 months. But some parents are skipping certain shots or staggering the government's recommended schedule, a move that scientists worry could lead to increased outbreaks. This summer, the CDC reported 131 cases of measles, the largest number since 1996. Many of those kids' parents, says a CDC spokesman, were concerned about vaccine safety.

Offit's book is a critical assessment of the theories that have swirled around autism, the therapies marketed to fix it, and the people – the "false prophets" - who he says have taken emotional and financial advantage of parents seeking a cure. Few scientists are willing to touch this third rail of science publicly; Offit grabs it with two hands. He documents "false promises," like secretin, a hormone derived from pigs that was said to improve symptoms. He dissects hypotheses that gave rise to fears – first, that the measles-mumps-rubella vaccine causes autism and later, that thimerosal, a mercury-containing preservative, is the culprit – then lays out the evidence against them, including more than a dozen studies showing no link. He lambastes the lawyers, doctors, media, politicians, and celebrities who he says have fueled the anxiety. The notion that vaccines cause autism, he writes, has "been clearly disproved."

...

Recently, Offit set off a flurry of angry postings when he said that a *baby's immune system could handle as many as 10,000 vaccines*. Then he upped the ante, saying it was probably "*closer to 100,000*." Offit's assessment is based on data showing the vast capacity of a child's immunological response. Parents who worry that children are getting too many shots too soon (the CDC schedule calls for about 28 immunizations against 14 diseases by age 2) were incensed. "Let's see how many of these vaccinations Offit can withstand. May I administer the 10,001st?" wrote one user on AgeofAutism.com. The outrage is triggered by Offit's approach, says Dan Olmsted, Age of Autism's editor: "He basically says the case is closed. He's very dismissive of anyone who disagrees." And critics charge that Offit, one of three patent holders of a vaccine against rotavirus – which causes severe diarrhea and kills half a million children a year worldwide – is dependent on drug companies and motivated by greed. They call him "Dr. Proffit."

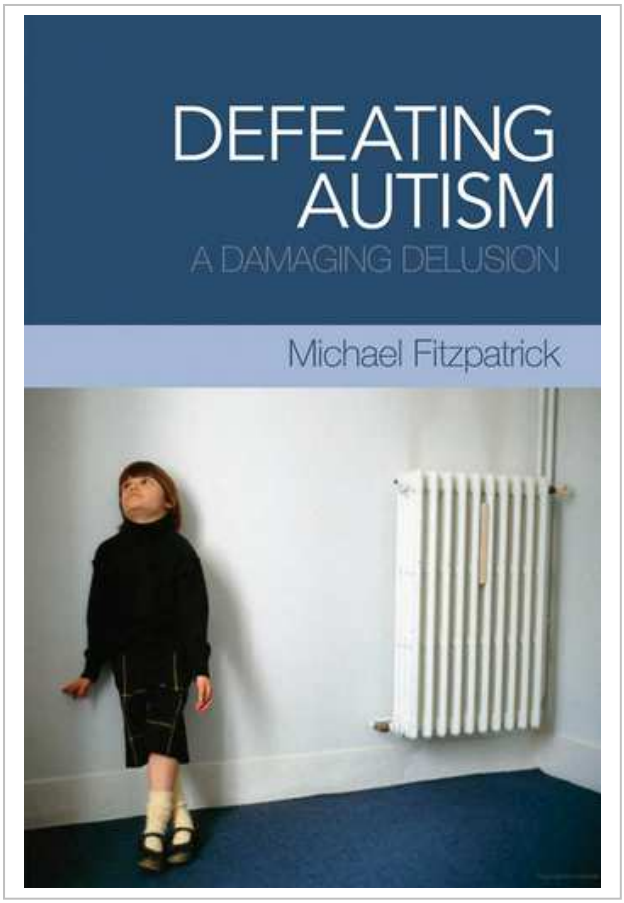
Offit isn't apologizing. He acknowledges that he got a "small percentage" of the $182 million Children's Hospital of Philadelphia received when it sold its interest in future royalties for the vaccine RotaTeq. (He won't give a precise amount, but says "it's like winning the lottery.") And he has served as both a paid and unpaid member of a scientific advisory board at Merck, which makes RotaTeq. Drug companies routinely hire experts as consultants, despite concerns by some that these relationships can undermine scientific credibility. But Offit says money has never been his motivator. At the age of 5, he spent three weeks in a polio ward, where he was housed to recover from clubfoot surgery. "It caused me to see children as very vulnerable and helpless and, I think, drove me through the 25 years of the development of the rotavirus vaccine," says Offit. Frankie Milley, who started a national organization called Meningitis Angels after losing her 18-year-old son, Ryan, to the disease, says Offit readily hands out his number to parents concerned about vaccine safety. "He truly hurts for children who are suffering or who have died," she says.

Scientific studies cannot prove a negative, so researchers must be cautious in the language they use to describe results. Because Offit refuses to garble the message, fellow scientists say, he is the perfect target. "He happens to be blessed with the gift of gab, and he's been willing to step up and be in the battle," says Dr. Edgar Marcuse, a pediatrician at Seattle Children's. "It requires a kind of offense and aggressiveness that's absolutely necessary to set the record straight." Dr. Peter Hotez, a professor and vaccine researcher at George Washington University, says government health officials should take a bolder stand in reassuring the public. Hotez feels as strongly as Offit does about the science (saying vaccines cause autism, he says, "is like saying the world is flat"), but, like other busy scientists, he's less willing to enter the fray. "Here's someone who has created an invention that saves hundreds of lives every day," says Hotez, whose daughter, 15, has autism, "and he's vilified as someone who hates children. It's just so unfair."

Michael Fitzpatrick

Defeating Autism: A Damaging Delusion

London & New York, Routledge, 27 October 2008
https://books.google.com.my/books?id=nQJ9AgAAQBAJ&source=gbs_navlinks_s



he concludes that 'we all have so much, when finally connected, that we can give'.

Jaquelyn McCandless

When her granddaughter was diagnosed with autism in 1996, Jaquelyn McCandless had been in private practice as a psychiatrist and sex therapist in California for 30 years and by her own admission 'knew almost nothing about autism' (McCandless 2005: 8). In recent years, according the biographical sketch in her 2005 book, *Children with Starving Brains*, 'her interest in women's issues and sexuality led to an alternative medical practice with a focus on anti-ageing, brain nutrition and natural hormone therapy' (McCandless 2005: xi). From here it was only a short step to providing biomedical and dietary treatments for autistic children whose 'brain cells' she believes 'are starving for nutrients'.

According to Jack Zimmerman, poet, mathematician, visionary educator and Jaquelyn's husband and co-author, she is 'an alchemist working on the edge of the mystery of healing' (McCandless 2005: 213). Jack believes that 'the children with starving brains are here to help us heal our starving hearts' (McCandless 2005: 194).

Jeffrey Bradstreet

When his son was diagnosed with autism in 1997, Jeff Bradstreet had abandoned his career as a family doctor to become a radio talk-show host. He subsequently took up the biomedical cause and founded the International Child Development Resource Center in Florida, where Andrew Wakefield was appointed director of research on his departure from the Royal Free Hospital in London in 2001. Dr Bradstreet also launched the Good News Doctor Foundation, whose logo featured a stethoscope and a bible, bringing together his 'vast research and clear grasp of scripture' and 'his professional medical expertise'. When Channel 4 flew Dr Bradstreet to London to provide back up for Dr Wakefield in the TV debate following the broadcast of *Hear the Silence*, he was variously presented as a paediatrician, a family practitioner and a professor of neuroscience.

Dr Bradstreet has collaborated on various projects of the vaccine–autism campaign as well as appearing as an expert witness in litigation claims. He has developed the 'Open Windows' autism biomedical training programme ('When God closes a door, somewhere He opens a window'). In his treatment centre, Dr Bradstreet offers the familiar biomedical treatment programme, in particular promoting his own range of vitamin and mineral supplements.

Smoke and Mirrors: Dr Richard Horton and the Wakefield Affair

Age of Autism, 22 December 2008
https://web.archive.org/web/20100414083541/http://www.ageofautism.com/2008/12/smoke-and-mirrors-dr-richard-horton-and-the-wakefield-affair.html

If we knew then what we know now we certainly would not have published the part of the paper which related to MMR, although I do believe there was and remains validity to the connection between bowel disease and autism.'

From the moment Richard Horton, editor of the Lancet, spoke these words on the BBC evening news of Friday 20 February 2004 Andrew Wakefield's career lay in tatters. For six years Horton and the Lancet had been under pressure over his decision to publish in February 1998 an 'early report' *Ileal-lymphoid-nodular-hyperplasia, non-specific colitis and autism in children* of which Wakefield - a senior researcher at the Royal Free Hospital in London - was lead author. At publication time Wakefield was already an author of more than a hundred peer review publications, but none before or since attracted the attention of this one. The paper, a series study of 12 consecutively referred cases, related to a sub-group children who had suffered adverse reactions to MMR vaccine, and hypothesised but did not confirm a connection between their symptoms and the vaccination.

Nevertheless, by implication the study struck at the heart of public health policy: the Royal Free Medical School called a press conference, and there was instant controversy. The British government and medical establishment never forgave Wakefield. They weren't that happy with Horton either, and he knew it.

Horton's decision to go to the BBC in February 2004 had been precipitated by an extraordinary meeting at the *Lancet* offices two days previously. Wakefield's 1998 paper had been investigated by a freelance journalist Brian Deer on behalf of the Sunday Times. According to Horton – giving evidence the UK General Medical Council in August 2007 – Deer had been dispatched with Liberal-Democrat member of parliament, Dr Evan Harris, in a last ditch attempt to rescue a failing story, held over from the previous week, and considered to weak to publish. Also present there with Wakefield, were Profs John Walker-Smith and Simon Murch, the two doctors presently on trial with him at the GMC, and another Royal Free doctor, the neurologist Peter Harvey.

Deer presented a raft of allegations about the conduct of the study, and unethical procedures conducted against the children in the study. These were rebutted by the doctors, and were neither upheld by the Royal Free or in turn the *Lancet*. The sticking point, however, came over the fact that Wakefield, alone of the Royal Free doctors, had been hired by the Legal Aid Board to investigate the possibility of class litigation against the MMR manufacturers. Confronted by Deer, Horton denied that he had known of this, and Deer at last had a story. Horton's decision to go public that Friday evening anticipated the publication of Deer's article in the *Sunday Times* (and comically led to him being sued by Deer in the small claims court). But Horton's declaration on its own ignited a media explosion and by the following morning he had also told the BBC that there was "a fatal conflict of interest" and the research was "fatally flawed". By Saturday, tea time, the Secretary of State for Health, John Reid, had requested that the General Medical Council investigate the case "as a matter of urgency". And all before Deer's story had gone to press for Sunday morning.

This episode smacks of gross media manipulation. Conflicts in medicine and science are commonplace – something that hitherto would not have raised an eye-brow was being foisted on the public at large as if it was grave misconduct – and that was even before considering the truth and validity of the allegation, which at the time would have been extremely hard to establish either way, and was certainly denied by Wakefield. Four years later when Wakefield finally produced powerful documentary evidence of his innocence at the General Medical Council no one in the media reported, although several journalists – including from the BBC and The Times - were present.

The outlandishness of what had happened was reflected in a remarkable passage the book which Horton was to publish within months of the episode, *MMR Science and Fiction: Exploring the Vaccine Crisis*, in which he recalled his dinner engagement on the Monday following these events, and result of the Health Secretary's immediate request that the GMC investigate:

In truth, they (the GMC) *had not a clue where to begin. At a dinner I attended on 23 February (2004), one medical regulator and I discussed the Wakefield case. He seemed unsure of how the Council could play a useful part in resolving the confusion. As we talked over coffee while the other dinner guests were departing, he scribbled down some possible lines of investigation, and passed me his card, suggesting that I contact him directly if anything sprang to mind. He seemed keen to pursue Wakefield, especially given ministerial interest. Here was professionally led regulation of doctors in action - notes exchanged over liqueurs in a beautifully panelled room of one of medicine's most venerable institutions* (p7-8)

This could almost be a comic parody of the British establishment at work if it was not for real. But Horton's decision to turn on Andrew Wakefield has been one of the long neglected (and tragic) turning points in the Wakefield affair.

I have long been curious about Horton's role in this saga. When I wrote recently to the president of the GMC, Sir Graeme Catto, to ask him to explain Horton's involvement (and potential misconduct), he declined to respond, but passed my open letter to their investigatory branch. I received this reply:

In short, I can assure you that the instigation of our investigations has absolutely nothing to do with any conversations which 'medical regulators' may have had with Dr Horton at the dinner described in his book. If such conversations took place, they were not reported back in to our investigations team who were looking at the case at the time. This being the case, the content of any such discussions had absolutely no impact at all on any of the decisions made about whether to proceed to investigate the case or, indeed, how such investigations should be carried forward.

How could they possibly know whether their investigations have been influenced by the conversations if they have not even asked about it, and are totally incurious even now that it has been pointed out? It does not matter by now what departures we have from ordinary process, or whether there is even *prima facie* evidence of misconduct. The trial must go on.

Although the "medical regulator" Horton met that Monday evening in February 2004 did not seem concerned about the ethics of exploring ways in which Andrew Wakefield might be prosecuted (and with the star witness!), he certainly did not seem convinced that Wakefield had done anything wrong. This may have been because undisclosed conflicts of interest are so common that you could not practicably start prosecuting them (where would it end?) but also (as he may already have considered) that acting as an expert witness for the courts did not by convention constitute a conflict at all. In fact, this argument was helpfully put by a legal counsel (in the British system 'a barrister') Robert Hantusch in a letter to *The Times* the following day (24 February 2004):

... the courts do not consider that the engagement of someone to act as an expert witness in litigation has the effect that that person is then biased. Indeed, if this were the legal position, no paid professional could ever at any time give evidence to a court.

And this defence was also taken up by a witness on the other side of the case, Elizabeth Miller, when it was pointed out in the satirical journal Private Eye that she had a like conflict (if it was such):

...there can be no conflict of interest when acting as an expert for the courts, because the duty to the courts overrides any other obligation, including to the person from whom the expert receives the instruction or by whom they are paid. (19 March 2004)

As of the present, of course, Miller has yet to be summoned before the GMC.

But was Horton's allegation that Wakefield had withheld information about his work with the Legal Aid Board really true? At the end of the week (27 February 2004) the Independent newspaper finally located striking evidence in Wakefield's defence: a letter published on 2 May 1998 in the Lancet, nine weeks after the controversial study, in which Wakefield replied to a correspondent, Andrew Rouse, who raised the possibility of "litigation bias":

A Rouse suggests that litigation bias might exist by virtue of information he has downloaded from the internet: from the Society for the Autistically Handicapped. Only one author (AJW) has agreed to help evaluate a small number of these children on behalf of the Legal Aid Board [emphasis added]. *These children have all been seen expressly on the basis that they were referred through normal channels (eg, from general practitioner, child psychiatrist, or community paediatrician) on the merits of their symptoms. AJW has never heard of the Society for the Autistically Handicapped and no fact sheet has been provided by them to distribute to interested parties. The only fact sheet we have produced is for general practitioners, which describes the background and protocol for the investigation of children with autism and gastrointestinal symptoms. Finally, all those children referred to us (including the 53 who have been investigated already and those on the waiting list that extends into 1999) have come through the formal channels described above. No conflict of interest exists.*

The information that Wakefield (and Rouse) were referring to was a fact sheet compiled by the legal firm Dawbarns who were pursuing a class action against the MMR manufacturers at the time, downloaded from an independent website. So, while Wakefield denied that the matter constituted a conflict he had clearly stated his involvement in the litigation at that early stage. Unfortunately, the *Independent* story made little difference. The BBC, with its commitment to balance and impartiality long forgotten, refused to report this (though I for one personally bombarded the head of news Richard Sambrook with emails), and only the *Telegraph* doctor James Le Fanu took up the issue (2 March 2004). It is worth quoting the entire passage from his column, headed 'The truth about MMR must be revealed':

The Government finds itself in an invidious situation over the MMR/autism controversy, having painted itself into a corner by denying parents the option of the single measles vaccine. They, thus, have no alternative other than to insist the MMR is totally safe - irrespective of evidence that might emerge to suggest the contrary.

Their difficulty is that this position is now looking a lot shakier than it did even a year ago. Several further independent studies have confirmed the association of the syndrome of regressive autism with chronic bowel disorder that was originally described by Andrew Wakefield. More recently, research has confirmed the presence of the measles virus in the gut and spinal fluid of affected children.

This may not constitute "proof" and, indeed, a former colleague of Dr Wakefield challenged the significance of these findings in the Lancet a fortnight ago - and he may be right to do so. None the less, it is beginning to look as if, as neurologist Peter Harvey points out in the same issue, there is now "a step-by-step cascade of evidence" linking the MMR vaccine to some cases of autism.

This could explain the assault on Dr Wakefield's integrity. The validity of his original findings, it is claimed, may have been compromised by a conflict of interest involving research funds that he failed to disclose. This might be relevant if it were true, but it is not, as anyone can check for themselves: Dr Wakefield acknowledged the source of his funding in the Lancet in 1998. It would seem to be that neither the Government nor the medical establishment can afford for Dr Wakefield to be vindicated - and they are getting pretty desperate.

But, remarkably, the role of the man at the centre of the non-disclosure allegation has largely escaped public scrutiny. In *MMR Science and Fiction*, Horton, while elaborating on the circumstances which led him to throw Wakefield to the wolves skirted delicately around the evidence that Wakefield did indeed disclose his work with the Legal Aid Board.

Critically Horton reproduces an apparently heated exchange from a parliamentary committee meeting of 1 March 2004 between Evan Harris, and the *Lancet's* boss, Crispin Davis, Chief Executive of Reed Elsevier (p.50-1). Both men wave the letter of 2 May 1998 around, Davis citing the statement that there was no conflict of interest, but neither places on the parliamentary record that Wakefield had stated in that very letter that he was engaged in the litigation, and whether it was a conflict or not, it had certainly been in the public domain from that time. (But while we are on the subject of conflicts of interest, perhaps Davis needed to point out -and Horton certainly failed to do so – before becoming sanctimonious about Wakefield that he was appointed a non-executive director of MMR defendants GlaxoSmithKline in July 2003.)

When he gave evidence to the GMC in August 2007 Horton stated that he had not understood from the declaration that Wakefield's involvement pre-dated the publication of the study two months earlier. The only trouble with this was that Rouse's letter, forwarded by the *Lancet* to Wakefield on 2 April 1998, was according to Wakefield's testimony actually dated 4 March, four days after the publication of the study – which would suggest that any such misunderstanding on Horton's part was either disingenuous in the extreme, or simply incompetence.

The problem with Horton's evasions was compounded by his transparently flawed account in his book of the session in the *Lancet* offices with Brian Deer on 18 February 2004:

There the consensus ended. Wakefield admitted that he had been commissioned by the Legal Aid Board to conduct a pilot study on behalf of parents of allegedly MMR-vaccine-damaged children. Some of his colleagues claimed that he had not disclosed this fact to them. Simon Murch and John Walker-Smith were visibly shocked by this revelation.

How anybody could have been shocked about a matter which had been in the public domain for six years is a mystery: in fact when presenting his evidence to the GMC in March 2008 Wakefield read a letter he had written in early 1997 to Walker-Smith and Murch explaining his decision to act as an expert in the MMR litigation – a line from it was subsequently quoted in a BMJ report (5 April):

If these diseases are found to be linked to the MMR vaccine, these children are the few unfortunate who have been sacrificed to protect the majority.

Thus, while there may not have been agreement between them on this, the claim that the matter was hidden from close colleagues would appear to be fanciful.

So what really happened at that meeting between the three doctors and Horton? At the GMC in August 2007 Horton described the pivotal moment of revelation as relating to the Dawbarns fact sheet which Deer had produced, which promoted the case against the MMR manufacturers and alluded to Wakefield's involvement. It was Deer's production of the fact sheet which purportedly caused discomfort to Walker-Smith and Murch, and left Horton denying to Deer and Harris that he had known of Wakefield's enrolment by the Legal Aid Board.

Beyond the Wakefield-Rouse correspondence in May 1998, did Horton have any other occasion to learn of Wakefield's Legal Aid work? Indeed, unlike Wakefield, Horton's office itself was involved in a lengthy correspondence with Dawbarns, long before the publication of the Wakefield's study in February 1998. In his testimony to the GMC in April 2008 rebutting Horton's claim, Wakefield revealed stunning new information from a previously undisclosed 1997 correspondence between the Lancet and Dawbarns about the Dawbarns fact sheet to which Horton had been party. According to this exchange, at some point in March 1997, or just before, an employee of the UK Medicines Control Agency (later MHRA), Dr B D Edwards, writing in his private capacity, alerted Horton to the use of Lancet material (not the unpublished autism study) in the Dawbarns fact sheet – this included extracts

from other articles by Wakefield and some tables. The *Lancet* then wrote to Dawbarns warning them they should apply to the journal if they wanted to continue to reproduce it. There then followed an extended letter from the lead lawyer for the case, Richard Barr, to Horton dated April 3, 1997, mentioning that Wakefield had given permission to refer to an article and citing a statement on the fact sheet:

There is convincing evidence of a link between vaccination and inflammatory bowel disease (including Crohn's disease). It is a serious lifelong illness that has affected a large number of the children we are helping. We are working with Dr Andrew Wakefield of the Royal Free Hospital London. He is investigating this condition [emphasis added].

It was important for Barr to draw attention to Wakefield's involvement, because it added moral weight to his case that the *Lancet* should allow publication. Horton wrote back denying permission and a lengthy correspondence ensued involving the *Lancet* ombudsman Prof Thomas Sherwood, in which a compromise was reached – this was concluded in the month of July 1997 just as the controversial study was being passed for publication, and presumably there would have been communications within the *Lancet* between Sherwood and Horton on the matter.

While it may have been a shock for John Walker-Smith and Simon Murch when Brian Deer produced the fact sheet in the *Lancet* offices because they had never seen it before, Horton claims that, in his role as guarantor of the ethics and reputation of The *Lancet*, it came as an even bigger shock to him because Wakefield had violated ethical guidelines by withholding disclosure of the Legal Aid connection. But when Wakefield finally produced this evidence to the GMC in April 2008 that Horton and The *Lancet's* ombudsman had been engaged in extended discussions with the Legal Aid attorneys over their desire to cite work from their expert witness Wakefield in a fact sheet, it was barely reported: not, for instance, by the BBC or by *The Times* (although they had their journalists present), nor even by Brian Deer. Only in *British Medical Journal* was there a half-buried account by Owen Dyer (April 19):

Dr Wakefield's defence challenged testimony given earlier by Richard Horton, editor of the Lancet, who said that he had not known before the article's publication of Dr Wakefield's work on behalf of MMR litigants.

Dr Wakefield alleged that newly uncovered documents reveal an extensive correspondence between the Lancet and Dawbarns, the firm of solicitors representing MMR claimants. These letters, several months before publication of the 1998 article, described Dr Wakefield's work on behalf of the MMR litigants, he said. While he was "not impugning Dr Horton's honesty," said Dr Wakefield, the documents proved "in my opinion beyond a shadow of a doubt that he was aware of all these factors."

Dr Horton, reached by email while travelling abroad, denied any foreknowledge of the conflict of interest, saying that the correspondence did not make clear Dr Wakefield's role in litigation.

In most accounts of Wakefield's Legal Aid connection, the media have generally accepted Horton's description of his editorial judgement: if he had known of the connection before publication of the 1998 study he would not have approved it. But there is another possibility: that Horton only decided it was a significant matter long after the event. Indeed, two letters written by Wakefield to the *Lancet* on the MMR issue in (September 11, 1999 and August 26, 2000) after the disclosure of May 1998 that he was working for the Legal Aid Board were passed for publication without any such declaration.

Horton's inconsistency was further exposed when in 2004 – after the Wakefield affair blew up - the *Lancet* held out for 5 months over publishing a letter from Mark Geier regarding Michael Pichichero's non-disclosure of pharmaceutical company funding in another vaccine autism study 'Mercury concentrations and metabolism in infants receiving thiomersal: a descriptive study' (2002). Pichichero's silence over his competing interests in this paper stood in contrast to information revealed in an earlier study, which had the following declaration:

The author has received research grants and/or honoraria from the following pharmaceutical companies: Abbott Laboratories, Inc.; Bristol Myers Squibb Company; Eli Lilly and Company; Merck&Co.; Pasteur Merieux Connaught; Pfizer Labs; Roche Laboratories; Roussel-Uclaf; Schering Corporation; Smith Kline Beecham Pharmaceuticals; Upjohn Company; Wyeth-Lederle.

This lapse was only resolved after I had posted on it twice in British Medical Journal Rapid Responses. To all appearances this non-disclosure – which hid extensive commercial interests - was far more compromising: but to the *Lancet* it was barely worth mentioning, and not to be compared to the perfidy of Wakefield – indeed, they only agreed to publish a version of the Geier letter if Wakefield was not mentioned in it. Some conflicts in Horton's world are evidently more fatal than others.

Many months after Wakefield's evidence a new statement was finally obtained by the prosecution at GMC from Horton, presumably explaining as best he can the apparent discrepancies in his earlier evidence, but the hearing was having trouble pinning down a time for him to be questioned about it. Though Horton's office is less than a mile up the road from the GMC hearing, he will apparently be engaged in an important peace mission to the Middle East when it next sits in January.

It was always the strategy of the British scientific establishment and government to isolate and destroy Andrew Wakefield – to make him look as if he was standing scientifically and intellectually on his own, and to make sure when they crushed him they discredited all further opposition or dissent on the vaccination issue. In the US context Horton's book *MMR Science and Fiction* would be an almost incomprehensible oddity. There is, for instance, only a single mention of thimerosal, which apparently is just another eccentric concern of Wakefield's. In essence the alleged "vaccine crisis" of the title is entirely about Wakefield and the supposed gullibility of people who doubt official science. Horton's book is not ultimately about scientific truth, it is about who is credible – we are being told not only is Wakefield not credible, most importantly the parents of vaccine damaged children are not credible either. And cleverly nuanced as Horton's argument is for a liberal readership, his decision to turn on Wakefield has behind it a highly illiberal and authoritarian basis, in which the interests and voices of the patients and their families are to be finally stamped out. It is ultimately just stage management, and a stab in the back for open debate.

John Stone has an autistic son, and lives in London.

Insurance companies question autism clinic's charges Owner of clinic, which uses controversial therapies, says she's had to lay off staff, cut hours

Statesman, 3 May 2009.
https://web.archive.org/web/20090506050153/http://www.statesman.com/news/content/news/stories/local/05/03/0503autismclinic.html

The owner of an Austin-area clinic that treats children with autism – using techniques that are controversial in mainstream medicine – says investigations by three major insurers have left it with a pile of unpaid claims and a crisis: She's had to lay off most of her staff and drastically reduce the clinic's hours.

In addition, Kazuko Grace Curtin said the Texas Medical Board is investigating her medical director. She and the doctor – Jesus Caquias – say *the investigation is a way of harassing them because they offer nontraditional care for autism patients*.

Curtin, who has no formal medical training, said she founded the clinics because her son, now 14, has autism and she was frustrated by doctors who said he could not be helped. So, in 2003 she opened CARE Clinics, a 9,000-square-foot facility at 4201 Bee Cave Road.

She said that she and her husband, Jim Curtin, "made over $100 million" when the software company he headed, Dascom Inc., was sold to IBM but that she started the clinic with $17,000 in her own bank account. In June, she opened a second clinic in Tampa, Fla. The clinics mainly provide medical treatments to children with autism.

Curtin says they've treated more than 5,000 patients from around the world, performing more than 20,000 intravenous therapies, including chelation therapy. Chelation, which introduces a chemical solution into the body to bind with a metal or other substance to be removed, is controversial.

It's approved by the Food and Drug Administration only for removing lead from the blood, and though doctors use it for other purposes, such as treating heart disease and cancer, some practitioners say it can be dangerous, especially when used for treatments other than lead removal.

The National Institute of Mental Health *canceled a study on chelation in autistic children last fall*, saying the money would be better spent on other therapies. Agency officials were quoted at the time also citing safety concerns.

Autism is a complex neurodevelopmental disorder marked by speech difficulties and odd behaviors. Behavioral therapy is widely accepted treatment for autism, but even insurance coverage for that scientifically proven therapy can be spotty. Insurance companies often do not pay for medical treatments for autism.

Though some parents who have brought their children to CARE Clinics say they've seen improvements, critics say it uses therapies that lack strong scientific proof they work.

Dr. Alan Woolf, director of the pediatric environmental health center at Children's Hospital in Boston, said he was not personally familiar with CARE Clinics but was aware of doctors and clinics that offer to treat autism with similar therapies.

"We ask parents to be cautious because (autism) is a condition without a known etiology (cause) in most cases," Woolf said. "In that environment, parents are easily misled or will grasp onto a theory or a belief because they're desperate and looking for answers."

CARE Clinics is struggling now because Aetna stopped paying claims in August and is questioning "about $1 million" in claims, Curtin said. Cigna and United Healthcare stopped payments in October and are disputing smaller amounts that Curtin declined to reveal. United is paying again but at a lower rate, she said.

"What they were saying is, autism treatment is not established, it's experimental," Curtin said.

Spokeswomen for Cigna and United said the reviews were routine to ensure proper payments. Aetna declined to comment.

Curtin said she closed the two clinics in January to cope with the amount of paperwork she had to produce when the three insurance companies challenged charges for all patients treated in October, November and December. She reopened the Austin clinic March 6, but now it's open 10 days a month instead of 20 and has 10 employees instead of 40, she said. The Tampa clinic won't reopen until May, she said.

She also is delaying indefinitely a 30,000-square-foot medical building, school, corporate offices, sports facility, lodge and conference center in Dripping Springs.

"I need some funds," Curtin said, declining to release specific financial details about her business. "I don't know how long we can survive."

The clinic performs more than 20 tests on each child that cost "several hundred dollars" each, said Caquias, who practices general medicine,.

The tests help them identify ailments that Curtin says are common in autistic children: amino acid deficiencies, immune system dysfunction, gastrointestinal problems, multiple infections, food allergies, neurotoxicity and other impairments.

"Since this is a long-term solution that may need to be repeated over several months to several years, it can be quite costly in the tens of thousands of dollars," Caquias wrote in an e-mail. "Some children respond very well after just a few interventions, while others require many more interventions to achieve the same response."

"*We have cured many kids*," Curtin said.

Conventional doctors who work with autistic children say there's no cure.

CARE Clinics bill insurance companies for a variety of treatments for ailments such as metabolic syndrome, mitochondrial dysfunction, gastrointestinal problems and other disorders based on the child's test results, Caquias said. The autism is related to those underlying disorders, and when corrected, the autism improves, he said.

"*We really don't treat the autism per se. We treat all of the issues the patient has*," Caquias said.

Mainstream doctors say while some patients seem to have higher-than-normal gastrointestinal problems, doctors do not routinely see the medical problems the CARE Clinics treats in autistic children.

"There is a lack of support for those claims," said Dr. Dilip Karnik, a child neurologist and medical director of the autism program at Dell Children's Medical Center in Austin.

If there were evidence that the CARE Clinics' approach worked, "we would be doing it," he said. He said some children with autism do get better, some with conventional treatment, some on their own.

The Thoughtful House Center for Children, which also is on Bee Cave Road and treats children from around the world with autism, focuses on GI problems based on a theory by Executive Director Andrew Wakefield that conventional doctors and researchers also dispute. Unlike the CARE Clinics, Thoughtful House does not bill insurance companies but leaves it to parents to seek reimbursement.

In Texas, no regulatory agency oversees such clinics. Complaints go to boards that police doctors or nurses working in them. Caquias, who also practices in Brownsville, has a medical board complaint pending against him. The complaint, provided by Curtin, alleges without details "practice inconsistent with public health and welfare – quality of care" and "non-therapeutic prescribing or treatment."

The medical board disciplined him in 2006 and 2007 for minor infractions involving recordkeeping and promoting his affiliations with alternative medical boards not recognized by the American Board of Medical Specialties.

The latest complaint "*is false and malicious, filed by some unknown entity intent on destroying CARE Clinics' alternative medical treatments of Autistic children*," Caquias wrote to the board.

Caquias was among those who testified this month when the House Public Health Committee aired House Bill 3816, which would curtail the powers of the Texas Medical Board, the state agency that regulates doctors. Caquias, parents of autistic children and others alleged that those who treat autism face discrimination by the board and by insurance companies that don't want to pay for the care.

They also accused insurers of filing anonymous complaints with the board to trigger investigations of alternative medicine doctors – a charge the insurance industry and medical board denied.

The medical board is driven by complaints and "does not target any particular area of medicine," said Mari Robinson, the board's executive director. Nor does the board work with insurance companies to go after doctors, she said.

Jennifer Ahrens, executive director of the Texas Association of Life and Health Insurers, said the industry is not targeting alternative medicine doctors or trying to get out of contracts to pay claims. "To say that insurance companies are trying to get at doctors by making anonymous complaints is unfounded," she said.

Curtin blames a retired North Carolina psychiatrist, Dr. Stephen Barrett, for instigating the medical board reviews through his Web site, Quackwatch. Last year, Barrett posted an article on his site cautioning people to "Be Wary of CARE Clinics" as well as a charity that Curtin also heads. He wrote that most of the tests CARE Clinics conduct "have no proven relevance to autistic spectrum disorders."

Curtin said Barrett works for insurance companies and has been a witness in court cases for them. She also accused him of filing the latest complaint against Caquias.

Barrett wouldn't discuss the medical board complaint. He said he works independently and is not paid by any insurance companies. He said he has provided expert witness testimony a time or two, but "I have no financial relationship with anyone who's after CARE Clinics. ... There's no conspiracy, and I'm not a part of it."

The Quackwatch article "is intended to make people think very seriously about whether they should trust" the clinic, he said. "I've looked at what she's billing insurance companies for, and no insurance company, in my opinion, would knowingly pay for that stuff."

Curtin provided copies of affidavits she said she's received from three of the four patients (or their parents) named in the complaint against Caquias. She also provided the names of other parents, who in interviews spoke highly of the care their children received at CARE Clinics.

Elizabeth Dupont, 36, of El Paso said she starting taking her 6-year-old daughter, Mia, to CARE Clinics a year ago and saw her personality start to emerge by the second visit after her intestinal problems and other ailments were treated. "*She, for the first time, started looking at me*," Dupont said. "*She looked present*." She still has autism, "*but people would not know she is autistic unless I tell them*."

Marie Groover, 50, of Ashland, Ore., had a chance to take her 16-year-old son to the clinic once last year and spent $3,000 to $5,000 on testing, she said. He spoke his first words in a long time, she said. "For the (American Medical Association) to insinuate that we're being taken advantage of is so wrong," she said.

Karnik urged parents to be cautious. Blood and urine tests don't tell what is happening in the brain, he said.

Autism "must be managed by a brain scientist," he said. "You've got to know the brain, in and out."

Mitochondrial dysfunction, impaired oxidative-reduction activity, degeneration, and death in human neuronal and fetal cells induced by low-level exposure to thimerosal and other metal compounds

Toxicol Environ Chem. 11 June 2009, 91(3-4):735-749.
doi: 10.1080/02772240802246458. Epub 2009 Jun 11..

Abstract

Thimerosal (ethylmercurithiosalicylic acid), an ethylmercury (EtHg)-releasing compound (49.55% mercury (Hg)), was used in a range of medical products for more than 70 years.

Of particular recent concern, routine administering of Thimerosal-containing biologics/childhood vaccines have become *significant sources of Hg* exposure for some fetuses/infants.

This study was undertaken to investigate cellular damage among *in vitro* human neuronal (SH-SY-5Y neuroblastoma and 1321N1 astrocytoma) and fetal (nontransformed) model systems using cell vitality assays and microscope-based digital image capture techniques to assess potential damage induced by Thimerosal and other metal compounds (aluminum (Al) sulfate, lead (Pb)(II) acetate, methylmercury (MeHg) hydroxide, and mercury (Hg)(II) chloride) where the cation was reported to exert adverse effects on developing cells.

Thimerosal-associated *cellular damage* was also evaluated for similarity to pathophysiological findings observed in patients diagnosed with autistic disorders (ADs).

Thimerosal-induced cellular damage as evidenced by concentration- and time-dependent mitochondrial damage, reduced oxidative–reduction activity, cellular degeneration, and cell death in the *in vitro* human neuronal and fetal model systems studied.

Thimerosal at low nanomolar (nM) concentrations *induced significant cellular toxicity in human neuronal and fetal cells*.

Thimerosal-induced cytoxicity is similar to that observed in AD pathophysiologic studies.

Thimerosal was found to be significantly *more toxic than the other metal compounds examined*.

Future studies need to be conducted to evaluate additional mechanisms underlying Thimerosal-induced cellular damage and assess potential co-exposures to other compounds that may increase or decrease Thimerosal-mediated toxicity.

Autism clinic raided by federal authorities

Statesman, 15 July 2009.
https://web.archive.org/web/20090718061558/http://www.statesman.com/blogs/content/shared-gen/blogs/austin/health/entries/2009/07/15/autism_clinic_raided_by_federa.html

CARE Clinics, an autism clinic on Bee Cave Road that was being investigated by insurance companies over insurance claims, was raided by the FBI and IRS agents today.

The clinic has been closed, perhaps permanently.

Agents are removing dozens of boxes of documents, but they declined to say what they are looking for. They directed inquiries to Special IRS Agent Mike Lemoine, who did not immediately return a call.

Kazuko Grace Curtin, owner of the CARE Clinics, said in a brief phone call that the clinic at 4201 Bee Cave Road has "finally closed." She said she was on the property talking to "a man and a woman" but didn't know what was going on. She declined to comment for this article.

Kurt Simons Co., property manager of The Schoolyard, where CARE Clinics once had a 9,000-square-foot space, locked out clinic employees this morning because of "outstanding matters," said Karen Wendler, the company's vice president. The clinic had recently reduced its space to 2,700 square feet.

Soon after the company locked out Curtin and her staff today, the federal agents showed up. The lockout was not related to the raid, Wendler said.

Wendler declined to say what problems led to the lockout.
"We helped her get started and we did not have a history of any problems," Wendler said.

Traffic at the clinic had slowed, she said.

In a previous Statesman article, Curtin said three major insurance companies were investigating billings by CARE Clinics, causing her financial problems. She had cut staff and clinic hours and had unpaid bills, she said. =>
https://web.archive.org/web/20090506050153/http://www.statesman.com/news/content/news/stories/local/05/03/0503autismclinic.html

CARE *clinics mainly treated children with autism using alternative therapies typically frowned on by mainstream doctors*. Though some parents who brought their children to CARE Clinics say they've seen improvements in their child's autistic behaviors, critics say the clinic uses therapies that lack strong scientific evidence. The clinic commonly uses intravenous chelation on patients, a controversial treatment that introduces a chemical solution into the body to bind with a metal or other substance to be removed.

Squalene: The Swine Flu Vaccine's Dirty Little Secret Exposed

Educate Yourself, 17 July 2009
http://educate-yourself.org/vcd/mercolasqualenedangers17jul09.shtml

According to Kathleen Sebelius, Secretary of the U.S. Department of Health and Human Services, your children should be the first target for mass swine flu vaccinations when school starts this fall.[i]

This is a ridiculous assumption for many reasons, not to mention extremely high risk.

In Australia, where the winter season has begun, Federal Health Minister Nicola Roxon is reassuring parents the swine flu is no more dangerous than regular seasonal flu. "Most people, including children, will experience very mild symptoms and recover without any medical intervention," she said.[ii]Sydney-based immunization specialist Robert Booy predicts swine flu might be fatal to about twice as many children in the coming year as regular influenza. Booy estimates 10-12 children could die from the H1N1 virus, compared with the five or six regular flu deaths seen among children in an average year in Australia.[iii]

"Cure the Disease, Kill the Patient"

Less than 100 children in the U.S. die each year from seasonal flu viruses.[iv] If we use Australia's math, a very rough estimate would be another 100 children could potentially die of swine flu in the United States in the coming year. If children are the first target group in the U.S. per Sebelius, that means we're about to inject around 75 million children with a fast tracked vaccine containing novel adjuvants, including dangerous squalene, to prevent perhaps 100 deaths. I'm not overlooking the tragedy of the loss of even one child to an illness like the H1N1 flu virus. But there can be no argument that unnecessary mass injection of millions of children with a vaccine containing an adjuvant known to cause a host of debilitating autoimmune diseases is a reckless, dangerous plan.

Why are Vaccinations Dangerous?

The presumed intent of a vaccination is to help you build immunity to potentially harmful organisms that cause illness and disease. However, your body's immune system is already designed to do this in response to organisms which invade your body naturally. Most disease-causing organisms enter your body through the mucous membranes of your nose, mouth, pulmonary system or your digestive tract – not through an injection. These mucous membranes have their own immune system, called the IgA immune system. It is a different system from the one activated when a vaccine is injected into your body. Your IgA immune system is your body's first line of defense. Its job is to fight off invading organisms at their entry points, reducing or even eliminating the need for activation of your body's immune system. When a virus is injected into your body in a vaccine, and especially when combined with an immune adjuvant like squalene, your IgA immune system is bypassed and your body's immune system kicks into high gear in response to the vaccination. Injecting organisms into your body to provoke immunity is contrary to nature, and vaccination carries enormous potential to do serious damage to your health.

And as if Vaccines weren't dangerous enough on their own … imagine them turbocharged.

The main ingredient in a vaccine is either killed viruses or live ones that have been attenuated (weakened and made less harmful).Flu vaccines can also contain a number of chemical toxins, including ethylene glycol (antifreeze), formaldehyde, phenol (carbolic acid) and even antibiotics like Neomycin and streptomycin. In addition to the viruses and other additives, many vaccines also contain immune adjuvants like aluminum and squalene. The purpose of an immune adjuvant added to a vaccine is to enhance (turbo charge) your immune response to the vaccination. Adjuvants cause your immune system to overreact to the introduction of the organism you're being vaccinated against. Adjuvants are supposed to get the job done faster (but certainly not more safely), which reduces the amount of vaccine required per dose, and the number of doses given per individual. Less vaccine required per person means more individual doses available for mass vaccination campaigns. Coincidentally, this is exactly the goal of government and the pharmaceutical companies who stand to make millions from their vaccines.

Will There be Immune Adjuvants in Swine Flu Vaccines?

The U.S. government has contracts with several drug companies to develop and produce swine flu vaccines. At least two of those companies, Novartis and GlaxoSmithKline, are using an adjuvant in their H1N1 vaccines. The adjuvant?

Squalene.

According to Meryl Nass, M.D., an authority on the anthrax vaccine, "A novel feature of the two H1N1 vaccines being developed by companies Novartis and GlaxoSmithKline is the addition of squalene-containing adjuvants to boost immunogenicity and dramatically reduce the amount of viral antigen needed. This translates to much faster production of desired vaccine quantities."[v]

Novartis's proprietary squalene adjuvant for their H1N1 vaccine is MF59. Glaxo's is ASO3. MF59 has yet to be approved by the FDA for use in any U.S. vaccine, despite its history of use in other countries. Per Dr. Nass, there are only three vaccines in existence using an approved squalene adjuvant. None of the three are approved for use in the U.S.

What Squalene Does to Rats

Oil-based vaccination adjuvants like squalene have been proved to generate concentrated, unremitting immune responses over long periods of time.[vi] 2000 study published in the American Journal of Pathology demonstrated a single injection of the adjuvant squalene into rats triggered "chronic, immune-mediated joint-specific inflammation," also known as rheumatoid arthritis.[vii] The researchers concluded the study raised questions about the role of adjuvants in chronic inflammatory diseases.

What Squalene Does to Humans

Your immune system recognizes squalene as an oil molecule native to your body. It is found throughout your nervous system and brain. In fact, you can consume squalene in olive oil and not only will your immune system recognize it, you will also reap the benefits of its antioxidant properties. The difference between "good" and "bad" squalene is the route by which it enters your body. Injection is an abnormal route of entry wh ch incites your immune system to attack all the squalene in your body, not just the vaccine adjuvant. Your immune system will attempt to destroy the molecule wherever it finds it, including in places where it occurs naturally, and where it is vital to the health of your nervous system.[viii]

Gulf War veterans with Gulf War Syndrome (GWS) received anthrax vaccines which contained squalene.[ix] MF59 (the Novartis squalene adjuvant) was an unapproved ingredient in experimental anthrax vaccines and has since been linked to the devastating autoimmune diseases suffered by countless Gulf War vets.[x]

The Department of Defense made every attempt to deny that squalene was indeed an added contaminant in the anthrax vaccine administered to Persian Gulf war military personnel – deployed and non-deployed – as well as participants in the more recent Anthrax Vaccine Immunization Program (AVIP). However, the FDA discovered the presence of squalene in certain lots of AVIP product. A test was developed to detect anti-squalene antibodies in GWS patients, and a clear link was established between the contaminated product and all the GWS sufferers who had been injected with the vaccine containing squalene. A study conducted at Tulane Medical School and published in the February 2000 issue of Experimental Molecular Pathology included these stunning statistics:

" … the substantial majority (95%) of overtly ill deployed GWS patients had antibodies to squalene. All (100%) GWS patients immunized for service in Desert Shield/Desert Storm who did not deploy, but had the same signs and symptoms as those who did deploy, had antibodies to squalene.

In contrast, none (0%) of the deployed Persian Gulf veterans not showing signs and symptoms of GWS have antibodies to squalene. Neither patients with idiopathic autoimmune disease nor healthy controls had detectable serum antibodies to squalene. The majority of symptomatic GWS patients had serum antibodies to squalene."[xi]

=> Asa P. et al. Antibodies to squalene in Gulf War syndrome. Exp Mol Pathol. 2000 Feb; 68 (1):55-64.

According to Dr. Viera Scheibner, Ph.D., a former principle research scientist for the government of Australia: "… this adjuvant [squalene] contributed to the cascade of reactions called "Gulf War Syndrome," documented in the soldiers involved in the Gulf War.

The symptoms they developed included arthritis, fibromyalgia, lymphadenopathy, rashes, photosensitive rashes, malar rashes, chronic fatigue, chronic headaches, abnormal body hair loss, non-healing skin lesions, aphthous ulcers, dizziness, weakness, memory loss, seizures, mood changes, neuropsychiatric problems, anti-thyroid effects, anaemia, elevated ESR (erythrocyte sedimentation rate), systemic lupus erythematosus, multiple sclerosis, ALS (amyotrophic lateral sclerosis), Raynaud's phenomenon, Sjorgren's syndrome, chronic diarrhoea, night sweats and low-grade fevers."[xii]

Post Vaccination Follow-Up Might as Well Be Non-Existent

There is virtually no science to support the safety of vaccine injections on your long-term health or the health of your children. Follow-up studies last on average about two weeks, and look only for glaring injuries and illnesses.Autoimmune disorders like those seen in Gulf War Syndrome frequently take years to diagnose due to the vagueness of early symptoms. Complaints like headaches, fatigue and chronic aches and pains are symptoms of many different illnesses and diseases.Don't hold your breath waiting for vaccine purveyors and proponents to look seriously at the long-term health consequences of their vaccination campaigns.

What You Can Do to Protect Yourself and Your Family

Visit the *National Vaccination Information Center* (NVIC) site and join in the fight against mandatory swine flu vaccinations. Educate yourself about influenza strains, vaccination risks, and the public health laws in your state that may require you or your children to undergo either mandatory vaccination or quarantine. Take care of your health to reduce or eliminate your risk of contracting the flu. The key is to keep your immune system strong by following these guidelines:

https://web.archive.org/web/20090626043642/http://www.nvic.org/NVIC-Vaccine-News/June-2009/Swine-Flu-Vaccine--Will-We-Have-A-Choice--by-Barba.aspx

- Eliminate sugar and processed foods from your diet. Sugar consumption has an immediate, debilitating effect on your immune system.
- Take a high quality source of animal-based omega 3 fats like Krill Oil.
- Exercise. Your immune system needs good circulation in order to perform at its best for you.
- Optimize your vitamin D levels. Vitamin D deficiency is the likely cause of seasonal flu viruses. Getting an optimal level of vitamin D will help you fight infections of all kinds.

- Get plenty of good quality sleep.
- Deal with stress effectively. If you feel overwhelmed by stress, your body will not have the reserves it needs to fight infection.
- Wash your hands. But not with an antibacterial soap. Use a pure, chemical-free soap.

Mercury Awareness Raising Package

UNEP, 20 July 2009
https://web.archive.org/web/20090720063724/http://www.chem.unep.ch/MERCURY/awareness_raising_package/default.htm

This publication is intended to raise awareness amongst stakeholders of the effects of mercury on human health, wildlife and the environment and on relevant strategies to manage and control mercury. It is designed for the use of government officials, community leaders, and/or workers to provide information and raise awareness about mercury and the associated environment and health risks. It is intended to contribute in building public support and capacity to take preventive actions.

The document can be used in a number of ways: for reference, to train staff, to present or hand out as copies directly from the toolkit, to develop materials specific to your community.

THE FLU CASE

UNEP: No safe Mercury level in the Human Body

The Flu Case, 30 November 2009, 11:16
https://web.archive.org/web/20100102021109/http://theflucase.com/index.php?option=com_content&view=article&id=2118%3Aunep-no-safe-mercury-level-in-the-human-body&catid=1%3Alatest-news&Itemid=64&lang=en

The WHO has recommended swine flu vaccines with mercury in spite of statements by the *United Nations Environmental Programme* (UNEP) warning about the toxicity of the metal.

According UNEP's mercury homepage: "There is no safe way to use mercury and scientists have found no safe mercury level in the human body"."

UNEP advises the public to "Be aware of dangers of mercury and the risks of mercury use!" and also: "Help raise awareness about mercury exposure risks with your family and in your community."

"There is limited awareness of mercury in medicines. Continued, repeated use of these products is a human health risk", UNEP states in the UNEP MERCURY PROGRAMME, Awareness Raising Package:
https://web.archive.org/web/20090720063724/http://www.chem.unep.ch/MERCURY/awareness_raising_package/default.htm

In a section "Mercury Use in Healthcare Settings and Dentistry" UNEP makes it clear that using alternatives that are not made of mercury is "safe": "Mercury compounds are found in certain preservatives, fixatives and reagents used in hospital laboratories and as preservatives in multi-dose vaccines in which bacterial growth needs to be suppressed."

But according to UNEP "There are safe and cost-effective non-mercury alternatives for all uses of mercury in health care".

Given this evidence and recommendating, why is WHO pushing on populations swine flu vaccines with mercury at all?

Dangers in the shots: Components of H1N1 vaccines

Jeff Rense, 4 August 2009
https://rense.com/general86/dngers.htm
https://whoflu666canada.wordpress.com/category/uncategorized/

Part 1.

Please note: As of August 1, 2009, no long-term, independent safety trial studies have been done for any of the different and new flu vaccines that are supposed to be given/forced on all Americans -whether we want them or not. , After the World Health Organization [WHO] declared a Level 6 "pandemic" on June 11, the US government has mandated that all Americans over the age of six months be vaccinated. Although WHO cannot technically interfere with the internal laws of the US, they can and already have put enormous pressure on our government (and, thereby, our own laws) to require all citizens to get these toxic vaccine shots. There are to be no exceptions to this new illegal US ruling. Further, WHO is not even tracking the actual number of laboratory confirmed cases of H1N1. So, how can it be called a "pandemic"? This year's flu is mild.

There has been a tremendous rush (called "fast-tracked") to get these vaccines on the market. The tests they have done were only a few days to a few weeks long. This is totally insufficient time to determine any realistic, long-term, and potentially hazardous immune responses. Nothing has been done in any responsible manner. There is absolutely no Precautionary Principle (first do no harm) in place. What we have, first and foremost, are both out-of-control greed and scare tactics. These are directed to uninformed citizens, while the international pharmaceutical companies will make billions of dollars, with the very real potential of enormous harm to millions of victims is looming ever closer.

We all are their experimental lab rats. There is no concern about harming or killing anyone, because the companies (GlaxoSmithKline, Baxter, and Novartis, and others) have been indemnified by the government, so thatthere is absolutely no recourse for any deaths or injuries these vaccines may cause. Why would they do that, if these vaccines were safe? What secret and criminal plans were done behind closed doors to hatch this real X-Files plot? From investigative reports by Jane Burgermeister, Dr. A. True Ott, and Canadian doctor Ghislaine Lanctôt (author of "Medica Mafia"), it appears that there is criminal collusion between officials in the US government, WHO/UN, and the pharmaceutical corporations.(1)

In a call yesterday to a friend who is a doctor in California, she told me ominously: "60% of Americans could die from these vaccines." Is this what lies ahead for us in the next few months? 12,000 children ages 3-12, will be guinea pigs for these flu vaccines. It is unethical and unconscionable. To possibly rig the results, the children will be getting injections of different vaccines than will be delivered to the rest of the population this Fall. Is this the cesspool that is hijacking our country? Do we all go -lost in our daily routines, refusing to wake to the grave consequences that face us!– merrily down a path leading to such Orwellian destruction?

Here are some historical reminders of past flu epidemics. They were all contrived and created in some hidden laboratory.

The vaccine used in the mandated 1976 supposed swine flu "epidemic" caused the deaths of 2,000 people before it was removed; and 4,000 filed injury law suits. Before that, it was the Salk polio

vaccine, also fast-tracked with $9-million of tax-payer money, to inoculate 57-million Americans before it was even proved to be safe to use. And it wasn't. African green monkey kidney tissue was used to grow the polio virus; and it proved to have long-term and deadly effects. In 1955, the "British Medical Journal warned against the used of the Salk polio vaccine."(2) The warning, and there were others as well, was ignored. Before genetic engineering opened a Pandora's Box, this vaccine "was an uncontrolled experiment in interspecies viral transmission."(3) Long-term, but not known then (in the financial rush to get this vaccine produced), the use of this monkey's tissue was to be the cause of cancers detected much later. This cancer-causing monkey virus, known as SV40 (still debated in some medical circles) is documented in "The Virus and the Vaccine: The true story of a cancer-causing monkey virus, contaminated Polio Vaccine, and the millions of Americans Exposed."(4)

There are countless stories of vaccinations causing death, seizures, and other permanent injuries. Over many years, Robert F. Kennedy's has waged a valiant campaign about the dangers of vaccines. His article about what he calls "Deadly Immunity" has been re-printed just this past week.(5) It is yet another reminder of a path continuously trodden by rapacious multi-national corporations, and always with grave consequences that the public bears. Manufacturing vaccines has now become a multi-billion dollar investment by international pharmaceutical corporations. With this enormous investment, there is total lack of precaution. Money trumps safetyevery time. Now, we are talking about millions of people getting vaccinated without any safety data or long-term studies. We are the guinea pigs. Again and again.

Who benefits from all this? Follow the money trail. Novartis will receive from the US HHS [Health and Human Services] $346-million for antigen and $348.8-million for adjuvant. They also have orders from 30 other countries. Baxter has orders from five countries for 80-million doses, but has not received FDA approval. GlaxoSmithKline has received $250-million to supply the US with various "pandemic products." This is not small change; and more vaccine purchases are planned. Dr. Mae-Wan Ho and Prof. Joe Cummins, in their new article (see below), report that the total US vaccine figure for these orders amounts to $7 billion. From where is this money supposed come, when the United States is actually bankrupt (yet printing worthless fiat dollars)?

In a lengthy article posted on July 27, the distinguished British geneticist and biophysicist Dr. Mae-Wan Ho and biologist Prof. Joe Cummins have written that "Vaccines themselves can be dangerous, especially live, attenuated viral vaccines or the new recombinant nucleic acid vaccines, they have the potential to generate virulent viruses by recombination and the recombinant nucleic acids could cause autoimmune diseases. A further major source of toxicity in the case of the flu vaccines are the adjuvants, substances added in order to boost the immunogenicity of the vaccines. There is a large literature on the toxicities of adjuvants. Most flu vaccines contain dangerous levels of mercury in the form of thimerosal, a deadly preservative 50 times more toxic than the mercury itself. At high enough doses, it can cause long-term immune, sensory, neurological, motor, behavioural dysfunctions. Also associated with mercury poisoning are autism, attention deficit disorder, multiple sclerosis, and speech and language deficiencies. The Institute of Medicine has warned that infants, children, and pregnant women should not be injected with thimerosal, yet the majority of flu shots contain 25 micrograms of it."(6)

It should be noted that Dr. Mae-Wan Ho is the Director of the prestigiousLondon non-profit organization, the Institute of Science in Society [ISIS]. She has written several important books and, for more than a decade, also has been writing about the dangers of genetically engineered organismslong before anyone was writing about these issues in the US. This ISIS article is absolutely essential reading for anyone who wants additional and unbiased background information on the questionable safety of these flu vaccines.

In order to be well informed, there also are other important questions that we all must ask every public official. (1)What vaccines are actually going to be used? There are numerous websites that list ingredients for all the pharmaceutical companies involved in this multi-million dollar so-called "pandemic." Far too many of the ingredients listed are highly toxic. Some vaccines are not

recommended at all for children. (2)How many injections are going to be forced on children (some reports say four!) and adults? If this goes forward in the Fall, using schools as medical clinics, how will parents know what is in these vaccines? Given the governmental immunity for the pharmaceutical companies, what recourse does anyone have for serious immune damage or death from these vaccines?

These extremely dangerous vaccines are classified as bioweapons by the US government's own definition.

Note: Adjuvants are added to all vaccines to make dispersal faster and easier in the body (but not more safely). It affects the "action of the drug's active ingredient." It also then requires less adjuvant, so the product then can be expanded to cover many more vaccinations with less vaccine. This also means a faster production of vaccines, and more money for the drug companies with less production output of vaccine. However, the trial tests this month on children will not contain a squalene adjuvant, even though it is an ingredient in all three of the vaccines listed below. According to Jane Burgermeister's July 29 report, these three companies "will conduct their own trials under secret contract with Health and Human Services."(1, see her website) Why are they secret, when our lives are all at such risk? Again, there is a long history of rigged trials [the outcome always favoring the company, and rarely emphasizing the serious health risks and toxicity], especially when conducted by the same company that will produce a drug.

The following is an incomplete (but significant) list of vaccine ingredients: GlaxoSmithKline Plc based in London Vaccine Ingredients: Aluminum adjuvant: an aluminum-containing compound. It releases the antigen [an active substance that is capable of generating an enhanced immune response from the body, and then reacting with the products from that response], causing strong, enhanced antibody response -what Dr. Mercola calls a "turbo charge" to the body's immune system. It has been linked to Gulf War Syndrome that has caused tremendous permanent damage to thousands of military.(7) Aluminum is a known cause of cognitive dysfunction.

- AS03: The company's proprietary squalene adjuvant. (See: squalene below)
- Daronrix: Glaxo's H5N1 bird flu vaccine.
- Disodium phosphate: a white powder, water-soluble salt. It is used as an anti-caking additive in powdered products. This inorganic chemical is also used as a fungicide and microbiocide.
- Formaldehyde: a known carcinogen and reproductive or developmental toxicant. Interestingly, according to PANNA, in 2007, California used 30,328 pounds of this carcinogen, as a microbiocide [a drug or other agent that can kill microbes] on the top 50 crops grown in the state.(8)
- Octoxynol 10: (Also known as Triton X-100) A detergent, emulsifier, wetting and defoaming agent. [Octoxynol-9 is a spermatocide.] It can alter metabolic activity, damage membranes, and cause a rapid decline in cell function.
- Polysorbate 80: Also known as Tween 80. It is used as an emulsifier in cosmetics, and is one of the ingredients in Gardasil, the cervical cancer vaccine that is being mandated/promoted for teen-age girls. This ingredient is known to cause infertility, grand mal convulsions, spontaneous abortions, and life-threatening anaphylactic shock. So far, 28 Gardasil deaths have been reported.
- Sodium Chloride: Refined table salt. Salt is a naturally occurring complex mineral that balances the water inside and outside our cells. Refined salt, sodium chloride, is chemically treated and contains many other hidden chemicals that destroy natural salt's healing abilities. The body can get most of its daily requirement by eating a well-balanced, organic diet –eliminating processed foods. A good source is untreated, natural sea salt.
- Squalene: A natural oil found in sharks (mostly found in their livers) and humans. The American Journal of Pathology (2000) reported that ratsinjected with squalene triggered "chronic, immune-mediated joint-specific inflammation," -i.e., rheumatoid arthritis. How will this affect people who already have an immune inflammation, or will it cause untold new cases (lupus, chronic fatigue)? Squalene is being added to all new vaccines. It is linked to the thousands of military who have contracted "Gulf War Syndrome" and have suffered irreparable auto-immune damage, including lupis, multiple sclerosis, fibromyalgia, and rheumatoid arthritis.(9)

- Thimersol: (MERCURY). Put in all multiple doses of vaccines. Any amount of mercury is highly toxic. There is no safe level. This is has been repeatedly linked to the increasing rates of autism, multiple sclerosis, and ADD.(10)
- Vitamin E: This anti-oxidant vitamin helps protect the body's red blood cell functions, and helps to oxygenate our tissues. The best sources are from organic, cold-pressed vegetable oils, such as wheat germ, sunflower seeds, and safflower. Vitamin E from corn or soybean oil now often comes from genetically engineered sources.

Baxter International Based in Chicago. Called "Celvapan" or its common name: pandemic influenza vaccine [H5N1]

Note: Adverse reactions include: headaches, dizziness, vertigo, nasopharyngitis, chills, fatigue, malaise, injection site pain. There is "no data on Celvapan vaccination dose and schedule for subjects under 18 years of age" and for subjects who are immuno-supressed. Vaccine Ingredients: African Green Monkey: Cultured cells are taken from this species of monkey through a process called "vero cell technology." This species of monkey (and the tissue derived from it) have been implicated in transmitting several viruses, including HIV and polio. Baxter has "applied for a patent on a process using this type of cell culture to produce quantities of infecting virus, which are harvested, inactivated with formaldehyde and ultra violet light, and then detergent. Baxter has produced H5N1 [bird flu] whole virus vaccine in a Vero cell line derived from the kidney of an African green monkey."(11) According to Dr. Mae-Wan Ho and Prof. Cummins, "details of the production of this vaccine have not yet been released to the public."

Whole virus (H5N1) influenza vaccine, vero-celled derived. (See above.)
- Trometamol: Also known as Tris (or Tris buffer) or THAM. An organic compound used as a buffer. May be harmful if inhaled. Avoid contact with eyes, skin, and clothing. Long-term effects: no data. Ecological information: no data.(12)
- Sodium chloride, Polysorbate 80, and water [what kind? tap? fluoridated? chlorinated?] for injection.

Novartis International AG Based in Basel, Switzerland. Called "Focetria" or its common name: pandemic influenza vaccine. Licensed May 8, 2007.

Note: Adverse reactions include: headaches, sweating, joint pain, fever malaise, shivering, and pain at injection site. Vaccine Ingredients: Virus: The company is using a proprietary cell line. [Unknown is whether they are using dog or green monkey tissue.] By using this process, instead of growing the virus strain in chicken eggs, it "has cut weeks off the time required to begin vaccine production [to be done at its cell-based facility in Germany."(13) According to the European Assessment Report (May 2007), "Focetria should not be given to patients who have an anaphylactic reaction (severe reaction) to an of the components of the vaccine, or to any substances found at trace levels in the vaccine, such as egg, chicken protein, kanamycin, or neomycin sulphate (two antibiotics), formaldehyde, cetyltrimethylammonium bromide (CTAB, a disinfectant used to sterilize utensils and instruments) and Polysorbate 80." The CTAB Material Safety Data Sheet notes that its "chemical, physical, and toxicological properties have not been thoroughly investigated" but it "is irritating to mucous membranes and upper respiratory tract."(14) PANNA also lists this as an herbicide and microbiocide.

- Squalene: see above.
- MF59: A proprietary oil-based adjuvant that and contains (according to Dr. Mae-Wan Ho and Prof. Cummins's ISIS article, already cited) Tween 80, Span85, and squalene. The authors also note that MF59 has "substantially higher local reactogenicity and systemic toxicity than alum." This adjuvant is part of a new generation of potent vaccine enhancers. In their book, "New Generation Vaccines" authors Levine, Kaper, Rappuoli, and Good note that "The precise mechanisms of action of most adjuvants still remain only partially understood."(15) Animal rat studies using oil-based

adjuvants have demonstrated severe reactions to them, including paralysis, crippling, auto-immune disorders, and severe arthritis, and immune system impact. The FDA has yet to approved this for used in any vaccine, according to Jane Burgermeister's July 29 online report (previously cited).

- Span85: Patented by the now defunct Chiron (bought by Novartis). Its chemical name is Sorbitan Trioleate. It is an oily liquid used in medicine, textiles, cosmetics, and paints as an emulsifier, anti-rust agent, and thickener. [Some factories in China specialize only in manufacturing Tween 80 and Span 85.] According to the Pesticide Action Network North America [PANNA], this chemical is used as a pesticide. It is also used as an adjuvant and is "toxic to humans, including carcinogenicity, reproductive and developmental toxicity, neurotoxicity, and acute toxicity."(16)

Update 1:

For those in mainstream: The International Swine Flu Conference will be held in Washington, D.C., Aug. 19-20. Further information is at:www.medicalnewstoday.com/articles/159085.php and http://www.New-Fields.com/isfc.

Update 2:

In a July 23 report, the National Vaccine information Center (NVIC) is calling on all public officials "to provide evidence that it is necessary to given experimental swine flu vaccines to children in schools and that strong mechanisms for vaccine safety screening, recording, monitoring reporting, and vaccine injury compensation are in place." At present none of these are. NVIC, founded in 1982, has been committed to being a vaccine watchdog, and questions the need to turn schools into medical clinic this fall." Further information is at: ww.medicalnewstoday.com/articles/158586.php and www.nvic.org//NVIC-Vaccine-News/July-2009/Swine-Flu-Vaccine-Should-Not-Be-Given-to-Children.aspx

The deliberate rush and fast-track to get these untested vaccines ready in millions of doses, precludes any real sense of precaution and safety. There is no concern about how much very real damage, permanent debility, and death will be caused by them. On June 11, 2009, the World Health Organization [WHO] raised its pandemic level from 5 to 6 --the highest level. In the ensuing six weeks, there has been the most frantic pace by all the pharmaceutical companies to get millions of untested and unsafe vaccines to market, after all, they will be making enormous amounts of money.

Then, just a few days ago, Dr. Keijo Fukuda, WHO's flu chief, warned about the potential dangers of these different kinds of vaccines, saying: "There are certain areas where you simply do not try to make any economies. One of the things which cannot be compromised is the safety of the vaccines." (17) Safety? This statement is a bit tardy in coming. At this point, can anyone at the WHO be believed? Trusted? Why was this not the very first thing WHO addressed in May and June, before they rushed to declare a Level 6 "pandemic" (without proof)?

In another unconscionable rush, on July 23, the Food and Drug Administration (FDA) was reported "likely to approve 2009 H1N1 (swine flu) vaccines before trial data can prove their safety and effectiveness against the virus."(18) Again, where are any ethics, real safety, caution, or precautionary principle in place? It appears that there is continuing evidence from numerous sources (not just these in this article) repeatedly showing evidences of planned harm to all of us.

The issue of dangerous and deadly pharmaceutical vaccines rushed to market is not an issue that has been created in isolation. Rather, it is part of a whole, and unethical, and completely corrupted system, that is wrecking our country. We are being deliberately assaulted by one crisis after another, precisely as Naomi Klein has written in her brilliant book, "The Shock Doctrine." The looting and destruction of our country has been done, bit by bit, over many decades by selected elite insiders, while we (and our parents, too) were basking in a glow that had nothing to do with what was really happening behind the scenes in secret meetings of presidents, Congress, the Judiciary, and other high officials, along with corporate executives.

Now, however, this financial looting as well as the destruction of our Constitutional laws has accelerated enormously over the last nine years. It is all part of the elite's NWO-plan to wreck our country, destroy what remains, and have those in charge do it right in front of our own eyes. This is the

unmitigated hubris of the criminals in charge. Here we are at the brink of a pharmaceutical-military take-over. Our own government is complicit in this! Are we still so comatose and/or so heavily poisoned – from ten years of Chemtrail aerosols and the massive pollution from 100,000 mostly untested chemicals that surround our every move-- that we do not see or understand what is happening? If these deadly vaccines don't kill us, then ten years of our entire population being assaulted daily from these highly toxic aerosols and chemicals has already immensely weakened our immune systems. It is the proverbial one-two punch.

We Americans have not known real chaos on our soil since the Civil War - that was 148 years ago. This is not within our own human memory. It belongs to our great-great-grandparent's era. The 1960's and Watts Riots were tragic, but they did not engulf the entire United(?) States. Now, with all the illegal laws passed (but not even read) by a complicit Congress --no longer working "for us," but, truly against us-- we face a tremendous, epic crisis. Moreover, the deliberately created, but non-existent scare-tactic diversion "pandemic" really is a mask for the bankruptcy and on-going theft of our tax-payer dollars. No accountability to the Federal Reserve, while they steal trillions of our dollars. No accountability to the pharmaceutical companies for the real potential of irreparable harm or death from untested and dangerous vaccines. Do we get the connection? Stealing our own tax-payer trillions of dollars, the Federal Reserve is not accountable to anyone, while the country goes down the drain, due to the chaos they have deliberately created. The pharmaceutical companies are indemnified, while they manufacture highly toxic, untested drugs. The government officials approve of this. No one is held accountable. Nonetheless, WE, THE CITIZENS, are put in mortal fear about this non-existent but contrived "pandemic." This is criminal.

There is a long and dirty history of pharmaceutical companies manufacturing dangerous, often poorly tested drugs. Repeatedly, we have been the guinea pigs for one dangerous drug after another, while the drug companies took in millions of dollars. It's a sordid history -everything from thalidomide, to DES [diethylstilbestrol, a synthetic estrogen hormone], to Vioxx. Problems were covered up. Test results were falsified. Reports conveniently disappeared. Conflicts of interest are frequent. Scientists were paid off. There continues a revolving-door policy where employees of drug companies leave their jobs, only to be employed by government agencies. More recently, we now have a vast commercialization of medicine and drugs with all the radio and TV ads. For decade after decade, we have been expendable for enormous corporate profits. Our well being, our safety are never part of the corporate equation. Their bottom line is always profit. All of us continue to be expendable for that. Think about that, as 12,000 of our [I write "our" in a collective sense, as we are all responsible to one another] young children are going to be given an untested vaccine(s?) this month. Our young and innocent children are going to be the latest guinea pigs. This vaccine is not even the same one that will be forced on the rest of us this Fall.

Does any of this sound ethical? Does it sound criminal? The massive governmental corruption we see all around us is perhaps even worse than in the ancient Roman days of Caligula.

Where are Our Rights?

There are also basic human rights that are deliberately and completely ignored. Where is our right to choose? Where are our supposed legal and Constitutional rights? We have the right to live in peace, without being deliberately harmed or provoked, by the threat of Martial Law. There has been an illegal and unlawful build-up of troops and military exercises (the latest just this past week), on our own soil that is a violation of the Posse Comitatus Act of 1878. In the next few months, we are about to face our own American soldiers who have killed and maimed indiscriminately in Iraq and Afghanistan. These soldiers will now probably be deployed to accompany FEMA to come door-to-door into our homes to force us to take these poisonous injections. Can you envision what that means? Our own military is being ordered to possibly attack us in our homes [what else can it be called?] for more lies! Jim Kirwan's latest online essay is so right on! He sees clearly how damaged the returning soldiers are!(19) These are US troops who, in all probability, have been given toxic vaccines [as they had been during the Gulf War] and mind-

altering drugs, so they are doped and hardened to the reality of harming or killing us. This is what Professor Michel Chossudovsky calls the "militarization of health."(20)

We have the basic and universal right not to be deliberately harmed by our own government, or used as unwilling laboratory subjects for completely untested and dangerous vaccines. It is inhuman and in total contravention of all international laws to deliberately cause grave harm or death to citizens. This is what the Nazis did. The United States is now a rogue country that ignores basic universal human rights. Massive greed and collusion-to-cause-untold-grave-harm have taken its place. Where our own innocent, young children are used as test subjects, where our government puts us all in harm's way, where we are threatened with internment in FEMA concentration camps, if we refuse to be compliant and be injected with poisons, while nothing of basic humanity remains from any public official.

A democratic country honors and upholds its own laws and those of the international community. It does not attack, unprovoked, other countries. A democratic country holds its citizens in esteem and protects them: their lives and "promotes the general welfare." A democratic society has officials who honor their oaths of office. A truly democratic society respects the individual, supports education, and encourages peaceful domestic growth. Its legislative branch is open and honest, and does not collude to harm its citizens. Children grow up content and secure. They become well-educated citizens (not shoppers). The country thrives and can set an example for others. Peace reigns. Neighbors live in tranquility. The Common Good is held in high regard. Laws are upheld. Justice pervades. Truth is sacred.

Whatever lies are being promulgated by a corporate-controlled and compliant media, there is no real investigative journalism left. There is no search for the truth. What we have now every day is Orwellian Doublespeak, while the entire population of the United States is at grave risk of enormous physical harm.

This is not the country in which I grew up. Now, there is a complete lack of any moral direction or ethical boundaries. The government has broken its social and legal contracts with its own citizens. A government that can put all of its citizens deliberately in harm's way, is unfit. We are living in a police state, just the façade remains, while the great majority of Americans do not realize what tremendous destruction is right before us. A military state places all its financial and governmental power on killing and massive harm. This is what our violent country has done. In the last nine years, it has illegally attacked three countries (Afghanistan, Iraq, and Pakistan and has given military assistance to Israel to attack the civilian citizens of Gaza with depleted uranium bombs...this, too, is illegal under international law).

Violence is epidemic throughout our society. Children kill their peers; and our prison population (the largest of an Western country) is a tragedy. The movies are replete with one violent film after another. When violence and killing take priority in society [our budget and prison population], this is where we find ourselves as a bankrupt country. The bankruptcy goes far deeper than just the financial aspects. It goes to the core of our lost values. If many of us still believe in ethics, truth, and honorable behavior, those running the country do not exemplify our own personal values. The disconnect is tremendous.

At the same time, all our social services are trashed. No money for education. No money for elder care. No money for almost 50-million Americans who have no medical coverage. No money for the entire health and well-being of our citizenry (except for the rich). It is a complete disgrace. Yet, elite corporate power is destroying our ecnomy. Businesses are being gobbled up by larger ones (even if they are bankrupt), while millions are out of work. Banks are told not to lend to their customers who are trying desperately to hold on to their homes.(21) There is no money for crumbling bridges and disastrous, pot-holed roads across the entire country. I speak from personal experience, as I drove back and forth across the United States last year. Toll roads have increased as have the toll fees; but the roads are wrecked. There is hardly any money for the massive amount of real infrastructure repairs needed. In our financially bankrupt country, there is always fiat money for killing. There is

no money for any social services -the very backbone of a healthy society. Our entire economic structure is a planned wreckage!

The US has billions of tax-payer dollars for every kind of weapon, and bomb, and illegal DU bombs, and hi-tech military drones or sophisticated stealth weaponry, but our social services are completely cut to the bone. This is not a healthy society. It is a poorly educated and very sick one: and it shows from 40-million obese people to epidemics of cancers, and massive multiple immune illnesses. Our tax-payer trillions of dollars have been deliberately stolen from us to pay salaries of bankrupt CEOs, trillions have gone into some deep hole and are unaccounted for; and yet, the Federal Reserve (a private bankster cabal) refuses to answer any questions, as to where our money has gone. It is fraud. They are above the law. This is highway theft of unimaginable proportions. It is criminal. But, again, there is no accountability.

The irreparable damage done to hundreds of thousands of soldiers who have returned from killing innocent civilians, under both bushes, is staggering. They are maimed for life. They are unstable killers. They are damaged by squalene containing vaccines (Gulf War Syndrome) that they are given. These are the soldiers who return to either do more harm here, or are hospitalized or mutilated for the rest of their lives. Jim Kirwan writes of the tragic wrecked lives of these soldiers. This is what happens when warfare is glorified and violence is culturally epidemic.

Once upon a time, at the end of another war (WWII), the United States was hailed and admired [if we leave aside all the political and historical lies that Americans were fed then]. We were industrious, we were far more well educated. We stood for ethical values and doing the right thing [at least most Americans believed that, even if secret dealings were already under way to destroy our country from within]. Now, our ratings have plummeted: politicians work for secret groups and corporations. The very core is so rotted; but mostly still unknown to the average American.

This is where we are right now. We have had our liberties stolen from us. We have had our democratic institutions stolen from us, by those in charge. We are at the brink of even the loss of our very own lives -all under the guise of protecting us from a non-existent "pandemic." Genetically engineer the flu in some bioweapons lab, and the create debilitating and deathly vaccines that will do further harm to everyone. Chief Seattle can still remind us "what we do to ourselves, we do to the web of life."

The system – "health"(sic), politics, economics – is all rigged to do us extreme harm. The government is broken, and completely disassociated from the social construct upon which our nation was originally founded. Much of it now is being run into the ground by elements with criminal ties and intent. They have created this "pandemic" that is the set-up governmental pretext and smokescreen for the actual financial destruction of our country. It is another colossal "false flag" scenario that will engulf us all with disastrous results. Think of all the lies we have been repeatedly told and the ramifications that have resulted from this created 8-year deception -all surrounding the "official version" of the tragedy of September 11, 2001. We, the people, continue to be expendable not just for corporate profits but also for a political agenda created to harm us in the extreme.

Do we want death by injection? Is this what we want for our children and grandchildren?

Daily Camera

Most flu shots contain mercury, but few know it

Daily Camera, 14 August 2009 at 2:40 p.m.
https://www.dailycamera.com/2009/08/14/most-flu-shots-contain-mercury-but-few-know-it/

A record 130 million Americans are expected to get a flu shot this season in hopes of ducking the nasty virus, but as the needle pierces the skin, more than 80 percent will also get what some say is a hefty and dangerous dose of mercury.

The U.S. Centers for Disease Control and Prevention recommends that almost everyone – including pregnant women – get the injection, despite written warnings from the vaccine manufacturers.

Citing an estimated 36,000 deaths a year from the flu and flu-related illness, the mainstream medical community, including the American Academy of Pediatrics and American Lung Association, says the benefits far exceed any risk from the shot.

In a typical year, between 5 percent and 10 percent of the population will get the flu virus, resulting in roughly 200,000 hospitalizations, according to the CDC. The flu can be especially dangerous for very young children and people 65 and older. Elderly people account for about 90 percent of all flu-related deaths.

Simply stated: The flu shot saves lives, the CDC says.

Yet a growing number of doctors, scientists and citizen organizations, such as Safe Minds, the Coalition for Mercury-Free Drugs and Moms Against Mercury, say mercury in flu shots has not been proved to be safe and can be linked to neurological disorders and other serious problems. They push for mercury-free shots that are available in limited quantities but that few know about.

"Mercury causes tremendous damage to the brain," said Paul King, scientific adviser for the Coalition for Mercury-Free Drugs. Mercury is among the most toxic heavy metals and is known to poison the central nervous system, liver, gastrointestinal tract and other systems in the body. About 80 percent of all flu shots distributed in the United States contain a mercury-based preservative called thimerosal. Thimerosal consists of 49.6 percent ethyl mercury, an anti-bacterial, anti-fungal that allows manufacturers to sell the vaccine in large, multi-dose containers without fear of contamination.

The Environmental Protection Agency and federal Food and Drug Administration have not set an exposure limit for ethyl mercury. –

The federal agencies have, however, set exposure limits for another organic and closely related form of mercury, methyl mercury – the type that comes from coal-fired power plants and is found in fish. They use that standard when estimating the safety of ethyl mercury.

Doctors and scientists debate the differences of the two forms in terms of how they affect the brain and body, but all agree: Both are toxins. A typical 0.5 milliliter flu shot contains 25 micrograms – or 50,000 parts per billion – of mercury.

The EPA classifies a liquid with 200 parts per billion of mercury as hazardous waste. The limit for drinking water is 2 parts per billion.

Using the standards set for methyl mercury consumption – the kind that's in fish – an average 130-pound person getting the flu shot would exceed the daily limit by more than four times. A 22-pound baby would get more than 25 times the amount of mercury considered safe. And doctors are recommending that many babies and children get two flu shots this season.

A material safety data sheet from Eli Lilly and Co., which no longer makes a flu vaccine, says effects of exposure to thimerosal may include "fetal changes, decreased offspring survival and lung tissue changes. … Exposure in utero and in children may cause mild to severe mental retardation and mild to severe motor coordination impairment."

It does not state at what levels of exposure these consequences could occur.

The CDC and National Institutes of Health have commissioned a number of studies looking at vaccine safety and any links vaccines might have with autism. In 2001 the Institute of Medicine reported that the evidence was inadequate to say whether thimerosal caused autism or other disorders. The issue warranted further investigation, the report stated.

Several other studies followed. In 2004, the Institute of Medicine reported that it couldn't find a causal relationship between thimerosal-containing vaccines and autism.

This September, another study published in the New England Journal of Medicine was unable to prove a causal relationship between early exposure to thimerosal and neuropsychological outcomes in children ages 7 to 10. It did not address possible links with autism.

Amid all the uncertainty, and considering that mercury is a known neurotoxin, several states, such as California, Illinois and New York, have banned thimerosal in vaccines – including the flu shot – given to young children and pregnant women.

Yet every day, in grocery stores, fast-food restaurants, pharmacies, at work and elsewhere, people are bombarded with the message to "Shoo the flu" and are repeatedly told "the best way to beat the flu is to get a flu shot."

Nothing is ever mentioned about thimerosal.

Nothing is ever said about the manufacturers' warnings for pregnant women.

In late October the American College of Obstetricians and Gynecologists reminded all pregnant women to get the flu shot.

Yet the country's largest maker of the flu vaccine, Sanofi Pasteur, in its own literature distributed in package inserts with the vaccine, specifically states:

"Animal reproduction studies have not been conducted with Influenza Virus Vaccine. It is also not known whether Influenza Virus Vaccine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Influenza Virus Vaccine should be given to a pregnant woman only if clearly needed."

Other flu vaccine makers include similar warnings in package inserts for both types of flu shots. Novartis, maker of Fluzone, goes on to instruct that the "clinical judgment of the attending physician should prevail at all times in determining whether to administer the vaccine to a pregnant woman."

Yet physicians aren't present at most flu clinics. So, many, such as Aurora Health Care's Visiting Nurse Association, rely on information from the federal government and medical associations.

"The CDC recommends all pregnant women get them," said Lisa Taylor, a registered nurse and clinical coordinator for Aurora Health Care's Shoo the Flu program, which will vaccinate an estimated 90,000 people around southeastern Wisconsin this season.

The CDC cites one study supporting its claim that the vaccination is safe for pregnant women – a 1973 study designed primarily to look at tumors in children up to 1 year old whose mothers received a

polio vaccination. It included a sentence stating that one child of more than 2,000 mothers vaccinated with the flu vaccine had a spinal cord tumor.

"It's ridiculous," said David Ayoub, a physician and medical director of Springfield, Ill.-based Prairie Collaborative for Immunization Safety, a group concerned about mercury in vaccinations. "It's a big, big deception.

"Half the kids could have died, but the study never would have shown that because they were specifically looking for tumors," said Ayoub, co-author of "Influenza Vaccination During Pregnancy: A Critical Assessment of the Recommendations of the Advisory Committee on Immunization Practices," published in the Journal of American Physicians and Surgeons in 2006.

Still the CDC defends the study, calling it "relevant" and says other studies also demonstrate the vaccine's safety during pregnancy.

Vaccine manufacturers such as Sanofi Pasteur, MedImmune and Novartis say they're ramping up production of thimerosal-free vaccines but don't have capacity to convert all the flu shots immediately.

Squalene Emulsions for Parenteral Vaccine and Drug Delivery

Molecules, 1 September 2009, 14, 3286-3312
doi:10.3390/molecules14093286 // http://www.mdpi.com/1420-3049/14/9/3286/pdf

Abstract

Squalene is a linear triterpene that is extensively utilized as a principal component of parenteral emulsions for drug and vaccine delivery. In this review, the chemical structure and sources of squalene are presented. Moreover, the physicochemical and biological properties of squalene-containing emulsions are evaluated in the context of parenteral formulations. Historical and current parenteral emulsion products containing squalene or squalane are discussed. The safety of squalene-based products is also addressed. Finally, analytical techniques for characterization of squalene emulsions are examined.

1. Introduction to Squalene and Emulsions

Squalene is widely used for numerous vaccine and drug delivery emulsions due to its stability-enhancing effects and biocompatibility. Emulsions containing squalene facilitate solubilization, modified release, and cell uptake of drugs, adjuvants, and vaccines. Squalene and its hydrogenated form, squalane, have unique properties that are ideally suited for making stable and non-toxic nanoemulsions. Because of these characteristics, numerous squalene-based emulsions have been effectively developed for drug and vaccine applications.

...

6. Conclusions

In summary, squalene has proven effective for numerous vaccine and drug delivery applications due to its unique properties, including high surface tension (allowing small droplet size emulsions), stability, and biocompatibility. Squalene and squalane emulsions allow the solubilization and slowed release of lipophilic drugs, adjuvants, and vaccines, facilitating increased bioavailability and sustained mechanisms of action. Moreover, squalene emulsions demonstrate adjuvant activity such as eliciting increased antibody titers and cell mediated responses in vaccine applications. Finally, there are various established methods for the analysis of squalene and emulsion formulations, allowing thorough physicochemical characterization and stability monitoring. It is expected that squalene and squalane will continue to play a significant role as components in future vaccine and drug formulations.

H1N1 (Swine Flu) Vaccine Mercury Suspension

Washington State, Health, 23 September 2009, 01:08 PM
https://web.archive.org/web/20090928091425/http://www.doh.wa.gov/cfh/immunize/providers/h1n1-thimerosal.htm

Declaration of Outbreak and Vaccine Shortage

On September 23, 2009, the Secretary of Health declared an outbreak of the H1N1 (swine flu) influenza virus and a shortage of mercury-free H1N1 vaccines. The declaration also temporarily suspends the state's mercury limits for certain mercury-containing H1N1 vaccines. The six-month suspension is effective September 23, 2009 through March 23, 2010 and applies only to H1N1 vaccines.

Washington State law allows the Secretary of Health to suspend the state's legal mercury limit for a vaccine if the secretary determines there is an outbreak of disease or shortage of vaccine available to protect the public health against vaccine-preventable disease. =>

See: *Signed Declaration from Secretary of Health Mary Selecky*
https://web.archive.org/web/20090930220831/http://www.doh.wa.gov/cfh/Immunize/documents/suspdeclaration.pdf

Suspension of Mercury Limits

Mercury-free H1N1 vaccine may not be available at all times. The state's mercury limit could prevent pregnant women and children under three years who want the vaccine from getting it. Lifting mercury limits for H1N1 vaccine will give pregnant women and parents or guardians of children under three the option of getting the vaccine if they want it. The suspension applies only to H1N1 vaccines.

- Frequently Asked Questions: Suspension of Thimerosal (Mercury) Limits for H1N1 (Swine Flu) Vaccine (PDF, 48 KB)

Patient Notification

When the mercury limits are suspended, Washington State law requires patients to be notified that they're getting vaccine containing more mercury than is usually allowed if they are:

- Pregnant or lactating.
- The parent or guardian of a child under 18 years getting the vaccine.

Materials to Assist Providers

To assist providers, the Department of Health has created a guidance chart to help providers identify which patients need to be notified and a sample notification that can be used with patients when administering H1N1 vaccine:

- Provider Guidance for Patient Notification (PDF, 117 KB)
- Parent/Patient Notice Sample (PDF, 62 KB)

DECLARATION OF OUTBREAK AND VACCINE SHORTAGE AND SUSPENSION OF RCW 70.95M.115 LIMITS FOR CERTAIN INFLUENZA A (H1N1) 2009 MONOVALENT VACCINES IN MULTI-DOSE VIAL PRESENTATIONS

WHEREAS RCW 70.95M.115 prohibits vaccinating a person who is known to be pregnant or under three years of age with influenza vaccine that contains more than 1.0 microgram of thimerosal per 0.5 milliliter dose. RCW 70.90M.115(3) authorizes the secretary of the department of health to temporarily suspend those limits if there is an outbreak of vaccine-preventable disease or a shortage of vaccine that complies with the limits.

The H1N1 influenza virus is a new influenza virus first detected in humans in the United States in April 2009. The United States continues to report the largest number of H1N1 cases of any country worldwide. There have been confirmed cases in all states in the United States. Significant illness from H1N1 influenza has continued into the summer across the country. As of September 04, 2009, the Centers for Disease Control and Prevention (CDC) reported 9,079 hospitalized cases and 593 deaths in the United States and its territories. As of September 16, 2009, there have been 171 hospitalized cases and 16 deaths in Washington State. Of the 16 deaths in Washington State, two have been pregnant women. According to the CDC, rates of infection (the number of reported cases per 100,000 population) are highest among people 0 to 24 years old. Rates of hospitalization among children have been highest in children younger than two years of age.

Nationally and within Washington, the spread of the H1N1 influenza virus has continued through the summer. The CDC and the Department of Health anticipate that the incidence of disease and influenza-related hospitalizations and deaths will increase rapidly starting in September 2009. Vaccination is considered the most effective method to stop community outbreaks as well as reduce overall sickness and death

OFFICE OF THE CODE REVISER
STATE OF WASHINGTON

KOMONEWS.COM

Herb Weisbaum

Washington OKs mercury in swine flu vaccine

KOMO News, 24 September 2009, 4:22 pm
https://web.archive.org/web/20090928112418/http://www.komonews.com/news/local/61285622.html#idc-ctools

Olympia, Wash. - The state Health Department *will allow more mercury* than usual in some of the swine flu vaccine to make sure shots *are available to pregnant women and children under age three*.

The department says mercury-free swine flu vaccine may not always be in stock, so it wants to give people the choice of using vaccine with the mercury preservative called thimerosal, which is believed to be safe.

The Centers for Disease Control's Web site says the following about thimerosal:
https://web.archive.org/web/20090925160838/http://www.cdc.gov/vaccinesafety/updates/thimerosal.htm
- "There is no convincing scientific evidence of harm caused by the low doses of thimerosal in vaccines, except for minor reactions like redness and swelling at the injection site.
- "However, in July 1999, the Public Health Service agencies, the American Academy of Pediatrics and vaccine manufacturers agreed that thimerosal should be reduced or eliminated in vaccines as a precautionary measure. Most vaccines for children under six are thimerosal-free."

The suspension of the mercury limit announced Thursday lasts six months and applies only to the swine flu vaccine expected to become available in October.

The temporary measure is needed because there could be a shortage of swine flu vaccine in the state when the first batches of the vaccine are released.

KOMO News has learned that none of the single-dose vials of swine flu vaccine or seasonal flu vaccine, as well as the nasal sprays contain thimerosal. It's only the bigger vials - the ones that have multiple doses - that will have thimerosal.

Under current law, those bigger vials would be prohibited, which is why Secretary of Health Mary Seleck suspended the law - to let them into the state.

"The virus is here. It's making a lot of people sick. We're already seeing absenteeism in schools. We know that the virus has some unfortunate health effects on some populations. So we really want to make the vaccine available," she said.

Selecky points out that the H1N1 shot is voluntary.

"And we'll make sure that those who are pregnant women and parents with children under the age of 3 get the information about what's available and what choices they can make," she said.

Here is the priority list of recipients for swine flu shots once the vaccine arrives:
- Anyone age 6 months to 24 years
- Pregnant women
- Healthcare workers
- People under 50 with chronic illnesses

Delayed acquisition of neonatal reflexes in newborn primates receiving a thimerosal-containing hepatitis B vaccine: influence of gestational age and birth weight

J Toxicol Environ Health A. 2010; 73(19):1298-313. Available online 2 October 2009.
doi: 10.1080/15287394.2010.484709. // https://pubmed.ncbi.nlm.nih.gov/20711932/
https://web.archive.org/web/20091023212911/http://www.sciencedirect.com/science?_ob=ArticleURL&_udi=B6W81-4XC57CT-1&_user=10&_rdoc=1&_fmt=&_orig=search&_sort=d&_docanchor=&view=c&_acct=C000050221&_version=1&_urlVersion=0&_userid=10&md5=163a9340a2cb2e9c65b170e058dc21b1

Abstract

This study examined whether acquisition of neonatal reflexes in newborn rhesus macaques was influenced by receipt of a single neonatal dose of hepatitis B vaccine containing the preservative thimerosal (Th).

Hepatitis B vaccine containing a weight-adjusted Th dose was administered to male macaques within 24 h of birth (n = 13). Unexposed animals received saline placebo (n = 4) or no injection (n = 3).

Infants were tested daily for acquisition of nine survival, motor, and sensorimotor reflexes.

In exposed animals there was a significant delay in the acquisition of root, snout, and suck reflexes, compared with unexposed animals. No neonatal responses were significantly delayed in unexposed animals.

Gestational age (GA) and birth weight (BW) were not significantly correlated. Cox regression models were used to evaluate main effects and interactions of exposure with BW and GA as independent predictors and time-invariant covariates.

Significant main effects remained for exposure on root and suck when controlling for GA and BW, such that exposed animals were relatively delayed in time-to-criterion.

Interaction models indicated there were various interactions between exposure, GA, and BW and that inclusion of the relevant interaction terms significantly improved model fit. This, in turn, indicated that lower BW and/or lower GA exacerbated the adverse effects following vaccine exposure.

This primate model provides a possible means of assessing adverse neurodevelopmental outcomes from neonatal Th-containing hepatitis B vaccine exposure, particularly in infants of lower GA or BW. The mechanisms underlying these effects and the requirements for Th requires further study.

THEY FEAR THOSE WITH KNOWLEDGE AND CONTROL THOSE WITHOUT IT

Autism Prevalence Now at 1 in 91 Children, 1 in 58 Boys

Whale, 5 October 2009
http://whale.to/vaccine/autism_prevalence.html

SafeMinds Calls For a Ban on Thimerosal from Seasonal and H1N1 Flu Vaccines in Pregnant Women and Young Children

Monday, October 5, 2009, Reston, VA – Today the Maternal & Child Health Bureau of Health Resources and Services Administration (HRSA), US Department of Health and Human Services released a study evaluating the number of children in the U.S. who currently have a Autism Spectrum Disorder (ASD) diagnosis, The Prevalence of Parent-Reported Diagnosis of Autism Spectrum Disorder among Children in the United States, 2007. The Study evaluated data from a national Survey of Children's Health andfound that 1 in 91 children between the ages of 3 and 17 currently carry an ASD diagnosis -1 in 58 boys.

Even more alarming, for the subset of children between ages 6 and 14 immunized during the 1990's the prevalence is actually 1 in 71 children with an autism diagnosis. This age group represents children in the U.S. with the highest exposure to thimerosal, the mercury preservative routinely used until CDC, AAP and industry recommended its removal "as soon as possible" from all childhood vaccines. Despite this recommendation, mercury, one of the most neurotoxic substances on the planet, is still used in most seasonal and H1N1 vaccines.

SafeMinds continues to call for a ban on mercury-containing seasonal and H1N1 flu vaccines, for pregnant women and young children. Theresa Wrangham, President of SafeMinds stated, "We are especially alarmed by these findings because the seasonal influenza and H1N1 vaccines contain mercury well in excess of EPA safe exposure guidelines. Pregnant women and young children should not be given mercury-containing medicines risking such significant side effects. The precautionary principal demands the removal of thimerosal from all vaccines pursuant to the now decade-old recommendation. How long must we wait to get a known neurotoxin out of all vaccines?"

All flu vaccines are categorized by the FDA as Class C drugs, meaning either studies in animals have revealed adverse effects on the fetus and there are no controlled studies in women, or studies in women and animals are not available. In addition, a 2005 study funded by the NIH found that ethyl-mercury used in vaccines crosses into the brain of infant primates, resulting in appreciable levels of mercury being trapped in the brain.

Concern over vaccine safety and the use of thimerosal is well established. In fact the Institute of Medicine, HHS' National Vaccine Advisory Committee, Congress, Health & Human Service's National Vaccine Advisory Committee, the American Academy of Pediatrics former President Dr. Lou Cooper, and former Director of the National Institutes of Health Dr. Bernadine Healy all agree that current research is inadequate to demonstrate vaccine safety, as required by law, especially in terms of risk for neurological damage, including autism, in a genetically susceptible subset of the population. Most have made statements in support of a study evaluating health outcomes in vaccinated compared with unvaccinated subjects.

SafeMinds is a charitable non-profit and leader in funding and advancing the science regarding mercury exposure as it relates to autism. Our expertise extends beyond mercury-related exposures to broader vaccine safety issues, due to many Board Members holding government agency committee positions such as the Interagency Autism Coordinating Committee, various CDC Vaccine Committees, the Department of Defense Autism Spectrum Disorder Research Program and the National Vaccine Advisory Committee's Vaccine Safety Working Group.

This Statement has been endorsed by National Autism Association, Autism Action Network/ Formerly ACHAMP,

Autism Explodes as Childhood Vaccines Increase

Prison Planet, 5 October 2009
https://web.archive.org/web/20091007231108/http://www.prisonplanet.com/autism-explodes-as-childhood-vaccines-increase.html

Amount of children suffering from brain disorder doubles since last government survey in 2003.

Cases of autism amongst children have doubled since 2003 according to a government survey out today, highlighting once again the direct link between vaccines containing mercury and the brain disorder, as millions more parents give the green light for their kids to be injected with the thimerosal-containing H1N1 shot over the coming weeks.

"While research has suggested that the prevalence of autism spectrum disorders in American children was about 1 of every 150 children, a new government study estimates that the prevalence is more likely about 1 in every 91 children," **reports U.S. News & World Report.**

"The study, which is published in the October issue of Pediatrics, estimated that 110 of every 10,000 U.S. youngsters will be diagnosed at some point in their lives with an autism spectrum disorder. That currently translates to about 673,000 American children with some form of autism, according to the study."

Claims by the CDC and the Institute of Medicine, following a whitewash study that ignored previously verified evidence, that thimerosal, a mercury based preservative, has no causal relationship to skyrocketing cases of autism have been soundly rejected by top doctors and scientists ever since.

Epidemiologist Tom Verstraeten and Dr. Richard Johnston, an immunologist and pediatrician from the University of Colorado, both concluded that thimerosal was responsible for the dramatic rise in cases of autism but their findings were dismissed by the CDC.

Cases of autism in the U.S. have now increased by over 2700 per cent since 1991, which is when vaccines for children doubled, and the number of immunizations is only increasing. Just one in 2,500 children were diagnosed with autism before 1991, whereas one in 91 children now have the disease, up from one in 150 just six years ago.

A peer reviewed study by Dr. Mark Geier which appeared in the Journal of American Physicians and Surgeons showed that the IOM research was flawed because it was largely based on a Danish study by Anders Peter Hviid, which did not account for the fact that American children have a much higher mercury burden than children in Denmark.

"At the high levels (of thimerosal exposure), it is undeniable there is a causal relationship, and we have gone to high levels. Their studies, therefore are not relevant, I am not saying they are wrong, although there are many criticisms of it. It is just not relative to the US situation," said Geier.

Geier's study concludes that there is an increase of neurodevelopment disorders following the use of thimerosal containing vaccines.

Dr. Rashid Buttar, who has pioneered a new treatment for autistic children that removes mercury from their bodies, said the Institute of Medicine's conclusion that mercury does not cause autism demonstrates the "complete absence of any desire to discover scientific truth at the supposed highest levels of medical academia."

"When 31 children recover from a devastating disease by a simple transdermal treatment that detoxifies metals, then common sense dictates that perhaps metals are involved," states Dr. Bob Nash the chairman of the American Board of Clinical Metal Toxicology (ABCMT) in regard to Dr. Buttar's treatment.

"In 1977, a Russian study found that adults exposed to ethylmercury, the form of mercury in thimerosal, suffered brain damage years later. Studies on thimerosal poisoning also describe tubular necrosis and nervous system injury, including obtundation, coma and death. As a result of these findings, Russia banned thimerosal from children's vaccines in 1980. Denmark, Austria, Japan, Great Britain and all the Scandinavian countries have also banned the preservative," writes Dawn Prate.

Mercury is classified by The Department of Defense as a hazardous material that could cause death if swallowed, inhaled or absorbed through the skin, and the EPA is now limiting mercury emissions from factories because the toxin "can damage the brain and nervous system and is especially dangerous to fetuses and small children," but according to the CDC it's perfectly safe to inject into your child's bloodstream.

Despite concerns about thimerosal and mercury, thimerosal is an ingredient of the swine flu vaccine which is currently being rolled out for children all over the country.

"Some of the vaccine will be stored in multi-dose vials containing thimerosal, an antibacterial additive that contains mercury," **reported the Washington Post** in an article about which groups will receive the swine flu vaccine first.

Indeed, the swine flu vaccine contains no less than **25,000 per cent** the amount of mercury considered safe.

Around 12,000 U.S. children were used as guinea pigs for the experimental swine flu vaccine also known to contain the dangerous ingredient squalene, which has been directly linked with cases of Gulf War Syndrome and a host of other debilitating diseases.

Squalene "contributed to the cascade of reactions called "Gulf War syndrome. (GIs developed) arthritis, fibromyalgia, lymphadenopathy, rashes, photosensitive rashes, malar rashes, chronic fatigue, chronic headaches, abnormal body hair loss, non-healing skin lesions, aphthous ulcers, dizziness, weakness, memory loss, seizures, mood changes, neuropsychiatric problems, anti-thyroid effects, anaemia, elevated ESR (erythrocyte sedimentation rate), systemic lupus erythematosus, multiple sclerosis, ALS, Raynaud's phenomenon, Sjorgren's syndrome, chronic diarrhea, night sweats and low-grade fever," according to Micropaleontologist Dr. Viera Scheibner.

Pharmaceutical companies can be assured that they won't face reprisals for the many thousands of injuries and deaths that will inevitably occur as a result of exposing millions to mercury and squalene during a mass vaccination program, because the government has already acted to provide them with blanket immunity from lawsuits.

"Vaccine makers and federal officials will be immune from lawsuits that result from any new swine flu vaccine, under a document signed by Secretary of Health and Human Services Kathleen Sebelius," **reported the Associated Press** in July

Age of Autism

CDC brings bad tidings:
40,000 Children diagnosed with Autism in this Year Alone

Age of Autism, 17 December 2009 at 12:40 PM
https://www.ageofautism.com/2009/12/-cdc-brings-bad-tidings-40000-children-diagnosed-with-autism-in-this-year-alone.html

SafeMinds calls for immediate action from public health officials and implores journalists to ask the tough questions listed here:

Atlanta, GA – A study to be released Friday by the Autism and Developmental Disabilities Monitoring (ADDM) Network of the Centers for Disease Control (CDC) is expected to report that autism prevalence has reached the epidemic rate of 1 in 100 children. The new estimate is for children born in 1996 and represents a 50% increase in just two years over a 2007 CDC calculation of 1 in 150 for children born in 1994.
https://web.archive.org/web/20100111225259/https://www.cdc.gov/mmwr/preview/mmwrhtml/ss5601a2.htm

Approximately 40,000 children will be diagnosed with autism this year alone. SafeMinds calls for cutting edge research now!

The rapid increase in such a short period cannot be accounted for by changes in diagnostic criteria or greater awareness of autism. The children born in 1994 and in 1996 were diagnosed under the same version of the Diagnostic and Statistical Manual (DSM IV), which was issued in 1994 before any of these children were diagnosed (on average, at age 4 years) and has not changed since then. Autism began its sharp growth curve with children born in 1988-1989 – 8 years after autism had been added to an earlier DSM version in 1980. Any increase in awareness would have had an equal effect on children born in 1994 and in 1996. Children born in 1994 and in 1996 would also have been eligible for the same educational services under IDEA, which was revised to include autism in 1990 and has not been changed since then.

Since purely genetic disorders do not exhibit such a rapid change in prevalence, the increase in autism points to environmental factors as the primary cause of autism. “It is imperative that public health officials take immediate and substantive steps to investigate the environmental factors that are most likely driving the autism epidemic,” said Sallie Bernard, Executive Director of SafeMinds.

Notably, expansion of the infant vaccine schedule in 1990 to include a 3-dose Haemophilus Influenzae type B (HiB) vaccine series and a single catch-up dose given to the 1988-1989 children at their 18 month vaccinations doubled the amount of mercury and other injected toxicants. The 1992 introduction of the mercury-containing Hepatitis B (HepB) vaccine series tripled those amounts, and included a dose recommended at birth, a novel step never taken before, even though US infants are at extremely low risk for contracting the Hepatitis B disease, which is spread by sexual contact or IV drug use. The uptake of the Hepatitis B vaccine rose steeply from 1994 to 1996, from 27% of babies in 1994 to 82% percent of babies in 1996 (See Graph). The HepB vaccine is a logical candidate for investigation as playing a key role in the autism increase from 1994-1996.

The HepB vaccine birth dose recently received sharp criticism from advocates after a study by Laura Hewitson, University of Pittsburgh, found that infant macaques given the Hep B birth dose showed statistically significant developmental delays.
Hewitson L, et al. Delayed acquisition of neonatal reflexes in newborn primates receiving a thimerosal-containing hepatitis B vaccine. - J Toxicol Environ Health A. 2010;73(19):1298-313. https://pubmed.ncbi.nlm.nih.gov/20711932/

Government sources and others who promote vaccines tout that the mercury from Thimerosal in vaccines has been studied and claim there is a lack of evidence for a causal relationship. However, those CDC studies compared children who received a routine amount of Thimerosal from vaccines to those who didn't receive quite as much and can be likened to comparing those who smoke two packs of cigarettes a day to those who smoke one pack. No study has ever been conducted to determine the health outcomes of infants with Thimerosal exposure from vaccines compared with those of unexposed, that is, non-vaccinated infants. Also, studies often cited by CDC as exonerating Thimerosal do not address genetically sensitive populations who may be predisposed to adverse reactions, as noted by the Institutes of Medicine in 2004. Recent toxicological studies indicate that the damage done by toxicants can happen in both high and low-level exposures if genetic differences are present. See UC Davis Studies on *Mercury* and *Lead*. Stamova B, et al. Correlations between gene expression and mercury levels in blood of boys with and without autism. Neurotox Res. 24 November 2009// Jan 2011;19 (1):31-48. doi: 10.1007/s12640-009-9137-7. https://pmc.ncbi.nlm.nih.gov/articles/PMC3006666/

Tian Y, et al. Correlations of gene expression with blood lead levels in children with autism compared to typically developing controls. Neurotox Res. 2011 Jan;19(1):1-13. https://pmc.ncbi.nlm.nih.gov/articles/PMC3006638/

CDC continues its social marketing explanation of this epidemic as a result of better diagnosis to defend their lack of urgency in addressing this national health catastrophe. SafeMinds concludes, along with many other medical and scientific experts, that the epidemic is environmentally based, thereby requiring urgent action. These children have been diagnosed since 2004 or before. It is astounding that CDC is so many years behind in tracking autism prevalence; a delay that would never occur for an infectious disease like influenza or measles.

Further, the timing of its release on the Friday before Christmas raises many questions with regard to CDC's political motives. Jim Moody, legal counsel for SafeMinds, stated, "CDC is trying to cover up its failure to respond with the urgency required by the epidemic in the face of mounting evidence that autism is environmentally-induced, and that the environment, according to the US Court of Claims – the Vaccine Court - includes vaccines. CDC's game plan is to maintain that actual prevalence has been constant over time and the reported cases are simply the result of better awareness. That 'defense' is a blatant lie as it would mean that doctors, specialists, and educational professionals somehow missed 95% of the cases 20 years ago when autism was purported to be 1 in 2500. CDC's 'better awareness' defense simply cannot be taken seriously and looks more and more absurd with each new release of prevalence data."

SafeMinds asks journalists to consider the following and to seek answers from the CDC, Health and Human Services (HHS), Food and Drug Administration (FDA), and National Institutes of Health (NIH) Interagency Autism Coordinating Committee (IACC), chaired by Dr. Tom Insel:

1. UC Davis M.I.N.D. Institute study finds that the majority of autism cases must be environmentally triggered. What changed in the environment from 1994 to 1996 which would cause 50% more healthy toddlers, who are reaching all developmental milestones on time, to suddenly regress into autism and exhibit signs of toxicity and environmental illness?
2. Will the Interagency Autism Coordinating Committee (IACC) respond and immediately add a research objective to the Strategic Plan for Autism Research for a time trend analysis of autism rates to determine what changed in the environment to reveal possible autism triggers?
3. *What environmental trigger affects children* at approximately the same time in their lives – regardless of race and ethnicity, from big cities to small, rural to urban, those with siblings and those without, those with rich parents, poor parents and every socio-economic category in between? *Might it be vaccines*?
4. What environmental toxin is still rapidly accumulating worldwide and has been known to cause developmental problems? Might it be mercury from coal plant emissions and other manmade sources?
5. When will the CDC do a transparent study, overseen by outside sources, to compare the health outcomes of children who received Thimerosal containing vaccines to those who did not? This study

has never been done and until this study and studies addressing genetically sensitive populations is conducted, *Thimerosal remains a viable causal factor in vaccine injury*.

6. How has a safe level of mercury in Thimerosal been determined in the absence of research? Yet children received up to 237.5 mcgs. of Thimerosal in the 90's via vaccines, and continue to receive mercury in vaccines today both in trace amounts and amounts exceeding the Federal safety guideline from the seasonal and H1N1 influenza vaccines. The recent recall of almost 1 million H1N1 Thimerosal-free doses has left the nation without an adequate supply of mercury-free H1N1 vaccines for babies.

7. Why does the CDC still allow even trace amounts of mercury in vaccines given that the trace is coupled with other toxic ingredients like aluminum, phenol, formaldehyde and other carcinogens?

8. Why do the CDC and the IACC refuse to do a study of all health outcomes of fully vaccinated vs. unvaccinated children despite years of parents requesting the study? Will they now conduct a vaccinated/unvaccinated study identified in June as a vaccine safety gap by the National Vaccine Advisory Committee (NVAC) ?

9. Last Friday the Institute of Medicine (IOM) stated that the United States needs to establish a permanent group that advises the government on vaccine safety and substantially increase research monies to improve vaccine safety and address public concern. What action will be taken on this recommendation?

10. Which patents does the CDC hold on childhood vaccines and how much money do they receive from vaccines given to children? An investigative report done by UPI in 2003 found that the CDC owned 28 patents.

11. The CDC is responsible for the recommended vaccine schedule and owns many patents on vaccines. They are also in charge of marketing vaccines and managing vaccine safety. This is a glaring conflict of interest analogous to the fox guarding the hen house. When will oversight of vaccine safety be removed from the CDC and placed in the hand of an independent agency?

12. *When are the CDC and NIH going to recognize that autism is an epidemic and provide the much needed research into environmental triggers it deserves*?

13. Ask Dr. Tom Insel, Chair of the IACC, why for the second year in a row, toxicological expertise remains virtually absent on science panels convened to update the Strategic Plan for Autism Research. Why has the IACC only approved research on five environmental factors, when so many more potential candidates were identified by an Institute of Medicine Workshop on Autism and the Environment? Why did he tell Congress additional research money was not needed for autism, when research on environmental factors has always been underfunded by NIH?

During the past 20 years *American children have been the sickest on record,* with chronic illnesses like autism, cancer, rheumatoid arthritis, diabetes, asthma, allergies, obesity, heart problems and behavioral disorders like ADHD, OCD, bi-polar disorder and more. The increase in these diseases came at a time when mercury and other toxins in vaccines tripled, the number of vaccines given to children went from roughly 18 shots to 36 shots currently, and mercury has continued to accumulate in the air, water, soil, and food.

Individuals with autism continue to suffer due to inadequate scientific research on environmental factors. SafeMinds calls upon the U.S. public health system to treat autism as the national crisis it is and to take urgent action to find the causes of and treatments for autism. Families cannot wait another two years for autism to rise to 1 in 50 kids.

SafeMinds is a charitable non-profit and leader in funding and advancing the science regarding mercury exposure as it relates to autism. Our expertise extends beyond mercury-related exposures to broader vaccine safety issues, as many of our Board Members hold government agency committee positions such as the Interagency Autism Coordinating Committee, various CDC Vaccine Committees, the Department of Defense Autism Spectrum Disorder Research Program and the National Vaccine Advisory Committee's Vaccine Safety Working Group.

Roman Bystrianyk

Thimerosal: A vaccine ingredient's toxic legacy

Health Sentinel, 30 December 2009, 02:28
https://web.archive.org/web/20100122044808/http://www.healthsentinel.com/joomla/index.php?option=com_content&view=article&id=2663:thimerosal-a-vaccine-ingredients-toxic-legacy&catid=5:original&Itemid=24

April, 1948 an article is published in the journal Pediatrics: [Randolph K. et al. Encephalopathies following prophylactic Pertussis Vaccine. – Pediatrics, 1948, April 1, 1 (4): 437–457].

"Inspection of the records of the Children's Hospital for the past ten years has disclosed 15 instances in which children developed acute cerebral symptoms within a period of hours after the administration of pertussis vaccine. The children varied between 5 and 18 months in age and, in so far as it is possible to judge children of this age range, were developing normally according to histories supplied by their parents. None had convulsions previously."

"Twelve of the children were boys and three were girls, a sex difference also encountered in relation to other substances, such as lead, causing gross injury to the developing nervous system. At inoculation time, the children varied in age between 5 and 18 months. Developmental data were obtained in detail on all but two of the children, whose mothers simply stated that they had developed normally. Reference to the case histories showed that such objective activities such as sitting, walking, and talking had appeared in many of the children prior to the inoculations; and the regressions or failure of further development occurred after the encephalopathies [Any disease or symptoms of disease referable to disorders of the brain] in several instances. In so far as it was possible to judge none of the children were defective prior to their acute illness."

"In common with many other biologic materials used parenterally [not by mouth], an important risk of encephalopathy attends the use of prophylactic pertussis vaccine. The mechanism whereby the encephalopathy is produced is not elucidated by the present study. The universal use of such vaccine is warranted only if it can be shown to be effective in preventing encephalopathy or death from pertussis itself in large groups of children. If avoidance of the inconvenience of the average attack of pertussis is all that is expected, the risk seems considerable. Efforts to diminish the hazard by modification of the vaccine or new methods of administration seem indicated."

Fast forward 60 years to the present; parents state their children were developing normally until the time of a vaccine; boys are 3 to 4 times more likely to have autism than girls; often times sitting, walking, talking are all normal in a child until 12-30 months followed by a major regression. The parallels to the present day epidemic in childhood neurologic disorders to this 1948 article are striking and concerning. What is equally disturbing is the observation of the authors that the neurologic problem occurred near the administration of the pertussis vaccine and that the "sex difference" in the "gross injury to the developing nervous system" was similar to the heavy metal lead.

Coal-burning power plants, use of mercury in gold mining, industrial manufacturing, incineration of municipal and medical waste, are some of the sources of heavy metals found in our modern

environment. These pollutants contaminate our environment and enter our food supply and eventually our bodies. In some cases heavy metals were added to products, such as in mercury amalgam fillings, and one substance in particular, Thimerosal, has been believed by many to be a major cause of neurologic problems that we encounter today.

Thimerosal is a mercury-containing organic compound or organomercurial. In the 1930s, Eli Lily developed Thimerosal as a preservative and it has been used in a number of biological and drug products, including many vaccines. Until the removal of Thimerosal, which contains 49.9% ethyl mercury by weight, from most pediatric vaccines in 2001, the source of the largest human exposure to mercury in the US was in children under 18 months of age undergoing routine childhood immunization schedules. Before 2001, a child may have received a cumulative dose of over 200 µg/kg [micrograms per kilogram] in the first 18 months of life.

Although Thimerosal has been removed from most childhood vaccines, it is still present in the flu vaccine, which is given to pregnant women, the elderly, and children. Also, many vaccines given to children in developing countries still contain Thimerosal.

Many still believe that Thimerosal is safe and effective and that there is little to no evidence that there is any health problems associated with this substance. ***According to the FDA website***:

"Thimerosal has been the subject of several studies and has a long record of safe and effective use preventing bacterial and fungal contamination of vaccines, with no ill effects established other than minor local reactions at the site of injection."

The article references eight studies supporting their position. But is there evidence that shows Thimerosal isn't safe?

A Material Safety Data Sheet or MSDS is a document that provides the proper procedures for handling or working with a particular substance. The information includes physical data (such as melting point, boiling point, etc.), toxicity, health effects, first aid, reactivity, storage, disposal, protective equipment, and spill/leak procedures.

The hazard rating information that appears on the MSDS is summarized on a diamond-shaped diagram that can rapidly alert personnel to substances that require special caution. Hazards are rated from 0 indicating no unusual hazard to 4 a severe hazard. The blue area of the diamond relates to health and a rating of 2 in the case of Thimerosal indicates "Intense or continued exposure could cause temporary incapacitation or possible residual injury unless prompt medical attention is given."

Here are some disturbing excerpts from the ***MSDS for thimerosal*** (trade name Merthiolate):

"Section 3: Hazards Identification - Potential Chronic Health Effects: The substance may be toxic to *kidneys, liver, spleen, bone marrow, central nervous system* (CNS). Repeated or prolonged exposure to the substance can produce target organs damage. Repeated exposure to a highly toxic material may produce general deterioration of health by an accumulation in one or many human organs."

"Section 6: Accidental Release Measures - Poisonous solid. Stop leak if without risk. Do not get water inside container. Do not touch spilled material. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed."

"Section 11: Toxicological Information - Chronic Effects on Humans: *Mutagenic Effects*: Mutagenic for mammalian somatic cells. May cause damage to the following organs: kidneys, liver, spleen, bone marrow, central nervous system (CNS). Special Remarks on Chronic Effects on Humans: May cause cancer based on animal data. No human data found."

"Inhalation and Ingestion: Repeated or prolonged exposure may cause kidney damage, and may affect the liver, and bone marrow. Chronic exposure to mercury vapors behavior/central nervous system and peripheral nervous system (*depression, irritability, nervousness, weakness, ataxia, fatigue,*

tremor, jerky gait, limb spasms, personality changes), metabolism (*anorexia, weight loss*) and cause gastrointestinal disturbances which is collectively referred to as "*aesthenic-vegetative syndrome*." Chronic ingestion may cause accumulation of mercury in body tissues and may result in salicylism which is characterized by *nausea, vomiting, gastric ulcers, and hemorrhagic strokes*."

In addition Elli Lilly's ***1999 MSDS*** contains more disturbing information:

"Section 3: Hazards Identification - ... Exposure to mercury in utero and in children *may cause mild to severe mental retardation and mild to severe motor coordination impairment*."

"Section 6: Accidental Release Measures - Wear protective equipment, including eye protection, to avoid exposure. This material is a mercury compound which are CERCL Hazardous Substances and SARA 313 Toxic Chemicals."

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as Superfund, was enacted by Congress on December 11, 1980. This law created a tax on the chemical and petroleum industries and provided broad Federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. SARA 313 requires the EPA and State Regulatory Agencies to annually collect data on releases and transfers of certain toxic chemicals from industrial facilities, and make the data available to the public through a public database called the Toxics Release Inventory, or TRI.

These data safety sheets alone are certainly a cause for concern. One has to question why would anyone use such a dangerous substance in any medical product let alone one that is injected directly into the blood stream? But in addition to the MSDS there are numerous studies from the medical and scientific literature that clearly show thimerosal is not a safe substance.

The following are a few excerpts from a number of scientific journals:

1977: D. G. Fagan, J. S. Pritchard, T. W. Clarkson, And M. R. Greenwood.*Organ mercury levels in infants* with omphaloceles treated with organic mercurial antiseptic. – Archives of Disease in Childhood, 1977, 52, 962-964; doi: 10.1136/adc.52.12.962. https://pubmed.ncbi.nlm.nih.gov/606172/

Summary: Samples of fresh and fixed tissues from infants with exomphalos treated by thiomersal application were analysed for mercury content. The results showed that thiomersal can induce blood and organ levels of organic mercury which are well in excess of the minimum toxic level in adults and fetuses. The analysis of fresh and fixed tissues must be carefully controlled against normal tissues in order to interpret mercury levels accurately.

"Although thiomersal [thimerosal] is an ethyl mercury compound, it has similar toxicological properties to methyl mercury and in long-term neurological sequelae [a pathological condition resulting from a disease, injury, or other trauma] produced by the ingestion of either methyl or ethyl mercury-based fungicides and indistinguishable ... Since it is clear that treatment of exomphalos [an umbilical hernia at birth in which some abdominal organs push into the umbilical cord] by the application of alcoholic mercurial antiseptics can produce blood and tissue levels of mercury well above the threshold at which damage occurs in all other age groups, it is extremely unlikely that these infants escape neurological damage, which may be subtle. We therefore suggest that treated survivors should be examined neurologically and psychologically as a matter of urgency. Organic mercurial antiseptics should be heavily restricted or withdrawn from hospital use, as the fact that mercury readily permeates intact membranes and is highly toxic seems to have been forgotten. Equally effective and far less toxic broad-spectrum antifungal and antibacterial topical antiseptics are currently available."

2003: Baskin DS, Ngo H, Didenko VV. *Thimerosal induces DNA breaks*, caspase-3 activation, membrane damage, and cell death in cultured human neurons and fibroblasts. Toxicological Sciences. 2003 Aug;74(2):361-8. doi: 10.1093/toxsci/kfg126. https://pmc.ncbi.nlm.nih.gov/articles/PMC1892749/

"In clinical cases of accidental or intentional usage in high concentrations, thimerosal was administered in doses from 3 mg/kg to several hundred mg/kg. Such doses resulted in local necrosis [The death of living cells or tissues] at the application site and severe central nervous system and kidney injury ... In this paper we demonstrated that extending the time of incubation with thimerosal from 2 to 6 hours is associated with toxicity that was not seen after a shorter time of exposure. For this reason, further studies of lower concentrations and longer exposure times appear to be warranted. These results indicate that additional research is needed to fully delineate the dose- and time-dependent toxicity of thimerosal in sub-micro-molar concentrations and suggests that toxicity may occur at even lower doses than those utilized in these experiments, with longer times of exposure. Because mercury can be retained in body organs for months to years, the study of longer incubation times is warranted."

2003: Westphal GA, Asgari S, Schulz TG, Bünger J, Müller M, Hallier E. *Thimerosal induces micronuclei* in the cytochalasin B block micronucleus test with *human lymphocyte*s. Arch Toxicol. 2003 Jan;77(1):50-5. doi: 10.1007/s00204-002-0405-z. https://pubmed.ncbi.nlm.nih.gov/12491041/

"Thimerosal is a widely used preservative in health care products, especially in vaccines. Due to possible adverse health effects, investigations on its metabolism and toxicity are urgently needed. An in vivo study on chronic toxicity of thimerosal in rats was inconclusive and reports on genotoxic effects in various in vitro systems were contradictory. Therefore, we reinvestigated thimerosal in the cytochalasin B block micronucleus test. Glutathione S-transferases were proposed to be involved in the detoxification of thimerosal or its decomposition products. Since the outcome of genotoxicity studies can be dependent on the metabolic competence of the cells used, we were additionally interested whether polymorphisms of glutathione S-transferases (GSTM1, GSTT1, or GSTP1) may influence the results of the micronucleus test with primary human lymphocytes. Blood samples of six healthy donors of different glutathione S-transferase genotypes were included in the study. At least two independent experiments were performed for each blood donor. Significant induction of micronuclei was seen at concentrations between 0.05-0.5 micro g/ml in 14 out of 16 experiments. Thus, genotoxic effects were seen even at concentrations which can occur at the injection site. Toxicity and toxicity-related elevation of micronuclei was seen at and above 0.6 micro g/ml thimerosal. Marked individual and intraindividual variations in the in vitro response to thimerosal among the different blood donors occurred. However, there was no association observed with any of the glutathione S-transferase polymorphism investigated. In conclusion, thimerosal is genotoxic in the cytochalasin B block micronucleus test with human lymphocytes. These data raise some concern on the widespread use of thimerosal."

"In conclusion, thimerosal induced strong effects in the cytochalasin B in vitro [outside the living organism] micronucleus test in human lymphocytes ... Since thimerosal was repeatedly shown to be genotoxic [damaging to DNA] in vitro and in vivo [inside the living organism], there is reason for concern about its widespread use."

2004: Toxicology [the source is unknown]

"Both thimerosal and methylmercury increased the [Ca2+]i and oxidative stress in cerebellar granule cells. In rat cerebellar granule neurons, the increase in [Ca2+]i induces an increase in oxidative stress while the oxidative stress increases the [Ca2+]i. It is a possibility that uncontrolled and sustained elevation of [Ca2+]I increases the formation of reactive oxygen species that induce a further increase in [Ca2+]i. *If so, such insults induced by thimerosal and methylmercury would lead to cell injury or death in brain neurons* ... In can be concluded that the potency of thimerosal to induce cytotoxic [substances that are toxic to cells] action on brain neurons dissociated from 2-week-old rats under the in vitro conditions is similar to that of methylmercury."

2005: James SJ, Slikker W 3rd, Melnyk S, New E, Pogribna M, Jernigan S. *Thimerosal neurotoxicity is associated with glutathione depletion*: protection with glutathione precursors. Neurotoxicology. 2005 Jan;26(1):1-8. doi: 10.1016/j.neuro.2004.07.012. https://pubmed.ncbi.nlm.nih.gov/15527868/

"In both cell lines, a progressive increase in cytotoxicity [decrease in viability] was observed when Thimerosal dose was progressively doubled from 2.5 µmol/L [micromoles per liter] to 5, 10, and 20 µmol/L. Viability was reduced more than 50% in both cell lines with exposure to 10 µmol/L Thimerosal and less than 10% of cells survived a dose of 20 µmol/L. *Thimerosal induces oxidative stress and apoptosis [programmed cell death] by activating mitochondrial cell death pathways*. A subsequent study using cultured human neuron and fibroblast cell lines similarly showed that low micromolar concentrations of Thimerosal induced DNA strand breaks, caspase-3 activation, membrane damage and cell death."

2007: Geier DA, et al. A review of Thimerosal (Merthiolate) and its ethylmercury breakdown product: specific historical considerations regarding safety and effectiveness. J Toxicol Environ Health B Crit Rev. 2007 Dec;10(8):575-96. https://pubmed.ncbi.nlm.nih.gov/18049924/

"The high order of toxicity from Thimerosal and its ethylmercury breakdown product has been known and published for decades. Nonetheless, Thimerosal remains in the drug supply, especially in various vaccines manufactured both for the United States and globally. The ubiquitous and largely unchecked place of Thimerosal in pharmaceutical products, therefore, represents a medical crisis in the modern day. Reforms in the manufacture and the licensing of vaccines and other drugs, which should have been accomplished proactively, had anyone properly assessed their mercury content, must now be conducted, reactively, under significant systemic stress. *With no warning, recall, or ban of mercury in vaccines and other drugs as of yet, the victim of this mandated, unwarranted, and massive mercury exposure is still an unsuspecting public, and most especially its unborn and newborn children*."

2007 - Anales de la Facultad de Medicina [the exact article is unknown]

"Due to the vast gaps in knowledge of thimerosal's pharmacokinetics and pharmacodynamics, as its toxic properties over the immune system, it is required to make more studies of quantitative character in animal models as soon as possible. Nevertheless, while it is true, it is difficult to extrapolate these findings to other animal experimentation groups and over human beings, our results, as the multiple scientific evidence recently published about thimerosal, clearly indicates the toxic nature of this substance, at the same dose and the same chronology as human immunizations; therefore we suggest the employment of alternative preservatives in vaccines, especially those intended to pregnant women, neonates, and small children based in the prevention and precaution principles of all medical interventions."

2008: David A. Geier, et al. Neurodevelopmental Disorders, Maternal Rh-Negativity, and Rho(D) Immune Globulins: A Multi-Center Assessment. – Neuroendocrinology Letters, 2008, April, V 29 N 2: -272-280. https://pubmed.ncbi.nlm.nih.gov/18404135/

Background: Many formulations of Thimerosal (49.55% mercury by weight)-containing Rho(D) immune globulins (TCRs) were routinely administered to Rh-negative mothers in the US prior to 2002.

Objectives: It was hypothesized: (1) if prenatal Rho(D)-immune globulin preparation exposure was a risk factor for neurodevelopmental disorders (NDs) then more children with NDs would have Rh-negative mothers compared to controls; and (2) if Thimerosal in the Rho(D)-immune globulin preparations was the ingredient associated with NDs, following the removal of Thimerosal from all manufactured Rho(D)-immune globulin preparations from 2002 in the US the frequency of maternal Rh-negativity among children with NDs should be similar to control populations.

Methods: Maternal Rh-negativity was assessed at two sites (Clinic A-Lynchburg, VA; Clinic B-Rockville and Baltimore, MD) among 298 Caucasian children with NDs and known Rh-status. As

controls, maternal Rh-negativity frequency was determined from 124 Caucasian children (born 1987-2001) without NDs at Clinic A, and the Rh-negativity frequency was determined from 1,021 Caucasian pregnant mothers that presented for prenatal genetic care at Clinic B (1980-1989). Additionally, 22 Caucasian patients with NDs born from 2002 onwards (Clinics A and B) were assessed for maternal Rh-negativity.

Results: There were significant and comparable increases in maternal Rh-negativity among children with NDs (Clinic: A=24.2%), autism spectrum disorders (Clinic: A=28.3%, B=25.3%), and attention-deficit-disorder/attention-deficit-hyperactivity-disorder (Clinic: A=26.3%) observed at both clinics in comparison to both control groups (Clinic: A=12.1%, B=13.9%) employed. Children with NDs born post-2001 had a maternal Rh-negativity frequency (13.6%) similar to controls.

Conclusion: This study associates TCR exposure with some NDs in children.

2008: Austin, D. An epidemiological analysis of the 'autism as mercury poisoning' El hypothesis Intern. J. of Risk & Safety in Medicine. 2008, 20 (3): 135-142, DOI: 10.3233/JRS-2008-0436; https://content.iospress.com/journals/international-journal-of-risk-and-safety-in-medicine/20/3

"Biological findings in autism that are consistent with mercury poisoning include elevated oxidative stress, depleted levels of glutathione, neurochemical irregularities, gastro-intestinal distress, immune dysregulation and generalized and neural inflammation. All of these are also well documented effects of mercury poisoning and, specifically, mercury poisoning in infants ...

Autism is a modern disease. It was first identified in the late 1930s and reported in 1943 by Kanner. It is important to place the arrival and subsequent epidemic growth of autism into the historical context of environmental exposure to mercury.

Therefore, it is important to acknowledge that the commencement of widely available vaccinations (containing mercury) commenced in the 1930s. Additionally, the early 1900s saw the increasing availability and popularity of dental care where mercury amalgam fillings were the dominant restorative material ...

The existing scientific literature provides grounds for strong suspicion that mercury plays a causal role in the development of autism. Given this suspicion, and the severe nature, devastating lifelong impact and extremely high prevalence of autism, it would be negligent to continue to expose pregnant and nursing mothers and infant children to any amount of avoidable mercury. Health authorities worldwide should move without hesitation to ban and remove all mercury in all medical products at the earliest possible date."

Abstract: Where direct experimental research into a causal hypothesis of a disease is impossible due to ethical and practical considerations, epidemiological inference is the accepted route to establishing cause. Therefore, to examine the autism as mercury poisoning hypothesis, this paper reviews the existing scientific literature within the context of established epidemiological criteria and finds that the evidence for a causal relationship is compelling. Exposure to mercury (via vaccines and maternal dental amalgam) in utero and during infant years is confirmed; mercury poisoning is known to cause symptoms consistent with autism; animal modeling supports the link and, critically, mercury levels are higher in both the urine and blood of autistic children than in non-autistic peers. Analogous to epidemiological evidence of the smoking–lung cancer relationship, a mercury–autism relationship is confirmed. The precautionary principle demands that health professionals not take an action if there is suspicion that the action may cause severe or lifelong health effects: it does not require certainty. Therefore, given the severity, devastating lifelong impact and extremely high prevalence of autism, it would be negligent to continue to expose pregnant and nursing mothers and infant children to any amount of avoidable mercury.

2009: Dufault R., Schnoll R., Lukiw W.J. *et al.* Mercury exposure, nutritional deficiencies and metabolic disruptions may affect learning in children. *Behav Brain Funct* 2009, October 27, 5, 44; https://doi.org/10.1186/1744-9081-5-44

https://behavioralandbrainfunctions.biomedcentral.com/articles/10.1186/1744-9081-5-44#citeas

Among dietary factors, learning and behavior are influenced not only by nutrients, but also by exposure to toxic food contaminants such as *mercury* that can disrupt metabolic processes and alter neuronal plasticity.

Neurons lacking in plasticity are a factor in neurodevelopmental disorders such as *autism and mental retardation*.

Essential nutrients help maintain normal neuronal plasticity. Nutritional deficiencies, including deficiencies in the long chain polyunsaturated fatty acids eicosapentaenoic acid and docosahexaenoic acid, the amino acid methionine, and the trace minerals zinc and selenium, have been shown to influence neuronal function and produce defects in neuronal plasticity, as well as impact behavior in children with attention deficit hyperactivity disorder.

Nutritional deficiencies and mercury exposure have been shown to alter neuronal function and increase oxidative stress among children with autism. These dietary factors may be directly related to the development of behavior disorders and learning disabilities. *Mercury, either individually or in concert with other factors*, may be harmful if ingested in above average amounts or by sensitive individuals.

High fructose corn syrup has been shown to contain trace amounts of mercury as a result of some manufacturing processes, and its consumption can also lead to zinc loss. Consumption of certain artificial food color additives has also been shown to lead to zinc deficiency. Dietary *zinc is essential for maintaining the metabolic processes required for mercury elimination*.

Since high fructose corn syrup and artificial food color additives are common ingredients in many foodstuffs, their consumption should be considered in those individuals with nutritional deficits such as zinc deficiency or who are allergic or sensitive to the effects of mercury or unable to effectively metabolize and eliminate it from the body.

"A disruption of the GSH (glutathione) system by mercury leads to GSH depletion and cell destruction. An in vitro study of Jurkat T cells exposed to thimerosal demonstrated concentration-dependent apoptosis. It was found that the mercury moiety [part of the molecule], not the thiosalicylic acid moiety, of thimerosal was responsible for glutathione depletion. GSH depletion is linked to several neurodegenerative disorders."

2009: Hewitson L, Houser LA, Stott C, et al. Delayed Acquisition of Neonatal Reflexes in newborn Primates receiving A Thimerosal-containing HepatitiS B Vaccine: influence of gestational age and Birth weight. – Neurotoxicology, 2009, DOI: doi:10.1016/j.neuro.2009.09.008
https://www.rescuepost.com/files/hewitson-et-al-09-primate-hbv-study.pdf

Our study design does not enable us to determine whether it is the vaccine per se, the exposure to Th [thimerosal], or a combination of both that is causing the observed effects. None-the-less, the developing brain is considered the most vulnerable organ to mercury exposure, and experimental studies suggest that the brainstem - whose function is central to the reflexes described herein - may be one of the more sensitive targets ... Since the acquisition of motor reflexes is controlled by the brainstem, it is possible that very early exposure to ethyl mercury may adversely affect the emerging brainstem function ... this study provides preliminary evidence of abnormal early neurodevelopmental responses in male infant rhesus macaques [type of monkey] receiving a single dose of Th-containing [Thimerosal containing] HB [Hepatitis B] vaccine at birth and indicates that further investigation is merited."

There are still more studies not included in this article simply because the volume of information would be overwhelming, but the Material Data Safety Sheets and these scientific excerpts speak for themselves - Thimerosal is clearly a dangerous substance.

What the authors of that 1948 study probably didn't know when they said "If avoidance of the inconvenience of the average attack of pertussis is all that is expected" was that the historical data shows the death rate from pertussis had already fallen by 99% by the time they were writing their article and that their call to "diminish the hazard" of the vaccine would be apparently largely unheeded.

Age of Autism

Mark Blaxill

From The Roman to The Wakefield Inquisition

Age of Autism, 27 January 2010
https://web.archive.org/web/20100607110836/http://www.ageofautism.com/2010/01/from-the-roman-to-the-wakefield-inquisition.html#http://www.ageofautism.com/2010/01/from

The UK General Medical Council Hearing decision is due Thursday, January 28, at 9:01am EDT. We'll be running posts throughout the week, including this one, which first ran on 12/31/08.

As the year draws to a close, all of us at the Age of Autism are very pleased to honor Dr. Andrew Wakefield. As we've reported here many times during the past year, *Dr. Wakefield has been the subject of a remarkable and unprecedented campaign to discredit his work and character, most notably in a show trial that is still underway in London, in hearings of the General Medical Council*. In the face of extraordinary attempts to silence him, Wakefield has stood up to these attacks with grace and determination and has continued his research and clinical work on behalf of children and families suffering from autism. That makes him our first Age of Autism *Galileo Award* recipient.

Like many of our awards this year, this wasn't a difficult decision. In fact, this may be one of those unusual cases where the recipient of an award in some ways outshines its namesake. To understand why that might be so, you need to understand a bit more about why we chose to name the award after the Italian scientist Galileo, what he represents to the history of science and how his experience compares with Wakefield's.

Galileo Galilei was born in Pisa, Italy in 1564. And while he was a physicist and mathematician of some note, Galileo was as much a practical mechanic as he was a grand theorist; indeed it was his tinkering with convex and concave lenses that gave him the tools to leave his lasting mark on the world. As a skilled inventor of early working telescopes, he did not design the world's first telescope, but he was the first to make them powerful enough for scientific use. In fact, the word telescope (derived from the Greek roots *skopein*, "to see", and *tele* for "far") was coined in 1611 to describe one of Galileo's first instruments. For the accomplishments that flowed from his pioneering work, he has been described by many as The Father of Modern Physics; Albert Einstein even went so far as to name him The Father of Modern Science.

But Galileo is celebrated today not as much for his engineering talent as for the suffering he endured in support of an unpopular scientific theory. Because it was Galileo's work with telescopes in the early 17th century that lent critical support to the theory of *heliocentrism*, the idea that the earth revolved around the sun and not the other way around. As with his telescope technology, Galileo was not the first to propose the heliocentric theory: that distinction belongs to Nicolai Copernicus. Yet Copernicus, a Polish mathematician, was well aware of the personal risk of disseminating his ideas and delayed their publication for many years. Copernicus' major work, *De revolutionibus orbium coelestium*, was published only shortly before his death at age 70 in 1543.

Galileo, by contrast, was an aggressive advocate for the truth as he saw it. He used his telescope to provide clear visual evidence that the sun occupied the center of the solar system. He then published his evidence fearlessly in the prime of his life, starting while in his 40s. And although for a while he obtained the approval of the Vatican to publish some of his work, he was eventually forced to spend most his later life defending himself and his findings. For as the significance of his observations for the

prevailing Catholic orthodoxy became increasingly clear, Galileo was derided as a heretic, denounced publicly and finally given an ultimatum: renounce your theory or else. In 1633, he was put on trial by the "Supreme Sacred Congregation of the Universal Inquisition", known today as the *Roman Inquisition*, and convicted of heresy. Barely escaping prison, Galileo spent the rest of his life under house arrest, where he died nearly ten years later.

The many parallels between the Roman Inquisition and the Wakefield Inquisition are uncanny. Like Galileo, *Wakefield came to autism both as a practical man and a scientist*; his initial involvement in autism was simply in response to a group of parents who approached him as a specialist in pediatric gastroenterology. They told him, "*Our children are not defective, they are sick*" and Wakefield listened. Also like Galileo, Wakefield didn't originate the idea that vaccines might play a role in autism, but has become the most prominent developer of the idea. As Galileo's telescopes allowed him to discover the moons of Jupiter, so did Wakefield's use of new ways of seeing, in this case an endoscope to see into a child's intestines, allow him to discover a distinctive gut pathology in autism. He named what he saw *autistic enterocolitis*, and it was a finding that quite literally turned the brain-centric view of autism upside down. But this was no ordinary finding, for Wakefield's specific challenge to the orthodox view of autism science made him a target for the medical establishment. He published his first major work in the prestigious journal *The Lancet*, where the editor Richard Horton had full awareness of its controversial potential. But when the controversy turned too hot to handle, Horton lost his nerve and in a perfidious betrayal that history should remember (see John Stone's wonderful essay on Horton (HERE), Horton turned on Wakefield. https://web.archive.org/web/20100414083541/http://www.ageofautism.com/2008/12/smoke-and-mirrors-dr-richard-horton-and-the-wakefield-affair.html

Thanks to Horton's perfidy, and again like Galileo, Wakefield now finds himself on trial for his license to practice medicine in front of the General Medical Council (GMC). And although the GMC might defend the validity of its allegations, it is plain to all who have followed the case closely that the trumped up charges hold little merit. Still, the outcome of the proceedings lies in considerable doubt, for Wakefield has not been subjected to these months of review on the basis of any *actual* medical misconduct (not surprisingly, no parent with whom he worked supports the GMC's case). Quite clearly, and again like Galileo in the face of the Roman Inquisition, the offense for which Wakefield is really on trial is *heresy*. And whenever an Inquisition has begun to confront the conflicts between religious orthodoxy and inconvenient evidence, one can never predict how the High Inquisitors will render their judgment. The only thing we can predict is that a process like the Wakefield Inquisition is always more concerned with appearances than justice.

Wakefield's heresy comes at a particularly difficult time for the medical profession that has placed him on trial. The twin pillars of its quest for the causes of human disease, germs and genes, have failed for years to explain the scourge of *chronic disease*: a scourge that has replaced infectious disease as the main public health problem of the developed world. In the face of a simmering disquiet over what has become an increasingly embarrassing scientific failure, it has become ever more important to the profession's high priests to distract attention from the crumbling bulwarks of their belief system and take action to defend the tools and targets of those pillars: the germ theory of disease that was medicine's greatest contribution to human civilization and provided its two principle tools, vaccines and antibiotics; and the genetic model of human disease that has been medicine's great hope to succeed germ theory and the precious disease targets such as autism that it hopes to explain. Seen in this context, Wakefield's heresies have been unusually threatening because they operate on both fronts: they compete with the genetic explanations of autism with a causal model that threatens to tarnish the heroic triumphs of germ theory.

So like Galileo's compelling work in support of heliocentrism, Wakefield's dual challenge to vaccine development and autism science has evoked a strong response from the highest levels of authority. In Wakefield's case, his prosecutors have determined not only that he must be shown to be wrong, he must also be punished. That means his work on autism (as well as others doing supportive work) must be stopped while he must also be stripped of his credentials as a member of the medical profession. The modern punishment for heresy may not include death, but it can be exile and excommunication.

Casting the treatment of Wakefield as a religious response is the only way to make sense of the behavior of the medical establishment over the last several years. If it were not so serious, its escalating absurdity would begin to resemble farce. One example is the latest defense of the ever-expanding childhood immunization program. Instead of embracing the importance of improving vaccine safety, the program's defenders have now declared that the temple of the sacred program must never be defiled, and certainly must not be subjected to conventional safety research. So the obvious research project of comparing the total health outcomes in vaccinated vs. unvaccinated individuals has been rejected not merely as too expensive, now it simply must not be done. In the Orwellian logic of the CDC, such studies in humans would be "prospectively unethical" and "retrospectively impossible."

Let's be frank here. This is an epistemological obscenity: It's not just that we don't know some very basic things about the safety of the sacred program, *we also cannot know and should not seek to know*. This stance should offend even the most skeptical scientists. Still, the farce continues.

In the meantime, there remains a body of published evidence that must be dealt with. And for this, since the retraction of every published study is well-nigh impossible (some of Wakefield's less courageous co-authors famously "*retracted the interpretation" of the Lancet paper*, but they couldn't retract the evidence) there is only one answer left. Nullify the source of the heresy itself. Practically speaking, when establishment voices can no longer claim the absence of causal evidence, the fallback position must be that there is "no credible evidence" linking vaccines and autism. Removing credibility from the evidence requires that the high priests get personal: they must mount a systematic attack on the personal reputations and integrity of scientists who pursue and publish heretical lines of investigation.

And this is why, decades after Stalin and Mao, we now have the travesty of a 21st century show trial in London, the Wakefield Inquisition. It's also why the passionate call on a U.K. parents' web-site, *Cry Shame*, is so deeply correct.

I wouldn't in any way diminish the importance of Galileo, but in an interesting way, Wakefield's steadfastness in the face of adversity outshines the man in whose name we honor him. For, although Galileo finally agreed to recant his support for heliocentrism, Wakefield has never buckled under the pressure. Instead he has stuck to his guns and continued to fight for families with autism. Supported by private funding, his research work has continued (stay tuned for some more blockbuster results next year). And along with the terrific medical team at Thoughtful House, courageous doctors like Arthur Krigsman, Bryan Jepson and Doreen Granpeesheh, he also continues his clinical practice.

In the meantime, the heresy trial staggers onward towards its uncertain conclusion; the GMC's verdict may well come shortly in the New Year. But our judgment at the Age of Autism is clear. Andy Wakefield represents the very best of the scientific tradition. He has persevered in the face of obstacles that would have stopped lesser men in their tracks. He has published continuously and fearlessly. He has pushed important research projects forward despite countless attempts to declare the work irrelevant, the issues "settled." He has dealt with opposing evidence with the professional spirit of a scientist while also following the advice of Karl Popper that "he who gives up his theory too easily in the face of apparent refutations will never discover the possibilities inherent in his theory." Along the way, he has unfailingly represented the issues in autism and the best principles of the scientific method with dignity and restraint. Most important of all, he has refused to be intimidated.

For all this and more, we would like to honor Dr. Andrew Wakefield with our first Galileo Award. And like so many others in our community, I feel proud to call him my friend. Let's be sure to stand behind him in the uncertain times ahead.

Age of Autism

A Short form FAQ About the Wakefield GMC Case

Age of Autism, 28 January 2010
https://web.archive.org/web/20100514140343/http://www.ageofautism.com/2010/01/a-short-form-faq-about-the-wakefield-gmc-case.html#http://www.ageofautism.com/2010/01/a-sh

Below is a short form FAQ about the GMC case of Dr. Andrew Wakefield and colleagues Professor John Walker-Smith and Professor Simon Murch

Did the Ethics Practices Committee of the Royal Free Hospital NHS approve Dr. Wakefield and colleagues' proposal for research biopsies to be conducted on children which ultimately resulted in publication by the Lancet?

YES . The Ethical Practices Committee of the Royal Free Hospital NHS Trust approved proposal # 162-95 before any biopsies were collected for the case study on the Lancet 12.

Was the 1998 Lancet article based on a research study or a case study?

The Lancet article was based on a case study. Case studies do not have control groups.

Did the 1998 Lancet case report say that the MMR vaccine causes autism?

NO. The Lancet case report reads, "We did not prove an association between measles, mumps, and rubella vaccine and the syndrome (autistic enterocolitis) described." The Lancet case report ends with a call for additional research. "We have identified a chronic enterocolitis in children that may be related to neuropsychiatric dysfunction. In most cases, onset of symptoms was after measles, mumps, and rubella immunisation. Further investigations are needed to examine this syndrome and its possible relation to this vaccine."

If the Lancet case report did not say MMR vaccine causes autism, what did some of the co-authors partially retract in 2004?

Nothing. Some of the original co-authors partially retracted an interpretation despite the fact that it never existed in the case report.

The co-author's partial retraction reads, "We wish to make it clear that in this paper no causal link was established between MMR vaccine and autism as the data were insufficient. However, the possibility of such a link was raised and consequent events have had major implications for public health. In view of this, we consider now is the appropriate time that we should together formally retract the interpretation placed upon these findings in the paper, according to precedent."

Again, the original case report itself never interpreted the data as establishing a causal link between MMR and autism, so there was no "causal" interpretation to retract.

If the Lancet case report did not say MMR causes autism, and if his collection of biopsies for research purposes was pre-approved by the Ethical Practices Committee, why is there a case against Dr. Wakefield (and colleagues)?

Medical authorities in the UK (and the United States) do not like it when licensed medical professionals ask questions about vaccine safety. Licensed medical professionals and medical researchers who question vaccine safety are more difficult to dismiss than parents who notice adverse reactions after vaccination.

The prosecution of Dr. Wakefield, Professor Walker-Smith and Professor Murch is an example and warning to other licensed medical professionals and researchers. The warning is clear: if you question the safety of a vaccine, you put your license and career at risk.

Does industry have anything to gain by prosecuting Dr. Wakefield, Professor Walker-Smith and Professor Murch?

Yes, possibly. Industry may use the prosecution of Dr. Wakefield and colleagues in an effort to argue that the MMR vaccine is safe. Merck manufactures both MMR vaccine and Proquad vaccine. In 2009, Merck eliminated the option of single dose Measles, Mumps and Rubella vaccines when they announced they are discontinuing the manufacture of those monovalent vaccines. Now that the single dose option is no longer available, Merck's would benefit if the public perceived MMR's 3-live-viruses-in-1-shot as a safe option for customers wary of Merck's new 4-live-viruses-in-1-shot Proquad.

Additionally, in internal emails regarding Vioxx in Australia, Merck employees discuss "destroying" doctors critical of their products "where they live". MMR is a Merck product. Dr. Wakefield, Professor Walker-Smith and Professor Murch all lived in the UK at the time this study was conducted.

Age of Autism

Generation Rescue Supports Dr. Andrew Wakefield

Generation Rescue, 28 January 2010
https://www.ageofautism.com/2010/01/generation-rescue-supports-dr-andrew-wakefield.html#more

A Statement from Generation Rescue in Support of Dr. Andrew Wakefield.

Do you think pharmaceutical companies have too much influence in the laws, policies, and regulations of our government? We do.

Do you think pharmaceutical companies do things that most Americans would view as unethical to protect their profits? We do.

In a court case in Australia involving the use of the drug Vioxx, it was proven that Merck (the manufacturer of Vioxx) “made a hit list of doctors who had to be "neutralised" or discredited because they criticised the anti-arthritis drug the pharmaceutical giant produced."

In fact, a Merck employee wrote in an email concerning these doctors: "We may need to seek them out and destroy them where they live."

This isn’t the stuff of conspiracy theories, this isn’t the stuff of cynics or crazy parents, this is court-documented behavior of Merck, one of the largest pharmaceutical companies in the world who happens to also be the manufacturer of one of the world’s most profitable vaccines, the MMR (measles-mumps-rubella).

The recent decision by the General Medical Council of the United Kingdom against Andy Wakefield shouldn’t surprise anyone who understands the stakes, profits, and reputations at risk in the debate over vaccines and autism.

The sole purpose of the GMC’s ruling this week is to try and quell the growing concern of parents that the expanding vaccine schedule and the remarkable rise in autism are correlated. The GMC will no doubt be helped by a press that barely understands the debate and has never read any of the dozens of studies published by Dr. Wakefield in many different respected medical journals.

Dr. Wakefield’s journey began with twelve children with autism. Like many of our kids, all twelve of them regressed into autism, and eight of the parents blamed their child’s regression on the MMR vaccine, just as tens of thousands of other parents do.

Having heard the stories of thousands of other parents, we can’t tell you how many times we’ve heard the same exact story about regression after MMR.

Dr. Wakefield, a highly respected gastroenterologist in the UK, was presented with the cases of these twelve children who had all regressed into autism and were all experiencing severe gut pain. He felt it was his duty to investigate the concerns of these parents and figure out what had happened to their children. In this interview with CBS News (please watch it), Dr. Wakefield recounts:

“The conclusion was that there is a bowel disease in children with autism which is new which has not been investigated before, that this may well be related to the developmental regression since they

occurred around the same time and that the parental association with MMR exposure needed to be thoroughly investigated."

Dr. Wakefield's study, which we hope all journalists will take the time to read, was published in February 1998, twelve years ago. Nowhere in the study does Dr. Wakefield tell parents not to vaccinate their children, despite rampant misreporting on this topic.

It has taken twelve long years for the medical community to catch up with Dr. Wakefield's findings. Finally, just last month, in the American Academy of Pediatrics journal, Pediatrics, a landmark consensus report was published with the finding that:

"Gastrointestinal disorders and associated symptoms are commonly reported in individuals with ASDs [autism]."

Thanks, AAP, we've known that for more than a decade thanks to Dr. Wakefield!

This month, a study published in Autism Insights became public and went one step further: it replicated the findings of Dr. Wakefield's paper from twelve years ago, finding once again that the majority of children with autism studied, in this case 143 children, suffered from severe bowel disease -- read the full study by Dr. Arthur Krigsman et al. HERE.

You will hear that Dr. Wakefield's other study authors retracted their findings (they didn't).

You will hear that this ruling somehow implies the MMR is safe for all children (it doesn't). You will hear that this ruling somehow means that vaccines and autism are unrelated (again, it doesn't).

What we think the GMC and pharmaceutical companies fail to realize is that every time this debate makes the headlines, parents win. The truth about what is being done to our kids is evident to anyone who takes the time to look just one layer below the headlines. When the debate makes the front page again, our community grows.

Dr. Andrew Wakefield is perhaps this debate's greatest hero. He's a doctor who has held onto the truth, unbowed, through pressure that would break most mortals. Dr. Wakefield's influence in saving other children from the fate that befell so many children is incalculable.

While the GMC's ruling was completely expected, we are all blessed to have the unexpected courage of Dr. Andy Wakefield watching over our children.

With great respect and admiration,
Generation Rescue,
28 January 2010

Mark F. Blaxill

Naked Intimidation:
The Wakefield Inquisition is Only the Tip of the Autism Censorship Iceberg

Age of Autism, 29 January 2010
https://web.archive.org/web/20110523073630/http://www.ageofautism.com/2010/01/naked-intimidation-the-wakefield-inquisition-is-only-the-tip-of-the-autism-censorship-iceberg.html

"That's baseless conspiracy-mongering", some might counter, contending that any anecdote I might dig up is simply the normal process of scientific quality control. "Welcome to the real world", I respond, because this is something entirely new and disturbing. The deep and profound censorship occurring around autism science reaches depths that few casual observers can imagine.

I have proof.

There are no words to describe the findings of the General Medical Council (GMC). All I can say is that none of us should be surprised. The stakes had escalated far too high for the British medical establishment to countenance any other outcome. In the face of this parody of real justice, the only thing for the autism community to do now is stand by Andy Wakefield. Like him, we must not be intimidated; which is why I am proud to call Andy my friend. He is all of our friends.

We must also not forget two other fine men, John Walker-Smith and Simon Murch, men who have devoted their professional lives to healing the guts of sick children, and whose public reputations stand in tatters before the world, assaulted by the public health propaganda machine, victims of a modern day show trial. The GMC proceeding is a frightening and thoroughly modern form of tyranny. It makes you shudder to think what Stalin or McCarthy might have accomplished if their public relations had been more skillful and better organized.

The extremity of the GMC's verdict – all three men guilty on all counts – lays bare any pretense that the British medical establishment cares one whit about the welfare of its patients. Let's put in perspective the actions at issue here. No children were harmed and no parent or guardian has complained about the care these three men provided. In fact, the procedures involved were routine, the resulting treatments standard and the careful attention to gastrointestinal illness in autistic children has recently been endorsed by a consensus statement published in the journal Pediatrics (no friend of the autism community). Considered in this light, the GMC hearing process stands exposed for what it is. It was not about medical standards. It was not about evidence. It was not even civilized. It was, rather, a naked exercise in intimidation, a fateful moment of moral decision in which the medical industrial complex exposed its ruthless, repressive essence. They are a frightening bunch and their conduct here raises issues well beyond autism.

There are others who can and will speak to the particulars of the case: the accusations, the evidence, and the integrity of the witnesses for the prosecution. see =>

(1) https://web.archive.org/web/20110523092419/http://www.ageofautism.com/2010/01/dr-andrew-wakefield-that-paper.html // (2) https://web.archive.org/web/20110523092728/http://www.ageofautism.com/2010/01/-false-testimony-denies-lancet-doctors-a-fair-hearing.html

But it's important to remember that this trial has never really been about the three doctors. If it were, it would never have consumed so many millions of dollars and thousands of hours over more than two years. The real goal of this proceeding, what I have called The Wakefield Inquisition is to send a clear message to anyone – clinician or scientist – who dares step out of line like Wakefield did. And as parents and citizens, we all need to understand one thing: that message has been received loud and clear. see =>
https://web.archive.org/web/20110523092426/http://www.ageofautism.com/2010/01/from-the-roman-to-the-wakefield-inquisition.html

Over the last ten years I've had the privilege to interact with a wide range of scientists in several different fields. Many of them are wonderful people and first-class professionals. And in the course of those interactions I have observed common patterns. A few, like Jon Poling and Mark and David Geier, who have worked openly on behalf of our children, have suffered harsh public recriminations. But for every public example there are countless more private examples of intimidation, coercion and censorship. It's like an iceberg; the vast majority of the scientific censorship occurring in autism takes place below the waterline, invisible to the broader public.

"That's baseless conspiracy-mongering", some might counter, contending that any anecdote I might dig up is simply the normal process of scientific quality control. "Welcome to the real world", I respond, because this is something entirely new and disturbing. The deep and profound censorship occurring around autism science reaches depths that few casual observers can imagine.

I have proof.

Over the last ten years I have collected a number of private examples – some via conversation others via email – of individual scientists who have felt the cold hand of censorship when dealing with autism. They comprise a modest sample (my interactions are necessarily episodic) of what I believe to be a pervasive pattern of suppression. But it's an extensive sample nevertheless and in all instances the good-citizen scientist on the other side of the interaction has been troubled by it. In order to give some visibility to this mass of bad behavior lying below the waterline, I have decided to share a few of these examples here (I've observed many more than just this selection). In all cases, I have thoroughly disguised the identities (including name, age, gender, specialty and affiliation) and materially altered the words in order not to violate confidences and to protect the careers of the scientists involved.

But every single one of them is real.

Below the surface: scientific institutions behaving badly

Not every inquisition takes place in public. One researcher who has investigated the environmental causes of autism was brought up before a university panel on charges of misconduct. This charge was raised for blatantly political reasons by someone hostile to the environmental model of autism causation. The defense against the charges consumed months of this researcher's time and has had career threatening implications. Here is an excerpt from that researcher's discussion of this private proceeding.

Have been sidetracked/consumed with preparing my defense for the research misconduct proceedings instigated by X, but am looking forward to the opportunity to clear my name at least in this academic sphere. Unfortunately, the process has been less than transparent so that it is completely unclear as to how the charges came about (in acting to exclude X as a complainant, and thus the origin of these charges, the university failed to appreciate that a new committee not privy to what was provided might falsely assume that the original committee saw a problem), why I am being charged now, or even what specifically I am being charged with...but the noise from one individual has been clanging very hard looking for support for me to be fired.

Sanctions against non-compliant researchers need not reach the extreme outcome of a research misconduct action. Instead of overt punishment for past action, future career opportunities can be the vehicle for intimidation, and researchers who have published on a controversial autism issues can find themselves newly unwelcome in the grant review process. Since the National Institutes of Health (NIH) hold a virtual monopsony ("a sole or predominant buyer" in a particular market) on scientific research in the United State, NIH grant reviews are one prominent place where researchers can be effectively intimidated. One scientist, who authored a sensitive, previous publication, when asked to join in the effort to draft a review paper, demurred with the following explanation.

I have had two rejections of NIH grants in the last two weeks. This is most remarkable, in that the grants were not deemed good enough to even be scored. In my X years on the faculty, I have never had an unscored grant. Moreover, in one grant it is clear that there is a personal vendetta ongoing. This is not totally surprising but nonetheless disturbing. I am not ready to throw my career away, and I don't look at how Andy Wakefield has handled such problems as a good model for me. It is vital that the science of this problem get out, and this is where I want to focus my attention. Therefore, I have decided that I do not want my name on [this new review publication], for I don't need more persecution right now, and as good as the paper is (and I think it is extraordinary), it is not going to be a definitive scientific publication. I am enclosing a section I wrote-some of this is already included-feel free to use any of it.

If an intrepid researcher goes so far as to submit a paper for publication, that's where the more overt forms of censorship can enter in, all in the guise of "peer review." Admittedly, rejection at the point of peer review is a common part of science, but the autism problem is especially radioactive and is a place where have seen the unmistakable cold hand of censorship take many forms: some unwelcome research can be headed off at the pass, with journal editors making clear that papers on certain autism topics are unwelcome and won't even be sent out for review; or unwelcome papers can be sent to anonymous reviewers the editor knows to be hostile to the topic of environmental influences; in other cases, papers are rejected even in relatively progressive journals' peer review process for reasons that have little to do with scientific merit. Given the nature of peer review, there is little effective recourse if one or two selected reviewers make critical comments that are simply wrong or biased. Here's how one researcher described a recent rejection.

My paper was rejected today from the [Journal]. While some of the reviewers' comments could have been addressed in a revision, most of them revealed the reviewers obvious bias and purposeful efforts to suppress this paper. Having gone over the comments, most of them are simply gibberish.

Another form of intimidation can come more directly from colleagues, in the social network of "mainstream autism researchers." If a respected researcher takes the risk of making honest public comments about the possible role of environmental factors in autism, they can find themselves receiving "career advice" from their "friends" to keep their mouths shut. Here's an example of one such communication.

I am concerned that you may be perceived as a strong supporter of the environmental influence on the developmental of autism …. I am afraid this attribution to you will tarnish your reputation and your credibility in the mainstream autism research community...This is the second time that what you had to say came back to me and astonished me (what you said was perceived as supporting the influence of toxins as causes of autism), even though I consider it likely that what you actually said was probably distorted. I hope you will accept this missive as the result of my concern for you as investigator and clinician… as your friend I truly feel impelled to give you the perspective of an outsider who fears that such statements are going to harm you.

Even when a paper from a brave and principled researcher succeeds in ushering useful research through the hurdles of peer review, the uniquely treacherous terrain in autism can (and almost always does) affect the drafting process, editing choices and the interpretation placed on evidence that might be viewed in multiple ways. In numerous cases I have observed (without any inside connection) that published evidence has been interpreted so as to downplay environmental factors. In a number of cases where I have been able to hear the inside story from researchers on what took place in the editing process, it's clear how widespread biases and peer pressure can censor the interpretation of more open-minded members of a research team. Here's one example from a researcher who was asked about how evidence that clearly could have been interpreted to implicate environmental factors was downplayed.

On the other hand, some of the 'downplay' of environmental factors probably reflected differences in emphasis between the lead author and myself, and even more, the pressures of the reviewers (which influenced the lead author), who thought the paper showed that environment played a negligible role. Like my [topic X] paper of last year, this paper went through innumerable reviews.

The collapse of civil discourse in a closed society

As we organize ourselves as an autism community to call attention to the injustice done by the GMC decision, we must make clear that Andy Wakefield is not alone. He, Simon Murch and John Walker-Smith are simply the most prominent and visible victims of an increasingly ruthless and doctrinaire campaign by the medical industrial complex to suppress a long overdue revolution in autism science. Autism can no longer be explained through the orthodox lens (as a rare, brain-centered, inherited psychiatric disorder), but those who would attempt to offer alternative explanations (how rising rates might reflect environmental influences that provoke whole body developmental injury in vulnerable children) are facing a rising tide of intimidation and censorship. The GMC verdict, that honest scientists like Andy Wakefield have "failed in their duty", makes a mockery of the value of civil debate in an open society.

The medical industrial complex is closing ranks. It's time for responsible citizens – health consumers and principled scientists alike--to raise their voices in opposition.

Mark Blaxill is Editor-At-Large for Age of Autism.

SafeMinds Supports Dr. Andrew Wakefield

Age of Autism, 29 January 2010 at 05:43 AM
https://www.ageofautism.com/2010/01/safeminds-supports-dr-andrew-wakefield.html

GMC Rules Against Wakefield et al, Yet Medical Establishmen Agrees Further Study of GI Disease in Children with Autism Is Top Priority

Thursday, January 27, 2010 - Today the General Medical Council (GMC), the regulatory body for doctors in the UK, made findings of fact in connection to a complaint filed by journalist Brian Deer. The complaint alleged conflicts of interest and unethical research against Dr. Andrew Wakefield, Dr. John Walker-Smith and Dr. Simon Murch relating to their 1998 case series published in the Lancet. As a result of these findings, the GMC will now determine the severity and appropriate sanctions, which could go so far as the loss of their licenses to practice medicine.

SafeMinds is very disappointed by the GMC's findings The false testimony and the ensuing GMC FTP hearing have had the effect of delaying necessary research into cause and treatment for autism, and dissuading scientists from pursuing research relating to vaccines as a cause of chronic disease.

In the Lancet paper Wakefield et al reported a novel inflammatory bowel disease in 12 children with developmental regression (autism) and expressly stated that "We did not prove an association between measles mumps and rubella vaccine and the syndrome described." The conclusion drawn by the case series was that, "Further investigations are needed to examine this syndrome and its possible relation to the vaccine." The study's conclusion and call for additional research is often incorrectly misinterpreted as a call to discontinue immunization against measles, mumps and rubella.

It is widely known that many children with autism suffer from gastrointestinal disease and requires further scientific investigation and treatment. This field of research is in fact identified as a short term research priority in the Strategic Plan for Autism Spectrum Disorder Research issued by U.S. Department of Health & Human Services Interagency Autism Coordinating Committee (IACC). Additionally, the following organizations and agencies have also clearly stated the need for research related to the potential relationship between gastrointestinal disease and autism.

• The American Academy of Pediatrics (AAP) - Evaluation, Diagnosis, and Treatment of Gastrointestinal Disorders in Individuals With ASDs: A Consensus Report states "The evidence for abnormal gastrointestinal permeability in individuals with ASDs is limited. Prospective studies should be performed to determine the role of abnormal permeability in neuropsychiatric manifestations of ASDs." (Statement 5).
• AAP also says in their Recommendations for Evaluation and Treatment of Common Gastrointestinal Problems in Children With ASDs that "Well-designed trials are needed to develop an evidence base for optimal diagnostic and treatment strategies to manage gastrointestinal disorders in children with ASDs."
• The Center for Disease Control's (CDC) National CADDRE Study: Child Development and Autism states that, "A number of factors will be studied for their potential link with ASDs. These factors were picked after an in-depth look at existing studies...These factors include...Gastrointestinal features: The study will follow up on reports that children with autism have abnormal gastrointestinal function, and whether it might be related to the causes of autism."

Scores of parents have reported, including from the original group of 12, that Dr. Wakefield's work has brought great relief to their children when no other doctor was willing to take their medical condition seriously. While controversy will continue to rage regarding Dr. Wakefield and the MMR vaccine, his key point and interest has been validated time and again; many children with autism are experiencing great suffering due to co-existing gastrointestinal disease and further research is urgently needed to identify the cause and most effective treatments. SafeMinds supports these concerns and calls for additional research into gastrointestinal disease in individuals with autism.

SafeMinds is a charitable non-profit and leader in funding and advancing the science regarding mercury exposure as it relates to autism. Our expertise extends beyond mercury-related exposures to broader vaccine safety issues, as many of our Board Members hold government agency committee positions such as the Interagency Autism Coordinating Committee, various CDC Vaccine Committees, the Department of Defense Autism Spectrum Disorder Research Program and the National Vaccine Advisory Committee's Vaccine Safety Working Group.

Dr. Leonard Horowitz

Murdoch Tabloids Strike Dr. Wakefield To Market Deadly Vaccinations

Jeff Rensez, 31 January 2010
https://rense.com/general89/murd.htm

The PharmaMedia, led by Rupert Murdoch's tabloids, are making Dr. Andrew Wakefield a BigPharma patsy in their desperate effort to bandage the public's hemorrhaging confidence in vaccinations.

Rupert Murdoch's family and business partners are heavily invested in BigPharma, and are losing billions of dollars annually due to growing distrust of media propaganda and widespread aversion to vaccinations.

Murdoch's media, the most powerful in the world, claimed in their TimesOnline, that the public's rejection of MMR vaccinations was caused by Dr. Wakefield's publication inThe Lancet in which he and his co-authors evidenced links to autistic children from the mercury-laden shots.

Quite to the contrary, like the deadly H1N1 vaccine marketed for the 2009 "manufactured pandemic," there were hundreds of medical doctors and scientists who sparked worldwide concern over the MMR vaccine and others containing neurotoxic mercury.

According to BigPharma investigators, all vaccines function as though they were biochemical weapons of mass destruction; ideal for profitable depopulation.

Allegedly, Dr. Wakefield's ordeal with a kangaroo medical court is a blow to the heart of the anti-vaccination movement. In fact, it is just adding heat to the firestorm of condemnation focused on the revolving doors between BigPharma and the agents and agencies advancing propaganda and vaccination policies.

"The Lancet said it should not have published the study," the Associated Press reported, and that Wakefield's links to litigation against the manufacturers of the MMR vaccine were a "fatal conflict of interest."

"The most 'fatal conflict of interest' is Murdoch's private equity investments in the drug companies and vaccine makers that make people sick from side effects caused by their unsafe and largely ineffective products," reports Dr. Leonard Horowitz, Editor-in-Chief of Medical Veritas(Medical Truth) journal on whose advisory board Dr. Wakefield has honorably served for years.

Few people know that Rupert Murdoch serves as a director of the Associated Press, News Corporation, FOX News, Time Warner, and many more mainstream media companies including the TimesOnline that broke this story.

Propaganda is used to control people's minds, and vaccinations are used to contaminate people's bodies with agents that produce deadly debilitating diseases that are said to require medical management.

Controlling diseases and people this way, including the vast majority of autoimmune diseases and cancer patients, is obviously most profitable for the world's leading drug makers; especially Merck & Co., and GlaxoSmithKlein (GSK). James Murdoch, heir apparent to Rupert's fortune, oversees GSK's board of directors, according to the company's website.

Rupert's partners in pushing propaganda and public intoxications through vaccinations for global depopulation, include Thomas H. Glocer, director of Reuter's News Service and Merck & Co. Murdoch and Glocer are also partners in the David Rockefeller founded, Royal Family of England chartered, Partnership For New York City (PFNYC)--the world's most powerful drug ring and biotechnology consortium.

"Dr. Wakefield's crucifixion is a desperate well-orchestrated effort to restore faith in risky vaccinations that the majority of people worldwide no longer trust," said Dr. Horowitz.

"In its ruling, the disciplinary panel concluded that Wakefield acted dishonestly and was misleading in the way he described his study," the Murdoch-directed AP reported. Wakefield's medical jurists said he should have disclosed his expert witness fees paid by lawyers acting for parents whose children had been killed or damaged from vaccines.

"How's that for the pot calling the kettle black?" Dr. Horowitz asked Steve Gilmour on the BBC Affiliated Talk Radio Europe, referencing Murdoch's dishonesty and failure to disclose the financial reasons his newspapers persecute Dr. Wakefield. "Such yellow press exclusively benefits the Rockefeller-directed PharmaMedia." (Click here to listen to this interview on You Tube.)

In "Pharmaganda: A Study of Conflicting Interests," Dr. Horowitz, and Murdoch News Corporation defector and investigative journalist Sherri Kane, co-authored an expose on the PharmaMedia and their monopolization of medical education and public persuasion.

Horowitz and Kane investigatedDavid Rockefeller's leadership and partners in the PFNYC in which Rupert Murdoch serves as Co-Chair.

These authors concluded that the PharmaMedia's persecution of Dr. Wakefield further evidences a "hostile takeover" of science, medicine, and common sense.

This "conspiracy reality" is adequately detailed in the current issue of Medical Veritas(freely available online until February 15, 2009.)

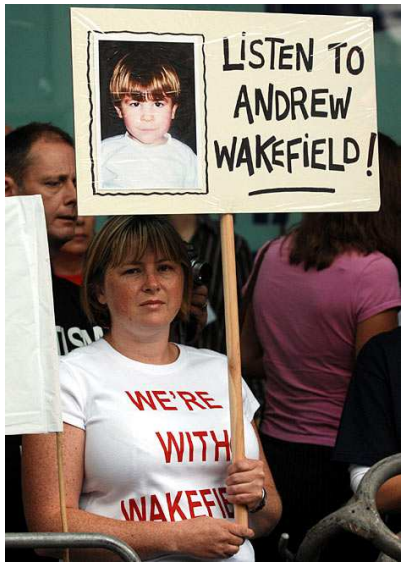
The other PFNYC Co-chair is Lloyd Blankfein, CEO of Goldman-Sachs who also directs ABC-Disney and AstroZeneca--a company that joined Merck & Co., and GlaxoSmithKlein, in producing H1N1 vaccines for world consumption.

"After the H1N1 vaccine fraud was exposed, more than half of the medical doctors worldwide, and more than sixty-percent of nurses in the UK and America, refused to take or give these deadly shots," Dr. Horowitz explained. "The billions of dollars of unsafe and generally-ineffective vaccines stockpiled by governments are now a major liability, not only financially, but in terms of reliability of the vaccine industry and information sourcing from David Rockefeller's malfeasant officials in the World Health Organization (WHO). After their 'shortage marketing' efforts failed, they began using every possible ploy to use up these deadly vaccines."

The PharmaMedia has published nothing about the EU Parliament Council's investigation of the WHO conspiring with the vaccine industry following the scientific fraud and public fright orchestrated by these suspects, Dr. Horowitz notes. He charges those aiding and abetting BigPharma, secreting this urgent information, with administering "iatrogenocide"--medical mass murder.

"Wakefield probably gave youngsters five pounds each at his son's birthday party as a gift for helping to advance legitimate vaccine science with parental permissions," Dr. Horowitz concluded. "It is pathetic this kindness is being used against him as an alleged ethics violation...."

"Dr. Wakefield is only guilty of joining hundreds of other scientists proving what common sense tells any reasonable person--injecting people with toxic chemicals and heavy metals, including mercury, in these biochemical weapons, called 'vaccinations,' is risky and often deadly."



Note to Journalists

The PharmaMedia has declared war against common sense and honest doctors. Dr. Leonard Horowitz, like Dr. Andrew Wakefield, was just targeted by SHOWTIME's producers of "Penn&Teller's Bullshit!" to be discredited for his endorsement of OxySilver - a natural alternative to risky vaccinations and deadly antibiotics. Dr. Horowitz and Ms. Kane organized a "counter sting" that will soon be made into a documentary titled, "PharmaWhores: The SHOWTIME Sting of Penn & Teller". Stay tuned to Dr. Horowitz's YouTube channel for movie trailer broadcasting soon. Watch for the launch of PharmaWhores.com

Dr. Horowitz's official website is DrLenHorowitz.com. He is the author of sixteen books including three American best-sellers, Emerging Viruses: AIDS & Ebola--Nature, Accident or Intentional?, Healing Codes for the Biological Apocalypse, and "Healing Celebrations: Miraculous Recoveries Through Ancient Scripture, Natural Medicine and Modern Science."

There is a courtesy copy of Medical Veritas, available free for online review for only 3 more weeks: CLICK HERE for Dr. Horowitz's commentary and link to "PHARMAGANDA: A Study of Conflicting Interests."

After February 15, 2010, there will be a $35 charge for accessing the Medical Veritasissue via pdf download, with individual articles in this issue available for separate purchase at $15 per download, including Dr. Harold Buttram's important article on the future of human DNA corrupted by the mutagenic viral injections accompanying childhood vaccinations.

Please help alert medical doctors about this report, and this free limited time access. Medical doctors and patients must be informed that their intelligence has been tainted by pharmaceutical special interests. This publication contains urgent life-saving knowledge.

The Devil's in the Detail

Andrew Wakefield

The Devil's in the Detail

Vaccine Risk Awareness Network, The Autism File USA, 34, 2010
https://web.archive.org/web/20100507091641/http:/www.rescuepost.com/files/autism-file-usa34-wakefield-2.pdf

Andrew Wakefield, MB, BS, FRCS, FRCPath is an academic gastroenterologist. He graduated in Medicine from St. Mary's Hospital (part of the University of London) in 1981, pursuing a career in gastrointestinal surgery with a particular interest in inflammatory bowel disease. He qualified as Fellow of the Royal College of Surgeons in 1985, and in 1996 was awarded a Wellcome Trust Traveling Fellowship to study small-intestine transplantation in Toronto, Canada. Discoveries made during his work in Canada led him to return to the United Kingdom to pursue the study of inflammatory bowel diseases such as Crohn's disease and ulcerative colitis.

In 1998, Dr. Wakefield and his colleagues at the Royal Free Hospital in London reported a novel inflammatory bowel disease in children with developmental disorders such as autism; the condition later became known as *autistic enterocolitis*.

He was awarded the Fellowship of the Royal College of Pathologists in 2001. Dr. Wakefield is involved in many scientific research collaborations in the United States and abroad centering on the immunologic, metabolic, and pathologic changes occurring in inflammatory bowel diseases such as autistic enterocolitis, links between intestinal disease and neurologic injury in children, and the possible relationship of these conditions to environmental causes, such as childhood vaccines.

During the course of his work on childhood developmental disorders, Dr. Wakefield was increasingly convinced of the need for a research-oriented, integrated biomedical and educational approach to these disorders, in order to translate clinical benefits for affected children into measurable developmental progress; this is the driving aim of Thoughtful House Center for Children in Austin, Texas.He has published over 130 original scientific articles, book chapters, and invited scientific commentaries.

The General Medical Council vs. Wakefield, Walker-Smith, and Murch. The research reported by you in The Lancet was substantially different from that for which approval was granted by the Ethical Practices Sub-Committee in that it related to: *i) Children with a diagnosis of autism and not disintegrative disorder ... Your actions were ... inappropriate, not in the best interests of patients, not in accordance with your professional ethical obligations, likely to bring the medical profession into disrepute, and fell seriously below the standard of conduct expected of a registered medical practitione*r.

The foregoing is a charge made by the General Medical Council in 2004. The subject matter was "That Paper" (see also The Autism File, 2009; Issue 33) – The Lancet paper of 1998 that first reported intestinal disease in children with developmental regression. Notwithstanding the fact that in his enthusiasm Mr. Dobson got the wrong Ethical Sub-Committee approva,[1] and the wrong research protocol for the wrong children…there is so much more to this esoteric charge than meets the eye, and the "more" deserves scrutiny. Let's rewind to 1995-7, armed with the enduring adage "if in

doubt examine the patient." Among the presenting clinical features of The Lancet children were some that were apparently uncharacteristic of autism, at least as it was generally understood at that time. For all 12 children, these included normal or nearnormal early development, a clearly delineated onset of behavioral/developmental symptoms, and loss of previously acquired skills. In addition, four children had become incontinent after previously having been potty-trained, while seven children had developed obvious clumsiness (ataxia), a motor symptom clearly indicative of central nervous system dysfunction (encephalopathy). In contrast with the cold, aloof child described by Kanner, many of these children were affectionate, to the extent that doctors had sometimes been unwilling to make an autism diagnosis.

The combination of these atypical features along with the fact that, for the majority, there was onset following an infectious (vaccine) exposure, led our colleagues in the Department of Child Psychiatry at the Royal Free Hospital to suggest that what we were dealing with was not Kanner's autism, but Childhood Disintegrative Disorder [Panel 1].

Childhood Disintegrative Disorder

In 1908, many years before the publication of Kanner's seminal case-series on autism, Theodore Heller, a remedial educator in Vienna, described a new syndrome – dementia infantilis (later to become CDD) – in the *Journal for Research and Treatment of Juvenile Feeblemindedness*.[2]

CDD is a Pervasive Developmental Disorder that fulfills behavioral criteria for Childhood Autism/Autistic Disorder, but where the pattern of onset is different. CDD requires documented normal or near-normal development[3] up to 24 months of age with subsequent regression and loss of skills in at least two of the following: expressive/receptive language, play, social/adaptive skills, continence, and motor skills [Panel 1].

You might reasonably ask, "But isn't CDD just autism with a later onset and regression?" Later onset following a period of normal development means there are skills to be lost. If the onset occurs after a child is potty-trained, for example, continence may be one of the skills that suffer. And where did 24 months come from? Surely this is entirely arbitrary – an artifact created to satisfy a need to categorize in the absence of a better understanding of the origins of the disease? What do the experts have to say?

- Hill and Rosenbloom noted that, "Unlike the vast majority of children with early infantile autism [children with CDD] undoubtedly showed a period of early normal development, including the acquisition of normal language and normal social relationships".[4]

- They observed that the child usually "comes to look very autistic, such that the clinical presentation, but not the history [i.e., regression] is then typical of a child with autism".[3] Rosenbloom cites Professor Sir Michael Rutter as making age of onset a major criterion for diagnosis of CDD[3] in distinguishing it from autism.

- In defiance of Rutter, Malhotra and Gupta noted that "at closer look the age range has varied from 1.2 years (Evans-Jones and Rosenbloom, 1978) to 9 years (Corbett et al., 1977)".[5] Accordingly, they conclude, "it can be hypothesized that disintegrative disorder [CDD] may be a late-onset variant of autism."

- Russo and colleagues reinforce this view: "Indeed, in many aspects the clinical features [of CDD] are indistinguishable from those of autism, and the differentiating factor is the period of normal early development".[6]

- Malhotra and Gupta noted that "It has been observed that children with CDD have a clearly delineated onset and regression, especially for loss of previously acquired skills, which is absent from autistic disorders".[5]

- The International Classification of Disease [ICD]-10 itself acknowledges the current "...uncertainty about the extent to which this condition [CDD] differs from autism... ".[7]

- The final word goes to Hendry who, in a detailed review of the subject, concluded that "the variables upon which CDD is currently distinguished from Autistic Disorder are not well substantiated".[8] She continued, "CDD should not yet be considered distinct from Autistic Disorder, as not enough information exists to justify it as a separate diagnostic category." Further, she stated

that "pervasive developmental disorders could be regarded as a continuum, or spectrum disorder and CDD could be considered a point or range of points along this continuum of behavioural expressions."

In fact, the presenting features of CDD are identical to those of autism with respect to the core symptoms. The key difference lies in the history of normal or near-normal development and regression. The symptoms of CDD fit *The Lancet* 12 very well.

So, while opinions differ, any residual distinction appears to hang on the flimsy contrivance of age of onset. For Rutter, as a key prosecution witness at the GMC hearing, however, the matter was black and white. When asked whether "in embarking on a study of children with behavioral disorder, would [he] expect a distinction between CDD and autism to be made," he replied, "Yes." He continued, "and the literature would support drawing a clear distinction at the time [1996]." It is somewhat surprising, therefore, to find that he had earlier written[9] that "The clinical picture [in CDD] after the phase of regression is often somewhat similar to autism and the differentiation may be difficult, if not impossible, in cases with an onset before 30 months." It is notable that regression and onset before 30 months applies to virtually all of *The Lancet* 12.

Also notable among the other clinical features of CDD evident in The Lancet 12 are loss of coordination, secondary incontinence, and, in contrast with "classical" autism, expression of affection.[2,6] Might it simply be that affection, for example, does not make CDD a distinct disease but a different expression of the same disease because, unlike the child with classical autism, the child with CDD has had several years of normal development in which to experience and enjoy affection?

It would seem that Rutter is somewhat isolated in his categorization of childhood developmental disorders by age of onset. Indeed, it is arguably naïve to conceptualize disease in this way, when age of onset may simply better explain differences in presentation. In arguing for splitting autism and CDD, he stated that "although the onset differs from that which is usual in autism, the clinical picture in the two groups of conditions shows many similarities. Nevertheless… for the moment it seems highly desirable to retain [CDD] as a separate category because it is important (a) to recognise that often the syndrome is caused by organic brain disease (b) to appreciate that in some cases the aetiology remains quite unknown; and (c) to accept that the nature and extent of the overlap [with atypical autism] is unknown".[9]

Rutter's reasoning is curious; all three points apply equally to autism – atypical or not – and CDD. Both may be caused by organic brain pathology; in most cases of CDD and autism the cause is unknown; and, since "the nature and extent of the overlap is unknown," there is little justification for categorizing them separately.

And even now the concept of regression itself appears to be morphing. Whereas, in the past, regression appeared to have been a key distinguishing feature between autism and CDD, Rutter now maintains that regression has always been a common feature of autism.

During his expert evidence at the GMC10, Rutter expressed the opinion that for autism "a transient period of regression occurs in 25-30% of cases and is usually temporary." This appears to be at odds with the prior claim that regression was not seen "for the vast majority of children with infantile autism".[4] Rutter may have been referring to temporary loss of language in autism, although this was not clear from his testimony that appeared to focus on The Lancet.[12]

At the heart of the GMC hearing is a defense of the MMR vaccine. Stepping back from the pernicious lies, the political angst and the cries for blood, it may be valuable to gain some historical vantage point from which to judge scientific concerns about measles virus, vaccines, and developmental disorders. Take for example the presentation of Dr. Daynes to the Royal Society of Medicine in 1956 [Panel 2]. Herein he describes, for all the world, what we see in a clinical setting on a daily basis; apparently there is nothing new.

It is perhaps unsurprising that a further common denominator for some cases of autism and CDD is the causal role of measles virus. This virus, either in its natural or vaccine forms, has been causally linked to childhood developmental disorders, including autism,[13-16] and developmental regression.[17]

In utero exposure to measles is associated with autism. Deykin and MacMahon compared exposure patterns of 183 children with autism and 355 sibling controls to the encephalitogenic (causing brain inflammation) viruses, measles, mumps, rubella, and chickenpox. They found that "total autistic symptomatology seems to be associated with prenatal experience with measles and mumps".[13]

In support of a causal role for prenatal measles in autism, Ring et al., used sophisticated statistical modeling of the number of autism births in Israel compared with epidemics of measles, rubella, poliomyelitis, viral meningitis (inflammation of the lining of the brain) and viral encephalitis (inflammation of the brain) and found that peaks in the number of births of children with autism followed peaks of epidemics of measles and viral meningitis.[14]

The authors concluded that "Autistic birth patterns are partially explained by the rates of measles and viral meningitis [incidentally a frequent feature of measles[18]] in the general population. There is a statistically significant environmental association between autism and both viral meningitis and measles that should be further investigated".[14]

CDD has been reported following natural measles infection, and cases have been reported in association with subacute sclerosing panencephalitis, a measles-related encephalitis.[19]

In the case of CDD and measles, Rutter himself wrote that profound regression and behavioral disintegration is often accompanied by a "premonitory period of vague illness, [when] the child becomes restive, irritable, anxious and overactive… Sometimes these conditions come on after measles, encephalitis or other clear-cut organic illnesses".[20]

Among five children who fit the criteria for CDD, Volkmar et al. described a child with onset of behavioral decline following measles encephalitis.[21] Hudolin reported that, prior to regression, a 15-year-old boy with limited speech, stereotyped and repetitive play, and poor self-care skills, etc., suffered from an unknown strain of measles and high fever at approximately 30 months.[22] Malhotra and Gupta confirm that many cases have been associated with some medical condition such as measles.[5]

Vaccines have been associated with CDD; for example, in a report of 12 cases in India seen between 1989 and 1998, Malhotra and Gupta noted onset in four cases with onset following either fever with seizures, acute gastroenteritis, and vaccination. The type of vaccine was not stated.[23]

Dwelling briefly upon the clinical features of ataxia in combination with developmental regression, potentially novel adverse events associated with the combined MMR vaccine, rather than the monovalent component vaccines, have emerged from Plesner's Danish study of ataxia following MMR.[24] Earlier studies had indicated that ataxia with gait disturbance might occur in up to 1 in 1000-4000 recipients of MMR.[25,26] In Denmark this association had not been detected with any other vaccine administered to children of the same age prior to the introduction of MMR in 1987. In a follow up of the mandatory passive reporting system for vaccine adverse events operated in Denmark, Plesner not only confirmed this association but also indicated that the more severe ataxias following MMR may be associated with residual cognitive deficits in some children,[24] a finding of specific relevance to the MMR-autism debate.

Rutter remains steadfast, however. On behalf of the defendants in U.S. vaccine court and elsewhere, he has taken the position that vaccines are not a cause of autism. Given his pre-eminence, this position is likely to have been highly influential. Meanwhile, the first reported association between vaccines and autism came, not in 1998 with The Lancet paper, but in 1993.[27,28] This earlier report took a robust position on the vaccine's likely culpability, certainly compared with the restrained statements in The Lancet paper of 1998. In 1993, the authors described 11 children with autism who were excluded from a genetic study based on their having a "medical condition of possible aetiological [causal] importance." The authors stated, "Only eight of the cases can be regarded as having a probably causal medical condition, [including] a child with epilepsy and a temporal lobe focus on the EEG who had an onset following immunization".[27,28]

While the hopes of many desperate parents lie dashed upon the cold marble of the courthouse, it is but an ironic postscript that Professor Sir Mchael Rutter, FRS was the senior author of that paper.

Conclusion

It is proposed that autism and CDD are on the same continuum of clinical disease. Measles virus exposure has been linked to both CDD and autism. The timing of this exposure – i.e., early (in utero) or later, in childhood – may determine the clinical presentation, including the presence and extent of regression. Infantile autism without regression may be linked to early exposure, whereas CDD with regression may be linked to later exposure. It is entirely plausible that measles, in combination with two other viruses which have themselves been linked independently to autism – as MMR – may increase the risk for this condition in certain children. Whether or not MMR is guilty as charged remains to be determined.

Panel 1: CDD or Heller's Disease

From around the age of 2 through 10, acquired skills are lost almost completely in at least two of the following six functional areas:

- Language skills
- Receptive language skills
- Social skills & self-care skills
- Control over bowel and bladder
- Play skills, and Motor skills

Lack of normal function or impairment also occurs in at least two of the following three areas:

- Social interaction
- Communication
- Repetitive behavior & interest patterns

Panel 2: Measles – bowel – behavior – gluten

Dr. Guy Daynes. *Bread and Tears* – Naughtiness, depression, and fits due to wheat sensitivity.

Royal Society of Medicine – February 15, 1956

"Typically a child between 1 and 5 years becomes naughty and difficult a few days after the onset of an acute infectious illness... such as measles or gastroenteritis.

He is irritable, negativistic, and spiteful, sleep is disturbed and he wakes up in thse night and often screams; his appetite is poor, he fails to gain weight, his abdomen is often distended and the stools may become bulky, pale and offensive. This condition, if left untreated, usually rights itself after a month or two, but it may last for much longer in which case slight petit mal attacks may develop in addition to worsening of the other symptoms.

I have been placing these children on a gluten-free diet at the earliest opportunity and the symptoms respond dramatically, usually within two or three days. They relapse if a premature return to a normal diet is made.

Study of over 40 cases has led me to formulate a syndrome – pre-coeliac syndrome."

CBC

Autism-vaccine study retracted CBC News

CBC, 2 February 2010, 9:42 AM EST
https://www.cbc.ca/news/science/autism-vaccine-study-retracted-1.807219

A medical journal in Britain has retracted a controversial study it published in 1998 that linked the use of a vaccine in children to autism. The study retracted on Tuesday looked at 12 children suffering from colitis, a gastrointestinal disease.

British surgeon and medical researcher Andrew Wakefield concluded a component of the measles, mumps and rubella, or MMR, vaccine caused the colitis, which in turn led to development problems that are part of autism spectrum disorder. "It has become clear that several elements of the 1998 paper by Wakefield … are incorrect," The Lancet said in a statement.

Since the controversial paper was published, British parents abandoned the vaccine, leading to a resurgence of measles in the U.K. and elsewhere in Europe.

Subsequent studies have found no proof that the vaccine is connected to autism, though some parents are still wary of the shot. In March 2004, the majority of co-authors on the paper retracted their support for the claims of a possible link between the vaccine and colitis or autism.

'Callous disregard'

A disciplinary panel of Britain's General Medical Council ruled last week that Wakefield had presented his research in an "irresponsible and dishonest" way and shown a "callous disregard" for the suffering of the children he studied. It also ruled he had brought the medical profession "into disrepute."

Wakefield and the two colleagues who have not renounced the study face being stripped of their right to practise medicine in Britain.

For the study, Wakefield took blood samples from children at his son's birthday party, paying them five pounds each ($8) for their contributions and later joking about the incident. Meanwhile, fallout from the publication of the study continues.

"It was out there for a very long time. So it's good The Lancet has retracted it. It helps in a small way. But the truth of the matter is the damage has been done," in terms of changes in belief and perception, said Dr. Allison McGeer, an infectious diseases expert at Toronto's Mount Sinai Hospital.

Costs of retraction delay

The retraction is important, but the time it has taken to get to this point dulls its impact, said Dr. Evdokia Anagnostou, a clinician scientist at Bloorview Research Institute in Toronto.

"There is room to study the link between the immune system and autism," she added. "Still, I don't think we have clarified that issue, and I would hope that the money goes towards that route and not again on the MMR hypothesis."

It took a lot of time and effort to debunk the hypothesis, agreed Dr. Bonnie Henry, chair of the Canadian Coalition of Immunization Awareness and Promotion.

"If the amount of money and time and effort had been put into understanding autism, they might have made a lot more gains," in understanding the mechanisms behind the disorder, how to prevent it, and better integrate children with autism into society, Henry said from Ottawa.

Mumps outbreaks

The medical publishing industry has made strides to ensure trials are registered properly, people are reviewed appropriately and that conflicts of interest are prominent so people can make up their own minds in controversial areas, Henry added.

Concerns about the MMR vaccine spread to Europe and North America.

In 2007, a large outbreak of mumps was set off in the Maritimes after the virus was imported from the United Kingdom, said Dr. Noni MacDonald, a pediatric infectious diseases expert at Dalhousie University in Halifax.

More than 1,000 cases were recorded over a period of months as that outbreak spread across the country.

Wakefield remains outspoken and said last week that the panel's findings were "unjust and unfounded." His supporters believe he has been the subject of a conspiracy to discredit him

Los Angeles Times

Report linking autism to vaccines is retracted by medical journal

The Los Angeles Times, 2 February 2010, 9:34
https://web.archive.org/web/20100205075405/http://www.latimes.com/news/nation-and-world/la-sci-wakefield3-2010feb03,0,38071.story

The Lancet issues a retraction on the 12-year-old paper by Dr. Andrew Wakefield, which had said the measles-mumps-rubella vaccine causes autism. The report led to a sharp drop in vaccination rates.

Twelve years after Dr. Andrew Wakefield published his research in the international medical journal the Lancet purporting that the measles-mumps-rubella vaccine causes autism, the journal on Tuesday formally retracted the paper.

The action came less than a week after the U.K. General Medical Council's Fitness to Practice Panel concluded that Wakefield had provided false information in the report and acted with "callous disregard" for the children in the study. The council is now considering whether Wakefield is guilty of serious professional misconduct. A positive finding could cause him to lose his medical practice.

Wakefield's study, conducted on only 12 children, concluded that the MMR vaccine is a primary cause of autism. He subsequently said that he could not, in good conscience, recommend that parents have their children vaccinated.

His words and actions led to a sharp drop in vaccination rates in both Britain and the United States and a resurgence in measles. Despite multiple subsequent studies that have refuted the link, vaccination rates have remained lower than they were before his report, and many parents remain concerned about the potential effects of the lifesaving vaccines.

"This will help to restore faith in this globally important vaccine and in the integrity of the scientific literature," Dr. Fiona Goodlee, editor of the BMJ – formerly the British Medical Journal – said Tuesday in a statement. On Monday, Goodlee had joined the chorus of scientists urging Lancet to withdraw the paper.

The original report "was outrageous," said Dr. Jeffrey Boscamp of the Hackensack University Medical Center in New Jersey. "Most of the authors asked for their names to be removed from the study. It's unfortunate that it undermined confidence in vaccines when in fact it wasn't true at all."

Wakefield, who now practices in Austin, Texas, said the accusations against him were "unfounded" and "unjust." Other researchers, however, are happy to put the episode behind them so they can go on with the difficult task of finding the true causes of the disorder.

Le Lancet et le Dr. Wakefield

Silence on Vaccine, 4 February 2010
https://web.archive.org/web/20100507091641/http://linabmoreco.wordpress.com/2010/02/04/le-lancet-et-le-dr-wakefield/

Nous sommes au début du mois de février 2010 et le Lancet annonce qu'il n'endosse plus l'article du Dr Wakefield réalisé en 1998 concernant le lien entre l'autisme et vaccination. Du coup plusieurs vieux écrit sur son sujet sorte des tablettes pour nous raconter encore une fois à quel point ce médecin est malhonnête. Voir Article du Daily Mail et un autre point de vue, plus critique du site Age of Autism.

Mon point de vue:
Au cours de la réalisation du film «Silence on vaccine», j'ai eu le plaisir de rencontrer le docteur Wakefield au Texas ainsi que beaucoup de parents dont les enfants Autistes, ont été soigné au sein de sa clinique. Ses découvertes et ses recherches sont aujourd'hui fondamentales voire incontournables pour améliorer les conditions de vie des enfants atteint d'autisme. Je parle ici du lien entre: Intestin – intoxication (vaccinale ou environnementale) et autisme.

Ce qui est dommage avec la rétractation du Lancet c'est que les médias ne posent pas de questions sur les motivations du Lancet. Qui a pris cette décision ? Dans quel but ? Pourquoi en ce moment après 12 ans ? Qui sont les nouveaux joueurs au Lancet ? Ce serait bien d'avoir un regard critique sur cet autre côté de la nouvelle. De regarder à l'arrière de l'image projetée, cette sorte d'inquisition de la vérité.

Mais pour en revenir avec le docteur Wakefield, il serait intéressant de savoir ce qui motive autant cette médiatisation démesurée.

À mon avis deux choses dérangent:
- D'abord il questionne l'efficacité des vaccins – 1er tabou.
- Ensuite ll effectue des recherches sur les causes de l'autisme et s'intéresse aux protocoles de soins et de guérison - 2e tabou.

Il touche à deux sujets extrêmement délicats. Le lien entre l'intestin, l'intoxication (vaccin et environnement) et l'*autisme ou trouble envahissant du développement*.

Il bouscule tout un establishment de chercheurs qui grassement subventionnés, n'ont pas encore trouvé des solutions médicales à l'autisme et nient tout lien de causalité autre que génétique, alors qu'aujourd'hui nous faisons face à une épidémie d'enfant autiste. Un enfant sur Cent est atteint au Canada, en France, aux États-Unis, en Angleterre pour en nommer que quelques-uns. Ce n'est plus une question de génétique seule.

Alors le docteur Wakefield dérange.
On écrit qu'il est coupable de ne pas avoir respecté certains protocoles de recherches. Qu'il a été subventionné par des intérêts… Hum.. Est-ce un motif raisonnable ? Il y a tant de recherches scientifiques de par le monde, qui sont majoritairement financées par l'industrie pharmaceutique et qui sont publiées avec conflits d'intérêts annoncés - croyez vous qu'elles sont toutes respectueuses des protocoles? Non. Ils trichent aussi et très souvent. Le pire, leur recherche sont acceptées les yeux

fermées par nos organismes de surveillance de santé. On a qu'à lire un article de Marcia Angell du New England Journal of Medicine - Insustry-sponsored clinical research, A broken system, – ou son livre: La vérité sur les compagnies pharmaceutiques - pour comprendre l'étendue du contrôle qu'elle exerce sur les recherches, et sur ce qui doit être publiée ou non.

L'industrie est extrêmement compétitive surtout lorsqu'elle est entrain de dépenser des sommes d'argent considérables sur des recherches concernant le génome de l'autisme. Elle ne peut pas laisser se développer un concept ou une thérapie alternative qui puisse aider de manière significative les enfants autistes et parfois les guérir. Il lui faut mettre un frein.

Le plus drôle, c'est qu'on criera au miracle lors de la sortie d'un médicament contre l'autisme. On ne posera pas de question. Socialement tout le monde acceptera du jour au lendemain que l'autisme puisse se guérir. L'industrie l'aura dit, alors ce sera vrai.

Entre-temps, en niant l'innovation qui n'est pas issue de l'industrie pharmaceutique, en méprisant les efforts des parents et des chercheurs qui tentent d'aider les enfants autistes autrement que par les médicaments, et qui réussissent à le faire à l'abris des regards, c'est à nous que nous nuisons. Nous jouons le jeux de l'industrie. Nous lui laissons droit de regard sur tout ce qui concerne notre santé.

Dans le film ***Silence, on Vaccine***, la majorité des enfants qui avaient reçu un diagnostique d'autisme vont aujourd'hui à l'école. Ils ce sont considérablement améliorés. *Certains des médecins qui les avaient diagnostiqué ont refusé de savoir ce que les parents avaient fait pour aider leur enfant*. Même chose au Québec. Les parents m'ont témoigné de leur stupéfaction face aux médecins qui, *découvrant la nette amélioration de santé de l'enfant, leur ont signifié qu'ils ne désiraient plus les voir* au lieu de s'intéresser au protocole de soins qui avaient produit de tels résultats. Pas étonnant que le sujet de la disparition des symptômes de l'autisme chez un enfant, reste Tabou.

Je tiens à préciser que selon les rencontres que j'ai eu avec les parents d'enfants autistes, on peut convenir qu'un enfant atteint d'autisme peut à des degré différents, selon l'âge, la gravité de l'atteinte, le protocole de soins, améliorer sa condition de santé.

Voici une lettre envoyé par un parent. Elle est sur mon site. Cette lettre reflète dans son ensemble ce que tous les parents d'enfants autrefois autistes m'ont raconté.

Je suis la mère d'un enfant qui fut victime de vaccins, plus précisément le RRO de 12 mois. Suite à cela, notre vie a basculée et a pris un tournant que l'on aurait jamais imaginé. Notre cher enfant qui était joyeux et agréable, fut transformé en enfant hyperactif, agressif avec des sauts d'humeurs. De plus, il développa des difficultés avec son langage réceptif et expressif. Il était défensif au niveau sensoriel et il avait souvent des maux de ventre et de la diarhée. Les médecins et professionels nous on dit qu'il avait aucun lien entre ses nouveaux comportements et sa réaction face au vaccin. Nous avons essayés plusieurs formes de thérapies, tel que ABA, ergothérapie, orthophonie, thérapie d'intégration auditif, etc. Nous avons remarqué quelques améliorations qui semblaient limitées et qui nécessitaient quand même une accompagnatrice à la garderie et l'école.

J'ai commencé à voir des liens entre les aliments que mangeait notre fils et son comportement. J'ai trouvé celà intéressant, car j'étais diéticienne. Mais mon entrainement professionel à McGill, m'a pas sensibilisé au fait que la nutrition puisse jouer un rôle important dans le comportement, dévelopement du language ou l'apprentissage d'un enfant. Au début de 2006, j'ai participé à une conférence et formation professionelle de DAN! (Defeat Autism Now!). A ce moment là, j'ai découvert les recherches qui établissaient le lien probable entre la vaccination et les difficultés qu'éprouvait notre fils. Heureusement, je trouvais espoir dans une approche integré qui visait l'enfant sur un plan individuel. *Avec des changements alimentaires, des suppléments pour améliorer sa biochimie et un désintoxification de métaux lourds, notre fils est presque rétabli*! Il est heureux, plus sociable, a des amis et va à une école conventionnelle sans support!

GENERATIONRESCUE

Andrew Wakefield

Scientific Censorship, and Fourteen Monkeys

A statement from Jenny McCarthy and Jim Carrey

Generation Rescue, Los Angeles, 5 February 2010

https://web.archive.org/web/20100209193653/http://www.generationrescue.org/wakefield_statement2.html

Dr. Andrew Wakefield is being discredited to prevent an historic study from being published that for the first time looks at vaccinated versus unvaccinated primates and compares health outcomes, with potentially devastating consequences for vaccine makers and public health officials.

It is our most sincere belief that Dr. Wakefield and parents of children with autism around the world are being subjected to a remarkable media campaign engineered by vaccine manufacturers reporting on the retraction of a paper published in *The Lancet* in 1998 by Dr. Wakefield and his colleagues.

The retraction from *The Lancet* was a response to a ruling from England's General Medical Council, a kangaroo court where public health officials in the pocket of vaccine makers served as judge and jury. Dr. Wakefield strenuously denies all the findings of the GMC and plans a vigorous appeal.

Despite rampant misreporting, Dr. Wakefield's original paper regarding 12 children with severe bowel disease and autism never rendered any judgment whatsoever on whether or not vaccines cause autism, and *The Lancet*'s retraction gets us no closer to understanding this complex issue.

Dr. Wakefield is one of the world's most respected and well-published gastroenterologists. He has published dozens of papers since 1998 in well-regarded peer-reviewed journals all over the world. His work documenting the bowel disease of children with autism and his exploration of novel ways to treat bowel disease has helped relieve the pain and suffering of thousands of children with autism.

For the past decade, parents in our community have been clamoring for a relatively simple scientific study that could settle the debate over the possible role of vaccines in the autism epidemic once and for all: compare children who have been vaccinated with children who have never received any vaccines and see if the rate of autism is different or the same.

Few people are aware that this extremely important work has not only begun, but that a study using an animal model has already been completed exploring this topic in great detail.

Dr. Wakefield is the co-author, along with eight other distinguished scientists from institutions like the University of Pittsburgh, the University of Kentucky, and the University of Washington, of a set of studies that explore the topic of vaccinated versus unvaccinated neurological outcomes using monkeys.

The first phase of this monkey study was published three months ago in the prestigious medical journal *Neurotoxicology*, and focused on the first two weeks of life when the vaccinated monkeys received a single vaccine for Hepatitis B, mimicking the U.S. vaccine schedule. The results, which you can read for yourself here, were disturbing. Vaccinated monkeys, unlike their unvaccinated peers, suffered the loss of many reflexes that are critical for survival.

Dr. Wakefield and his scientific colleagues are on the brink of publishing their entire study, which followed the monkeys through the U.S. childhood vaccine schedule over a multi-year period. It is our understanding that the difference in outcome for the vaccinated monkeys versus the unvaccinated controls is both stark and devastating.

There is no question that the publication of the monkey study will lend substantial credibility to the theory that over-vaccination of young children is leading to neurological damage, including autism. The fallout from the study for vaccine makers and public health officials could be severe. Having denied the possibility of the vaccine-autism connection for so long while profiting immensely from a recent boom in vaccine sales around the world, it's no surprise that they would seek to repress this important work.

Behind the scenes, the pressure to keep the work of Dr. Wakefield and his colleagues from being published is immense, and growing every day. Medical journals take extreme risk of backlash in publishing any studies that question the safety of the vaccination program, no matter how well-designed and thorough the research might be. Neurotoxicology, a highly-respected medical journal, deserves great credit for courageously publishing the first phase of this vaccinated monkey study.

The press has been deeply misled in the way *The Lancet* retraction, and Dr. Wakefield's mock trial, have been characterized. Led by the pharmaceutical companies and their well-compensated spokespeople, Dr. Wakefield is being vilified through a well-orchestrated smear campaign designed to prevent this important new work from seeing the light of day.

What medical journal would want to step in front of this freight train? Moreover, why now, after 12 years of inaction, did *The Lancet* and GMC suddenly act? Is it coincidence that the monkey study is currently being submitted to medical journals for review and publication?

We urge the media to take a close look at the first phase of the monkey study discussed above and to start asking a very simple question: What was the final outcome of the 14 primates that were vaccinated using the U.S. vaccine schedule and how did that compare to the unvaccinated controls?

The U.S. vaccine schedule has grown from 10 vaccines given to our children in the 1980s to 36 today, perfectly matching the dramatic rise in autism. The work of Dr. Wakefield and his colleagues deserves to be shared with the world to further, rather than censor, scientific progress.

The same article is below

Mike Adams

Andrew Wakefield, Scientific Censorship, and Fourteen Monkeys; A statement by Jenny McCarthy and Jim Carrey. – Natural News, 6 February 2010

https://www.naturalnews.com/028109_Andrew_Wakefield_Jenny_McCarthy.html

When it comes to vaccines, Jenny McCarthy and Jim Carrey get it. They see how the pharma industry is engineering a campaign to silence Dr. Andrew Wakefield in order to suppress the publication of startling new evidence linking vaccines to severe neurological damage.

At great risk to their professional careers, Jenny McCarthy and Jim Carrey have found the courage to dare to tell the truth about vaccines and autism. Despite the vicious attacks by the pro-vaccine zealots who will stop at nothing to destroy anyone who challenges conventional vaccine mythology, McCarthy and Carrey have issued a powerful, inspired statement that reveals the truth behind the Big Pharma smear campaign that is intent on destroying the reputation of Dr. Andrew Wakefield before he can publish the final results of this important new study.

Dr. Leonard Horowitz

Vaccine Science Poisoned by Special Interests in PharmaMedia

Jeff Rensez, 5 February 2010
https://rense.com//general89/lancet.htm

The editors of Medical Veritas journal have condemned The Lancet'sretraction of the controversial study by Dr. Andrew Wakefield, charging editor Richard Horton with pandering to special interests in a conspiracy to defraud the public about the risks of vaccinations.

In 1998, The Lancet published the contested study linking autism and intestinal problems to the risky MMR triple virus vaccine. Yesterday, following the British General Medical Council's decision that Dr. Wakefield had been "dishonest," The Lancet's editor retracted the article saying the Council's report made it "utterly clear, without any ambiguity at all, that the statements in the paper were utterly false."

In a letter to the Los Angeles Times, Dr. Gilbert Ross, medical director of the pro-vaccine industry American Council on Science and Health, wrote, "The retraction . . . comes far too late. Even now, Horton fails to accept responsibility for the human toll he engendered by publishing the Wakefield 'study.'. . ."

"On the contrary," wrote Dr. Leonard Horowitz, Editor-in-Chief of Medical Veritas. "Dr. Horton's delay is best explained by his aversion to self incrimination and conspiring to cover-up iatrogenocide – the medical mass murder of innocent people for profit."

The Winter, 2010 issue of Medical Veritas, evidenced gross conflicting interests undermining the The Lancet's integrity. Following the publication of Dr. Wakefield's controversial study, Reed-Elsevier-ChoicePoint mergers occurred. The mega-company formed has nearly monopolized the medical scientific publishing industry. Previous to this, The Lancet editors protested the "damaging" of medicine and health science by pharmaceutical companies.

"Now it is obvious Dr. Horton's company has been grossly contaminated by special interests as biased as Dr. Ross's 'PharmaCouncil'," Dr. Horowitz said.

Reed-Elsevier-ChoicePoint, it turns out, is directed by Chief Executive Officer, Sir Crispin Davis, according to a Reuter's News Service promotion for GlaxoSmithKline recently published. According to Forbes, Sir Davis was knighted by the Queen of England for his "service to the information industry." He has served as a Non-Executive Independent Director of GlaxoSmithKline, PLC since 2003. Sir Davis spent his early career with Procter & Gamble.

Reuter's News Service, key to the British "information industry," is directed by Editor-in-Chief, Thomas H. Glocer, who serves on the Board of Directors of Merck & Co., which admittedly paid Reed-Elsevier to publish pseudo-scientific articles and fraudulent medical journals, including the Australasian Journal of Bone and Joint Medicine. According to court records, and the New York Times, the Merck-sponsored publication for doctors in Australia came to light during litigation

over Vioxx-a pain medication that caused, conservatively, more than 27,785 deaths according to the U.S. Food and Drug Administration (FDA).

The Lancet editor blamed the FDA for faulty oversight for the VIOXX killings, but failed to cite his own parent company's complicity in the iatrogenocide. Dr. Horton wrote, "Without more vigilant drug regulation in the future, doctors will continue to be misled and patients' lives will continue to be endangered. "

So with zero confidence in The Lancet, Dr. Horton, those paying his salary, and those criticizing him for his actions, Medical Veritas editors are inviting Dr. Wakefield to re-publish his controversial paper in their next issue.

"Many of our editors have experienced slander and demeaning remarks by mainstream healthcare authorities and the media, Dr. Gary S. Goldman, the Associate Editor of Medical Veritas, wrote to Dr. Wakefield. "Your numerous peer-reviewed journal articles testify to your valuable contribution to the medical and health fields, and your stand against the opponents to scientific reason and common sense is heroic."

Medical Veritas, wherein Dr. Wakefield published a 2006 follow-up study to his 1998 report in The Lancet, is "one of the few remaining journals that places emphasis on the health interests of individuals rather than pursue profits."

"The current climate of vaccine science is very controversial," said Eileen Dannemann. In recent months, the Director of the National Coalition of Organized Women collected and analyzed data of spontaneous abortions following injections of H1N1 vaccines into pregnant women.

"The information that people are given by vaccine authorities, and through the media," Dannemann insists, "is inconsistent with the safety studies conducted that lack placebo controls and long-term surveillance of adverse reactions to these vaccinations."

Contrary to the PharmaMedia's propaganda character-assassinating Dr. Wakefield, he is not the only scientist concerned about vaccinations causing deadly side effects. In recent days, a new study from The Center for Modeling Optimal Outcomes in New Jersey published, "If it hadn't been for so many parents insisting that vaccines were responsible for the condition [of autism], we might never have found the fact that the stabilizer in MMR, and a few other vaccines, is hydrolyzed gelatin--a substance that is approximately 21% glycine. It appears that, based on readily verifiable science, the use of that form of glycine triggers an imbalance between the amino acid neurotransmitters responsible for the absorption rate of certain classes of cells throughout the body. It is that wide-spread disruption that apparently results in the systemic problems that encompass the mind and the body characterized in today's 'classic' autism."

Note To Journalists

There is a courtesy copy of Medical Veritas, available free for online review for only 2 more weeks: CLICK HERE for Dr. Horowitz's commentary and link to "PHARMAGANDA: A Study of Conflicting Interests."

After February 15, 2010, there will be a $35 charge for accessing the Medical Veritas journal via pdf downloads, with individual articles in this issue available for separate purchase at $15 per download, including Dr. Harold Buttram's important article on the future of human DNA corrupted by the mutagenic viral injections accompanying childhood vaccinations.

Please help alert medical doctors about this report, and this free limited time access. Medical doctors and patients must be informed that their intelligence has been tainted by pharmaceutical special interests. This publication contains urgent life-saving knowledge.

Anti-Vaccination Groups Dealt Blow as Lancet Study is Retracted

Popular Mechanics, 5 February 2010
https://web.archive.org/web/20100218110930/http://www.popularmechanics.com/science/health_medicine/4344963.html?nav=RSS20&src=syn&dom=yah_buzz&mag=pop

A 1998 study in *The Lancet* medical journal that largely launched the dangerous anti-vaccination movement has been officially retracted. Here are the details on the ethical and scientific missteps that eventually lead to the editors pulling this study. =>
https://web.archive.org/web/20100214204019/http://www.popularmechanics.com/science/health_medicine/4273262.html

In what will likely be a big blow to the anti-vaccination movement, *The Lancet* medical journal has retracted the 1998 study by Dr. Andrew Wakefield that originally sparked the uproar over whether vaccines are linked to autism.

The move by editors of *The Lancet* on Tuesday came after the General Medical Council – Britain's independent regulator for doctors—admonished Wakefield and two of his co-authors last week for acting irresponsibly and unethically in the course of the research. The Council found that Wakefield subjected children to invasive procedures such as colonoscopies for pure experimentation rather than clinical purposes and without ethics board approval. Wakefield even obtained blood samples from kids at his son's birthday party for five pounds (about $8) apiece. Money was perhaps not much of an issue for Wakefield, however: He allegedly pocketed around $800,000 from a law firm involved with class-action lawsuits claiming injury from vaccines.

For the now-retracted study, Wakefield and his colleagues found intestinal abnormalities in 12 children, two-thirds of whom parents and physicians say developed autism spectrum disorders and gastrointestinal illnesses right around the time they got pricked with the measles-mumps-rubella (MMR) vaccine. Though the study stopped short of explicitly blaming the MMR vaccine for the GI illness and developmental regressions – instead invoking “possible environmental triggers" – the insinuation was clear. Wakefield amplified the vaccine-disease connection at an alarming press conference given at the time of publication.

Wakefield's poor personal behavior should not eclipse good science. But over the years, the original study has come under intense fire not just on ethical grounds but also on scientific merit. Wakefield and lawyers working on the class-action lawsuits cherry-picked the 12 children, the editor of *The Lancet* told *The Wall Street Journal*, and distorted their case histories. In 2004, in response to this conflict of interest and other issues, 10 of the study's 13 authors formally retracted the section suggesting a time-associated link between the vaccine and onset of autism.

The Fallout

The damage had already been done, however. After the study's publication, a flurry of follow-up research, lawsuits and finger-pointing ensued. Most damaging of all, perhaps, is that many justifiably freaked-out parents opted not to immunize their children. In just five years, the child non-vaccination rate for MMR in the U.S. nearly tripled from 0.77 percent in 1995 to 2.1 percent in 2000. Similarly, in Britain, where *The Lancet* is published, child vaccination rates have dropped by nearly a third

compared to 1990s levels. As a consequence, more children succumbed to diseases once held largely in check by national vaccination programs. In Britain, cases of MMR spiked to two-dozen times the incidence rate in 2008 as in 1998.

The Lancet's retraction has elicited strong reactions from advocates on both sides of the vaccine-autism issue. Amy Pisani, executive director of Every Child By Two, a pro-vaccination organization, thinks the retraction does far too little too late. “I feel that *The Lancet* is culpable in the deaths of children," Pisani says. She also points out that the study diverted attention away from legitimate autism research for years. Rita Shreffler, executive director of the National Autism Association, disagrees, maintaining that vaccines are implicated in autism regardless of *The Lancet*'s action. “The paper that was retracted does not say MMR causes autism," she says.

Less controversial is evidence of a surge of autism cases in recent decades. According to the Centers for Disease Control and Prevention (CDC), the prevalence for autism in the U.S. is now one in 110 children; two decades ago that figure was one in 10,000. Heightened awareness and the ability to better diagnose autism certainly explains some of the increase, but doubts linger as to whether that can account for all of it. Genetic susceptibility no doubt plays a role, and some fear that environmental problems such as contaminated water supplies may also be responsible.

Regardless, the overwhelming scientific consensus in the literature – endorsed by the independent, non-governmental Institute of Medicine, the CDC and other governmental organizations in the U.S. and abroad – is that vaccines are not the cause of autism. For example, a paper published last year in *Clinical Infectious Diseases*, which reviewed 20 studies on the subject, refuted the main “scientific" pillars of the anti-vaccination movement one-by-one.

THE FLU CASE

Dr Carley Responds to the Statements Highlighted in Red above

The Flu Case, 5 February 2010
https://web.archive.org/web/20100211124323/http://www.theflucase.com/index.php?option=com_content&view=article&id=2696:the-medical-mafia-takes-down-dr-andrew-wakefield-analysis-from-dr-carley&catid=1:latest-news&Itemid=64&lang=en

Re: retracted a controversial study; how can findings be "retracted"?

Wakefield found measles virus in the bowel lymphoid tissue in autistic children. That is why he is being attacked, because this finding shows that the measles vaccine gave the children measles, which could not be eliminated due to the corruption of the immune system explained in "Inoculations the True WMD" and "Dr Carley's Responce to the CDC" on www.drcarley.com, which occurs when viruses are injected into the bloodstream.

Re: "*British surgeon" and "Wakefield took blood samples from children at his son's birthday party", Wakefield is a gastroenterologist, not a surgeon. He found the measles virus in the lymphoid tissue in the guts of autistic children during endoscopies, which were obviously not performed at a birthday party.*

Re: "*Subsequent studies have found no proof that the vaccine is connected to autism", who sponsored those studies? BIG PHARMA; in fact, such conflicts of interest are the NORM in medical journals...*

Noble JH Jr. **Drug firm conflicting interests. Radical change, not tweaking, is needed**. BMJ. 2009 Dec 31;339:b5656. doi: 10.1136/bmj.b5656. https://pubmed.ncbi.nlm.nih.gov/20044405/

Radical change, not tweaking, is needed

Lawton makes the case against major reform of the way the pharmaceutical and medical device industry currently does business against Goldacre's call for the conduct of clinical trials by disinterested third parties to offset the inherent biases of industry sponsored clinical trials.[1 2] He dismisses Goldacre's argument that the commercial interests of the industry produce biased evidence that misleads doctors and thereby increases patient morbidity and mortality. Instead, Lawton urges tweaking of the current system to improve its functioning, putting forth several threadbare arguments about the productivity of industry research and efficacy of government regulation and quality control oversight.

Lawton makes the case against major reform of the way the pharmaceutical and medical device industry currently does business against Goldacre's call for the conduct of clinical trials by

disinterested third parties to offset the inherent biases of industry sponsored clinical trials.[1,2] He dismisses Goldacre's argument that the commercial interests of the industry produce biased evidence that misleads doctors and thereby increases patient morbidity and mortality. Instead, Lawton urges tweaking of the current system to improve its functioning, putting forth several threadbare arguments about the productivity of industry research and efficacy of government regulation and quality control oversight.

Fisher provides a revealing view of what goes on in the offices of doctors who receive funding from industry to conduct research on their patients and its biasing effects.[3]

The political momentum in the United States seems to be building for broader reforms in view of the extent of conflicts of interest reported by the US Health and Human Services Office of the Attorney General among grant recipients of the National Institutes of Health and the staff themselves.[4,5]

If society is really serious about improving the public health through the production of valid and reliable science for use by doctors on behalf of their patients, Lawton's recommendation for tweaking the current system to achieve marginal improvements should be rejected. The weight of evidence points to the need for radical change, not tweaking.

Re: "*he had brought the medical profession "into disrepute.", that is what this is really about. Any doctor who exposes the fraud within the medical mafia is attacked; especially when MediSIN's sacred cow, vaccines, is involved.*

On the 2nd hour of "What's Ailing America?" this Saturday, you will hear from Dr Edward Spencer (who has been a guest on my show re: Morgellon's). He had the audacity to write a letter to doctors at the hospital he works at in CA re: the danger of the H1N1 vaccine, and now they are demanding he undergo a psychiatric exam (just as happened to me for doing a public access TV show about the cover-up of my son's sexual abuse by authorities). Not until the people stand up for doctors of conscience who are being persecuted for telling the truth will anything change. Otherwise, your only choice will be the anti-hippocratics (Medical Masons), who will kill you without batting an eyelash. Silence is consent to the murder by mediSIN of your loved ones.

Re "the majority of co-authors on the paper retracted their support for the claims of a possible link between the vaccine and colitis or autism", *obviously* these individuals were threatened; and rather than stand their ground, they got down on their knees and licked the boots of their medical mafia masters.

I met Dr Wakefield around 1999/2000, where we both lectured at an autism conference. He heard my info, that autism is due to demyelination caused by anti-measles antibodies; in fact, *autism is actually subacute sclerosing panencephalitis caused by the measles vaccine*; *they changed the name to autism to hide this fact*.

Dr Wakefield has had more attention in the autism community because he was able to get this now retracted article published in a medical journal; my work will never be published in a mainstream journal as it addresses the true cause of autism. Measles virus is not just in the gut lymph tissue, it is in the brain, where it causes vaccine induced encephalitis. The anti measles antibody created against the measles virus causes demyelination as it attacks the myelin sheath, since myelin basic protein is very similar to measles virus. Note that the MMR vaccine has NEVER had thimerosol (mercury) in it; so it is very interesting that many "mercury causes autism" disinfo groups are backing him.

As the few real doctors (those with a conscience) are picked off one by one, eventually all that will be left will be the MD's (medical devils). In fact, I am working on what will be my first book on how medical devils are created, sharing some of the things I experienced in medical school and residency, which will hopefully be done by the end of this month. Sleep deprivation and rewarding of bad acts are at the root of it, and it is getting worse every year. If young doctors see that no good deed goes unpunished (and that patients allow good doctors to be destroyed), they will all learn to lick the boots of their medical mafia masters, just as Wakefield's cowardly co-authors did.

Summary

Background We investigated a consecutive series of children with chronic enterocolitis and regressive developmental disorder.

Methods 12 children (mean age 6 years [range 3–10], 11 boys) were referred to a paediatric gastroenterology unit with a history of normal development followed by loss of acquired skills, including language, together with diarrhoea and abdominal pain. Children underwent gastroenterological, neurological, and developmental assessment and review of developmental records. Ileocolonoscopy and biopsy sampling, magnetic-resonance imaging (MRI), electroencephalography (EEG), and lumbar puncture were done under sedation. Barium follow-through radiography was done where possible. Biochemical, haematological, and immunological profiles were examined.

Findings Onset of behavioural symptoms was associated by the parents, with measles, mumps, and rubella vaccination in eight of the 12 children, with measles infection in one child, and otitis media in another. All 12 children had intestinal abnormalities ranging from lymphoid nodular hyperplasia to aphthoid ulceration. Histology showed patchy chronic inflammation in 11 children and reactive ileal lymphonodular hyperplasia in seven, but no granulomas. Behavioural disorders included autism (nine), disintegrative psychosis (one), and possible postviral or vaccinal encephalitis (two). There were no focal neurological abnormalities and MRI and EEG tests were normal. Abnormal laboratory results were significantly raised urinary methylmalonic acid compared with age-matched controls ($p=0.003$), low haemoglobin in four children, and a low serum IgA in four children.

Interpretation We identified associated gastrointestinal disease and developmental regression in a group of previously normal children, which was generally associated in time with possible environmental triggers.

Correspondence to: Dr A J Wakefield

Introduction

We saw several children who, after a period of apparent normality, lost acquired skills, including communication. They all had gastrointestinal symptoms, including abdominal pain, diarrhoea, and bloating and, in some cases, food intolerance. We describe the clinical findings, and gastrointestinal features of these children.

Patients and methods

12 children, consecutively referred to the department of paediatric gastroenterology with a history of a pervasive developmental disorder with loss of acquired skills and intestinal symptoms (diarrhoea, abdominal pain, bloating and food intolerance), were investigated. All children were admitted to the ward for a week, accompanied by their parents.

Clinical investigations

We took history including details of immunisations and exposure to infectious diseases, and assessed the children. In 11 cases the history was obtained by the senior clinician (JW-S). Neurological and psychiatric assessments were done by consultant staff (PH, MB) with HMS-4 criteria.[1] Developmental data included a review of prospective developmental records from parents, health visitors, and general practitioners. Four children did not undergo psychiatric assessment in hospital; all had been assessed professionally elsewhere, so these assessments were used as the basis for their behavioural diagnosis.

After bowel preparation, ileocolonoscopy was performed by SHM or MAT under sedation with midazolam and pethidine. Paired frozen and formalin-fixed mucosal biopsy samples were taken from the terminal ileum; ascending, transverse, descending, and sigmoid colons, and from the rectum. The procedure was recorded by video or still images, and were compared with images of the previous seven consecutive paediatric colonoscopies (four normal colonoscopies and three on children with ulcerative colitis), in which the physician reported normal appearances in the terminal ileum. Barium follow-through radiography was possible in some cases.

Also under sedation, cerebral magnetic-resonance imaging (MRI), electroencephalography (EEG) including visual, brain stem auditory, and sensory evoked potentials (where compliance made these possible), and lumbar puncture were done.

Laboratory investigations

Thyroid function, serum long-chain fatty acids, and cerebrospinal-fluid lactate were measured to exclude known causes of childhood neurodegenerative disease. Urinary methylmalonic acid was measured in random urine samples from eight of the 12 children and 14 age-matched and sex-matched normal controls, by a modification of a technique described previously.[2] Chromatograms were scanned digitally on computer, to analyse the methylmalonic-acid zones from cases and controls. Urinary methylmalonic-acid concentrations in patients and controls were compared by a two-sample *t* test. Urinary creatinine was estimated by routine spectrophotometric assay.

Children were screened for antiendomyseal antibodies and boys were screened for fragile-X if this had not been done

RETRACTED

CHILD HEALTH SAFETY

British & Japanese data show Vaccines cause Autism

Child Health Safety, 8 February 2010
http://childhealthsafety.wordpress.com/2010/02/08/britvaxautism/

We previously published data from Japan showing a clear causal link between changes in the Japanese vaccination schedules and corresponding increases and decreases in rates of children having autistic conditions: Japanese Data Show Vaccines Cause Autism. The UK's Joint Committee on Vaccination and Immunisation's irresponsible and only answer to the Japanese data was it was "not UK data".

=> https://web.archive.org/web/20121117201432/http://childhealthsafety.wordpress.com/2009/06/03/japvaxautism/

Data from the UK's General Practice Research Database shows that with each major change in the UK childhood vaccination programme the rates of childhood autism have increased significantly.

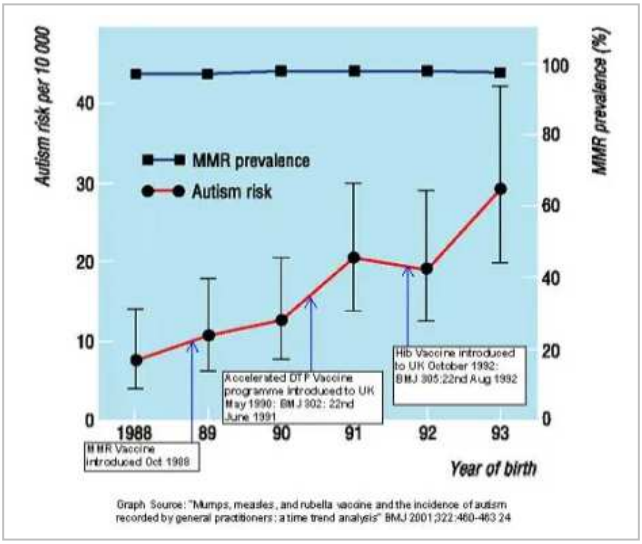
And do vaccines cause autistic conditions? If you read nothing else we strongly recommend you read this: PDF Download – Text of May 5th 2008 email from US HRSA to Sharyl Attkisson of CBS News]. In it the US Health Resources Services Administration [HRSA] state to CBS News reporter Sharyl Attkisson

We have compensated cases in which children exhibited an encephalopathy, or general brain disease. Encephalopathy may be accompanied by a medical progression of an array of symptoms including autistic behavior, autism, or seizures."

Despite all the lies and deceit by health official worldwide, the question "do vaccines cause autism" was answered after the Hannah Poling story broke in the USA in February 2008. => https://childhealthsafety.wordpress.com/2009/01/13/secret-british-mmr-vaccine-files-forced-open-by-legal-action/#US_Developments

Hannah developed an autistic condition after 9 vaccines administered the same day. Under the media spotlight numerous US health officials and agencies conceded on broadcast US nationwide TV news from CBS and CNN. Full details with links to the original sources can be found in this CHS article: Vaccination Causes Autism – Say US Government & Merck's Director of Vaccines. – 30 June 2010

https://childhealthsafety.wordpress.com/2010/06/30/vaccination-causes-autism-%e2%80%93-say-us-government-merck%e2%80%99s-director-of%c2%a0vaccines/



Autism risk per 10 000
MMR prevalence (%)
MMR prevalence
Autism risk
Accelerated DTP Vaccine programme introduced to UK May 1990: BMJ 302: 22nd June 1991
Hib Vaccine introduced to UK October 1992: BMJ 305:22nd Aug 1992
MMR Vaccine introduced Oct 1988
Year of birth
Graph Source: "Mumps, measles, and rubella vaccine and the incidence of autism recorded by general practitioners: a time trend analysis" BMJ 2001;322:460-463 24

The current UK rate of children with autistic conditions is 1 in 64 [or 157 per 10,000 children]: "Prevalence of autism-spectrum conditions: UK school-based population study" Baron-Cohen S, Scott FJ, Allison C, Williams J, Bolton P, Matthews FE and Brayne C (2009) British Journal of Psychiatry, 194: 500-509.

The rate in boys is 1 in 40. Prior to 1988 which saw the first of several major changes to the UK childhood vaccination programmes the rate of childhood autism was running at between 1 and 4 in 10,000. Childhood autism is also known as "typical" or "Kanner" autism.

In addition to vaccines being a biologically plausible cause of the worldwide increases in autistic conditions in children we have also seen legal cases in the USA confirming vaccines have caused autism in US children: AUTISM – US Court Decisions and Other Recent Developments – It's Not Just MMR

The data presented here provides further evidence of the unscientific approach of medical researchers when publishing papers purporting to support the claim there is no association between vaccines and autism.

The graph above is adapted from a 2001 paper by Jick et al. The authors claimed:
"*... the data provide evidence that no correlation exists between the prevalence of MMR vaccination and the rapid increase in the risk of autism over time. The explanation for the marked increase in risk of the diagnosis of autism in the past decade remains uncertain. ..... The increase ..... could be due to ..... environmental factors not yet identified.*"

"Mumps, measles, and rubella vaccine and the incidence of autism recorded by general practitioners: a time trend analysis" BMJ 2001;322:460-463 24 February.

The data shows something different and when correlated with major changes in the UK childhood vaccination programme shows what are the most likely "environmental factors not yet identified". With each major change to the UK's childhood vaccination programme cases of childhood autism increased substantially.

The childhood autism risk increased three-fold for children born in 1988 and 1989 from the previous rate of between 1 and 4 in 10,000 to 12 in 10,000.

The major change: the MMR vaccine was introduced in October 1988. Routine administration was at around 15 months.

The childhood autism risk increased five-fold for children born in 1990 and 1991 to 20 in 10,000 from the pre 1988 rate of 1 to 4 in 10,000.

The major change: in May 1990 the accelerated DTP vaccine programme was introduced. British babies were given the DTP vaccine substantially earlier at 2, 3 and 4 months instead of the previous 3, 5 and 10 months.

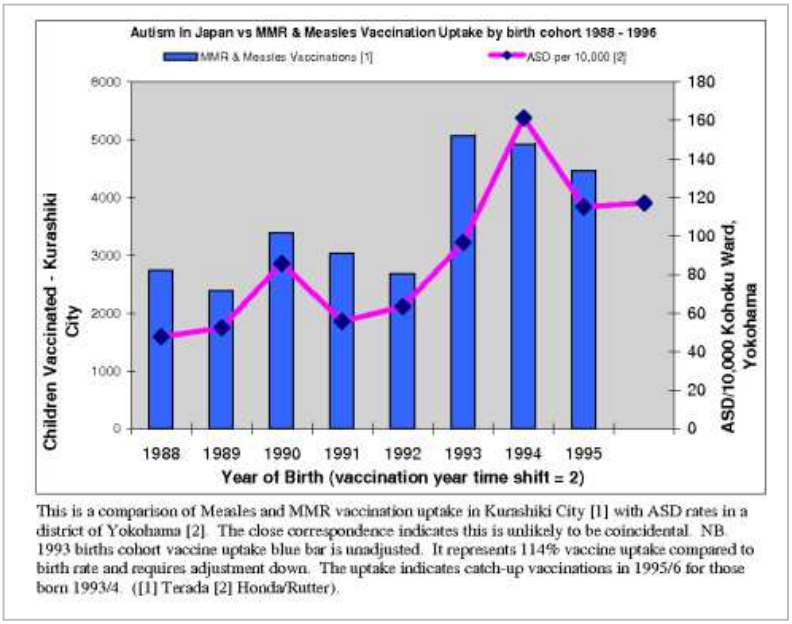
The childhood autism risk increased nearly eight-fold for children born in 1993 to 29 in 10,000 from the pre 1988 rate of 1 to 4 in 10,000.

The major change: the Haemophilus Influenzae b vaccine was introduced in October 1992. Routine administration was three doses at 2, 3 and 4 months.

It appears it was only from 1993 that most infants were vaccinated at 2, 3 and 4 months with those born earlier being vaccinated at later ages in "catch-up campaigns". This data suggests that to reduce the risk of autism from vaccines parents should delay the age at which their children are vaccinated.

One study shows that average vaccine coverage by November 1993 was 34% for 1989 births, 77% for 1990 births, 87% for 1991 births, and 89% for 1992 births: "Haemophilus influenzae: the efficiency of reporting invasive disease in England and Wales" Communicable Disease Report 4:2 4 February 1994.

Data from formal peer refereed medical papers show vaccines caused autism in Japanese children. The number developing autism rose and fell in direct proportion to the number of children vaccinated each year: [click here for full details Japanese Data Show Vaccines Cause Autism]



This is a comparison of Measles and MMR vaccination uptake in Kurashiki City [1] with ASD rates in a district of Yokohama [2]. The close correspondence indicates this is unlikely to be coincidental. NB. 1993 births cohort vaccine uptake blue bar is unadjusted. It represents 114% vaccine uptake compared to birth rate and requires adjustment down. The uptake indicates catch-up vaccinations in 1995/6 for those born 1993/4. ([1] Terada [2] Honda/Rutter).

https://www.information.dk/indland/2010/02/forsker-mistaenkes-forfalske-millionbevillinger

En forsvunden forskningschef er under mistanke for at have bedraget Aarhus Universitet. Han tjente efter alt at dømme millioner på at forfalske amerikanske bevillinger.

Sidste år opsagde en mid- aldrende forskningsleder på Aarhus Universitet sin stilling midt i et større projekt. Opsigelsen skete i god ro og orden, men det skulle vise sig, at forskeren efterlod sig falske millionbevillinger, der har efterladt et stort hul i kasserne på Aarhus Universitet.

Projektet, der blandt andet skulle afdække årsagen til autisme, var et samarbejde mellem Odense Universitets- hospital og Aarhus Universitet og finansieret af den amerikanske pendant til Sundhedsstyrelsen, Center for Disease Control (CDC), der har bidraget med 80 mio. kr.

Men det beløb var tilsyneladende ikke nok for den midaldrende projektleder. Ifølge Informations oplysninger mistænkes han for at have forfalsket to bevillingsgodkendelser samt et brev fra CDC. De falske dokumenter skulle godtgøre, at flere penge var fra på vej fra USA - Aarhus Universitet stolede på deres forsker og lagde pengene ud. Ifølge Århus Stiftstidende er der tale om et beløb på omkring 10 millioner kr.

Hos Østjyllands Politi er man i færd med at samle materiale nok til at rejse en sigtelse mod forskeren, der efter sigende opholder sig i USA.

Hevet penge ud

Forsknings- og Innovationsstyrelsen forvaltede de amerikanske midler, og ifølge juridisk chefkonsulent Charlotte Elverdam afslørede regnskaberne, at der var »ting, der ikke passede sammen«:

»Nogen har tilsyneladende givet Aarhus Universitet indtryk af, at der var flere penge i projektet, end der reelt var,« siger hun og understreger, at Forsknings- og Innovationsstyrelsen ikke har uddelt flere penge, end der er kommet ind fra amerikansk side. Siden forsøgte styrelsen at finde en forklaring på, hvad der var sket:

»Man kunne få den tanke, at der er nogen, der har hevet penge ud af projektet, så vi talte med de involverede parter for at finde ud af, hvordan det hang sammen. Efter drøftelser med Aarhus Universitet valgte vi at overdrage sagen til politiet,« siger Charlotte Elverdam.

Den anmeldelse modtog Københavns Politi allerede sidste år, men gav den efterfølgende videre til Østjyllands Politi, som fortsat venter på materiale i sagen.

Ifølge politiinspektør Børge Frandsen arbejder man ud fra tesen om dokumentfalsk, men har endnu ikke nok til at rejse sigtelse. Han peger på, at det er imod de amerikanske regler at udbetale penge direkte til et universitet eller en enkelt person – derfor er midlerne fra CDC gået igennem Forskningsministeriet og altså Forsknings- og Innovationsstyrelsen.

»Man mener, der er foregået uregelmæssigheder med falske og konstruerede dokumenter. Det indgår i vores efterforskning, der også skal fastslå beløbets størrelse, samt hvilke procedurer og kontrolinstanser, der indgår i sagen,« siger Børge Frandsen.

Politiet arbejder på at finde grundlaget for en sigtelse, og politiinspektøren vil ikke afvise, at det også kan omfatte undersøgelser i USA.

Der er ikke flere penge

På Aarhus Universitet sidder man foreløbig tilbage med et betydeligt hul i kassen. Tilliden til forskeren skulle vise sig at koste dyrt:

»Da vi forsøgte at få pengene ind via Odense Universitetshospital og Forsknings- og Innovationsstyrelsen, fik vi at vide, at der ikke var flere penge i det projekt. Det kunne vi ikke forstå, for vi havde jo bevillingstilkendegivelser,« forklarer pressechef for rektoratet på universitetet, Anders Correll.

Da man siden kontaktede hovedaktøren, CDC i USA, lød beskeden, at man ikke kendte til de pågældende bevillingstilkendegivelser, og at de underskrifter, der var på dokumenterne, var falske.

Det skulle også vise sig, at den mistænkte forsker, der står bag en lang række videnskabelige artikler om årsagerne til autisme og konsekvenserne af gravide kvinders livsstil, havde en dobbeltansættelse. Ved siden af sin karriere i Århus var han lønnet ansat ved et amerikansk universitet.

Information har forgæves forsøgt at træffe forskeren, men hans danske telefonnummer er tilsyneladende nedlagt.

Mette Klingsey, Kristian Villesen

Forgery at Danish University Jeopardises Autism study, reports

Information // The Flu Case, 3 March 2010
https://web.archive.org/web/20100305090842/http://www.theflucase.com/index.php?option=com_content&view=article&id=2890%3Aforgery-at-danish-university-jeopardises-autism-study-reports-information&catid=1%3Alatest-news&Itemid=64&lang=en

A lead researcher who has disappeared is suspected of having deceived the university of Aarhus in Denmark. It seems, he earned millions by falsifying American research grants, writes Danish daily newspaper Information.

Last year a middle-aged lead researcher at Aarhus University resigned from his job in the middle of a large research project. The resignation took place very quietly, but later on it became clear, that the scientist left behind falsified grants worth millions, which has now resulted in a significant deficit in the budgets at the University of Aarhus.

The project, which among other things should reveal the cause of autism, was a collaboration between the University Hospital of Odense (in Denmark) and the University of Aarhus, financed by Center for Disease Control (CDC) which is the American counterpart to danish board of health. The CDC contributed 80 million Danish crowns.

But that amount was apparently not enough for the middle-aged project leader. According to data collected by Informatio, he is suspected of having falsified two confirmations of research grants and a letter from CDC. The false documents appeared to confirm that more money was on its way from the USA: Aarhus University trusted their scientist and payed in advance. According to the danish daily newspaper Aarhus Stiftstidende, the amount of money involved is about 10 millions of Danish crowns.

The police of eastern Jylland is currently collecting the necessary material needed to charge the suspect, who is said to be in the USA.

Took money out

The Danish Board of Research and Innovation administered the American funds, and according to the chief legal advisor, Charlotte Elverdam, the accounts revealed that there were “things which didn’t fit together”:

“Somebody has evidently given Aarhus University the impression that there was more money in the project than there was in reality”, she says and underlines that the board of science and innovation hasn’t distributed more money than the amount coming in from the Americans.

Afterwards the board tried to find an explanation of what had happened:

"One got the impression, that somebody had drawn money out of the project, so we spoke to the partners involved in order to find out what was going on. After discussions with the University of Aarhus we decided to hand over the case to the police" says Charlotte Elverdam.

The police of Copenhagen received the case earlier last year, but later on the case was given to the police of Eastern Jylland. there they are still awaiting documents of the case.

According to Police Inspector Boerge Frandsen, the police work with a thesis of forgery, but it still doesn't have enough material for the suspect to be charged. He points to the fact, that it is against the American rules to pay money directly to a university or to an individual – therefore the funds from the CDC had gone through the Ministry of Science and accordingly the Board of Science and Innovation.

"It is suspected, that irregularities with false and constructed documents has taken place. This is part of our investigation, which is also going to establish how much money is involved, and furthermore what procedurers and levels of control there are in the case," says Boerge Frandsen.

The police are looking for the basis for making a charge, and the police inspector admits that maybe investigations in the USA may also be a possibility.

There is no more money

At the University of Aarhus they are left with a considerable deficit in the budget. The confiding in the scientist has proved to be expensive.

"When we tried to get the money via the University Hospital of Odense and the Board of Science and Innovation, we were told, that there was no more money in the project. This we could not understand, as we had the confirmations of the research grants," explains press spokesman for the university rector, Anders Correll.

When they later on contacted the main actor, CDC, in the USA, it was reported that they did not know the research grant confirmations in question, and that the signatures on the documents were false.

It also emerged the suspected scientist, who is behind a long line of scientific articles about the reasons of autism and the implications for the lifestyle of pregnant women, was doubly employed. Apart from his career at Aarhus he was a payed employee at an American university.

Information has unsuccessfully tried to get in contact with the scientist, but his Danish phone number is apparently disconnected.

Sherri Tenpenny

Wakefield Inquisitioners have their Day

News With Views, 14 February 2010
https://newswithviews.com/Tenpenny/sherri127.htm

I've been asked many times over the last few weeks to share my opinion on the verdict of the U.K's General Medical Council (GMC) about Dr. Andrew Wakefield and the retraction of his 1998 article, "Ileal-lymphoid-nodular hyperplasia, non-specific colitis, and pervasive developmental disorder in children" by the medical journal, Lancet. The many inquiries fall into four basic questions, answered below.

***Question* #1:**
What do you know about Dr. Wakefield's 1998 paper? Do you feel the response of the GMC was appropriate?

Answers:
1. Dr. Wakefield's paper was SIMPLY a case study of 12 children. Hundreds of case reports are published each year in the medical journals….and are essentially ignored. He didn't make *any claims* in his original paper that has gotten all the attention.
2. His original paper was simply a *hypothesis*, not a *claim*, of the connection to Autism. Be sure to read the original paper; it's only 5 pages long. [1]
3. Wakefield published 32 peer-reviewed papers since 1998. NONE of these were mentioned or retracted. [2]
4. Wakefield's most recent research incriminates the use of hepatitis B vaccines in newborns. The first phase of this monkey study was published three months ago in the journal *Neurotoxicology*, focused on the first two weeks of life. Baby monkeys received a single vaccine for Hepatitis B, mimicking the U.S. vaccine schedule, and were compared with matched, unvaccinated monkeys. The vaccinated monkeys, unlike their unvaccinated peers, *suffered the loss of many reflexes that are critical for survival*. Discrediting Wakefield's work over a perceived "ethical" issue would serve to discredit this new research, protecting the vaccine industry once again. [3]
5. Dr. Wakefield's research was never questioned by the GMC. The ruling focused on what was called "unethical behavior" – drawing blood at a children's party, even though the parent's who were present had given their fully informed consent. In fact, in an open letter to the Lancet, the parents of the 12 children in the study rebuke the GMC, politely calling them liars.
6. Dr. Wakefield has never been "anti-vaccine." His work has always been focused on finding an explanation for WHY so many autistic children have terrible bowel disease.
7. Dr. Wakefield has always recommended single antigen vaccines. He hypothesized that the three live viruses given together in the MMR vaccine are the source of potential problems in *at least SOME children*.

Question #2:
Do you have concerns over Dr. Wakefield's failure to disclose financial links to a malpractice attorney and to patents he was working on to develop a single vaccine solution?

***Answers*:** I was rather surprised at the question and my response is, no. I don't feel one bit concerned about that particular issue. I'm not even sure the accusation is 100 percent true; it could be simply a pharma spin/smear. There is so much impropriety among the Players in the vaccine business that any singular accusation about Dr. Wakefield's work toward developing a single-antigen vaccine to make things safer for children TRULY amounts to "the pot calling the kettle black."

Consider this: 1. Dr. Paul Offit, who sat on the Advisory Committee of Immunization Practices (ACIP) committee, the committee who approves all the vaccines given to children and adults, holds the patent for the Rotavirus vaccine, (the one that was withdrawn) AND a patent on the current Rotavirus vaccine which is known to cause pneumonia and still some cases of intussusception. It is rumored that he made millions on his vaccine patent and that big pharma bought all his books, so he could make millions more.

2. Dr. Sam Katz sat for *year* on the ACIP committee having been the developer of the MMR vaccine (particularly the attenuated measles vaccine). He simultaneously consulted with *all* of the vaccine manufacturers.

3. Dr. D.A. Henderson, credited with smallpox vaccine eradication, consulted simultaneously with *all* the vaccine manufacturers for year.

4. Dr. Julie Gerberding, after serving eight years as head of the CDC, was recently named President of Merck vaccines. This is one of the most visible and blatant examples of a gross conflict of interest. Just barely past the 365 day mandatory "wait time" imposed on persons who pass from public service into private sector jobs, she was welcomed with open arms. Does anyone think she *just might* have insider information to share with her new boss, and not just about vaccines?

Question #3:
Do you think the Lancet was justified in pulling the paper for pure scientific reasons?

Answer: It was inappropriate for the Lancet to retract his 1998 paper. What did it prove? By focusing on this paper with such fanfare, the general public has been *lead to believe* that Wakefield's 1998 Lancet paper, a case report, was the ONLY paper and the ONLY research Wakefield has ever done. They sure paint it that way, don't they?

• NOT ONE mainstream reporter mentioned the 32 research papers published in peer-reviewed journals since 1998.
• NOT ONE mainstream reporter interviewed Wakefield for "balanced reporting." What does that say about the story...and the bought-and-owned, generally *lazy* press?
• and NOT ONE mainstream reporter dared to report that Wakefield's observation, finding vaccine-strain measles in the gut of *some* autistic children, has been replicated by other researchers.[4] [5]
• NO ONE has been told about the science that has been published supporting a connection between vaccines and autism and other disorders, and yet the list grows every day. Researchers studying vaccine-related illness have a hard task; their research is not funded by drug companies. The drug companies and the government don't want to know the answers.

It is the same reason the CDC refuses do a study of vaccinated vs. unvaccinated kids, examining something solidly objective like number of drugs they are on, number of days of school missed due to illness and number of doctor visits between birth and 5 years of age for ear infections and asthma.

This "issue" with Dr. Wakefield is a pharma-driven, media-manipulated power move, meant to embarrass Wakefield so they can negate and call into question his new, incriminating research on the hepatitis B vaccine given at birth. No doubt this "media frenzied heyday" has been orchestrated to squash the efforts of the massively growing, Vaccine Choice/Vaccine Awareness movement. The one-sided accusations in magazines and blogs rambling on about the story even call the retraction, "a blow to the anti-vaccine movement."

Here's a common example: Just look at the title. This was published in Popular Mechanics (a vaccine story in Popular Mechanics?) [6]

At the end of the day, *isn't that the point of all this rhetoric?* The truth about vaccine damage is gaining too much attention. The masses are listening and questioning because they are (rightfully) suspicious of government and they don't trust CDC, AAP, etc. Vaccination rates are falling, parents are rebelling. They know that something is amiss as they watch their children get sick, and even die, right before their eyes.

Question #4:
Are you simply a blinded, "Dr. Andy Groupie"?

Answer: No, I am not. I clearly understand the reason *why* this has happened. Could he have done things better? Probably. Could he have been more forthcoming about certain events that he has been accused of? Of course.

But consider other scandals that have emerged in the scientific world, such as research that was published using fake stem-cell lines. These studies used fabricated data and were published in prestigious journals. Has anyone heard Hwang Woo-Suk or Jan Hendrik Schön? Those were the researchers; they were not publicly crucified by the media.

I suspect that if *any* researcher's methods, associations and data were scrutinized with a fine tooth comb like they have done for 12 YEARS with Dr. Wakefield, the Lancet would be forced to retract many articles – maybe all of them. Looking at the Big Picture, one *has to see* that the issue with Dr. Andrew Wakefield is a witch hunt with an agenda. When the twisted associations of those who have been out to crucify Dr. Wakefield are mapped out, it is plain that he had not a chance of exoneration. [7]

The Results of the Vaccine-Illness Connection

We have exchanged chicken pox for autism, flu for asthma, ear infections for diabetes...and the list goes on and on. In the zeal to eliminate relatively benign microbes, we have traded temporary illnesses for pervasive, life-long diseases, disorders, dysfunctions and disabilities. And ***all*** of the Powers That Be – doctors, politicians, corporate heads, and government public health officials – refuse to consider these expensive, pervasive diseases could be caused by vaccines.

If we had an epidemic of blindness in 300,000 children, would doctors ignore it and say, "We have no idea why it is happening. Guess we need to train more seeing-eye dogs." But we have an epidemic of sick children losing their brains. Doctors shrug and say, "It must be genetics." This is the best they have to offer, despite scientific confirmation that there is no such thing as a "genetic epidemic."

There are nearly 300,000 sets of parents with sick, autistic children; the lion share of them saw it happen, with their own eyes, and rightfully blame vaccines. These children are ill; and conventional doctors don't even try to address their illnesses. When non-conventional practitioners try to help, they are scoffed, ridiculed and even raided by the Feds. [8]

There is one unifying factor affecting children, from sea to shining sea. It's not genetics; genetics between families are different. It's not environmental exposures; some kids live in the projects, some live in gated communities. It's not food; some kids eat only organic, some eat mostly McDonalds. It's not exercise; some kids are athletes; others are couch potatoes.

What touches almost all children and is the most likely 'smoking gun' for the epidemic of chronic illness and autism across North America (and beyond), are childhood vaccinations.

What is it going to take?

At the end of the day, it is going to take a tragedy in a high profile doctor or politician for the *Vaccine-Illness Connection* (not just autism) to get serious examination. I have a friend in Maine who is a nephrologist. She consults on patients who need dialysis. *Just by asking the question*, "When was your last vaccine?" she has found nine patients – most with previously normal kidney function – who developed acute renal failure within two to 28 days of the shot. All but one needed

kidney dialysis. All but two have recovered, but to the tune of more than $200,000 in hospital bills – *EACH*. We pay and pay and pay for vaccines.

We pay drug companies to make them. We pay doctors and public health officials to give them. We pay astronomical health insurance rates to cover the health care costs of the illnesses they cause. Vaccines drive the industry – if only we were *willing* to look. WHAT other connections are we missing because we don't want to know?

How conventional medicine can deny this is the real travesty. The Vaccine Court (Federal Court of Claims) has awarded at least nine judgments in favor of children who have become autistic or have had serious damage from MMR vaccine. For heaven's sake, aspirin, antibiotics, and many other drugs can be (and often are) deadly. Why are vaccines *always* considered to be harmless and their side effects *a coincidence?*

Dr. Ignaz Semmelweis was a Hungarian physician who was among the first to perceive that birth-related deaths due to puerperal fever was caused by doctors who didn't wash their hands before childbirth. He dared collect and publish data which admonished his peers and indicted the existing Medical System. Despite various publications that demonstrated hand washing reduced birth mortality below one percent, Semmelweis' practice was ignored by doctors because his observations were in "conflict with established medical opinions." Thousands of children died as a result of the arrogance of doctors and their unwillingness to change.

The tenacity of Semmelweis is a precedent for how Dr. Wakefield has been treated by the GMC in the United Kingdom. Conventionally trained doctors around the world have added thunderous applause, seemingly incapable of questioning the lies they have been forced to swallow and have believed for two centuries about vaccines.

The GMC, the press and the medical establishment have had their Inquisition. But those of us who know the truth are not giving up. Like Semmelweis, our research and evidence will eventually be proven correct. We must continue; the lives – and brains – of the next generation of children are at stake.

VACCINE RESISTANCE MOVEMENT
VRM

Joel Lord

Dr. Andrew Wakefield Being Crucified By Big Pharma

VRM, 16 February 2010
https://web.archive.org/web/20100426101625/http://vaccineresistancemovement.org/?p=329

See what happens to doctors with real integrity who challenge the Medical Mafia? The equivalent of a public lynching.

Dr. Andrew Wakefield, an outspoken critic of vaccines noted for his groundbreaking 1998 study published in British Medical Journal 'The Lancet' linking autism to the Measles, Mumps, Rubella shot has suddenly been rebuked by the same paper.

The timing of this reversal is crucial as more & more parents of vaccine damaged children in Britain & around the world are organizing lawsuits against Big Pharma.

'Following the judgment of the UK General Medical Council's Fitness to Practise Panel on Jan 28, 2010, it has become clear that several elements of the 1998 paper by Wakefield et al1 are incorrect, contrary to the findings of an earlier investigation.2 In particular, the claims in the original paper that children were "consecutively referred" and that investigations were "approved" by the local ethics committee have been proven to be false. Therefore we fully retract this paper from the published record.' => https://www.thelancet.com/journals/lancet/article/PIIS0140-6736(05)77837-5/fulltext

"*I am extremely disappointed by the outcome of today's proceedings*," Wakefield told reporters. "The allegations against me and my colleagues are both unfounded and unjust."

Dr. Wakefield identified the gut/brain correlation in children with Autism all of whom received the MMR vaccine at 12 – 15 months (Inflammatory Bowel Disease a major common denominator). By treating the immunological intolerance of gluten, removing it from the diet, the bowel symptoms got better but also the behavioral symptoms got better. Primary Treatment: 1) Fibre mini Salicylates (plant based anti inflammatory) 2) Gluten Casein free diet (elimination of milk, wheat, rye barley, yeast intake).

This is a very important issue. *Most informed parents are now avoiding* giving their child the MMR shot set, let alone any vaccines on the market. It is therefore vital for the vaccine gurus to get it on record that researchers such as Dr. Wakefield are quacks; to vilify & make scapegoats of these brave doctors who have risked their careers coming out with the truth.
=> https://web.archive.org/web/20100422212108/http://www.npr.org/templates/story/story.php?storyId=125570056

Now they will use this fake scandal to discredit anyone in court who challenges the MMR shot (or links it to Autism in any way). And it will also strengthen any counter to legal challenges by parents of children with Autism resulting from vaccines.

Vaccines are the main cause of Autism, primarily due to the accumulative damage from the Hep B, MMR & DPT shots – multiple live viruses & heavy metal build-up. This leads to Ischemia, a singing of the neural pathways crucial for Oxygen flow to the brain from toxic overload, thus suffocating the neurons.

Further thousands of parents have been wrongly imprisoned for 'Shaken baby Syndrome'. Vaccine trauma was to blame.

Dr. Andrew Wakefield is a hero of families everywhere, of we the people all of whom have somehow been touched by Autism. He is being singled out by a tyrants for speaking the truth against a vicious Medical Hegemony committed to lying & cheating in order to sustain its lucrative Industry of death.

Nothing is more important than our health. We have to protect rebels who fight for our right to safeguard that sacred trust. The only way we will expose Big Pharma is by learning & spreading the truth. When Professionals risk their livelihood to help humanity we owe it to them to defend their honor once they are crucified for sticking their necks out.

Because if we allow this to continue others will think twice before risking it all to save a few lives. What price liberty?

Wakefield's 1998 study demonstrated "anti-myelin antibodies and digestive tract pathologies in children with autism after being given the MMR vaccine." See: Dr. Rebecca Carley.
=> https://web.archive.org/web/20121211173658/http://web.linkny.com/~civitas/CPHArticles/page26.html

Findings: Onset of behavioural symptoms was associated, by the parents, with measles, mumps, and rubella vaccination in eight of the 12 children, with measles infection in one child, and otitis media in another. All 12 children had intestinal abnormalities, ranging from lymphoid nodular hyperplasia to aphthoid ulceration. Histology showed patchy chronic inflammation in the colon in 11 children and reactive ileal lymphoid hyperplasia in seven, but no granulomas. Behavioural disorders included autism (nine), disintegrative psychosis (one), and possible postviral or vaccinal encephalitis (two).

THE FLU CASE

Danish author of key studies showing no link between mercury and autism vanishes after fraud uncovered:

Aarhaus (University) says scientist is Poul Thorsen co-author with K. M. Madsen.

The Flu Case, 4 March 2010 16:44

https://web.archive.org/web/20100513204037/http://www.theflucase.com/index.php?option=com_content&view=article&id=2902%3Adanish-author-of-key-studies-showing-no-link-between-mercury-and-autism-vanishes-after-fraud-uncovered-qvaccine-gateq-scandal-could-reignite-autism-debate&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The lead author of a key study used by EU and USA health bodies as evidence mercury in vaccines does not cause autism has vanished after it emerged that he fraudulently claimed 10 million crowns in funds from his university in Denmark.

According to a statement by the CDC, the researcher is Dr Poul Thorsen, who was also employed by Emory University, Atlanta, without the knowlege of his university, according to the Danish media.

Police, who were called in to investigate by the university after they found a 10-million crown hole in their budget, believe the researcher is in the USA, living and working in Atlanta.

The scientist has worked on a multi-phase research project on the cause of autism that has been received about 80 million crowns in funding from the CDC, headquartered in Atlanta, since 2002.

Poul Thorsen along with Keersten Madsen Meldgaard was the author of a study published in 2002 that used data from Danish children to show that there was no link between mercury in vaccines and autism.

The data in the study called Population-Based Study of Measles, Mumps, and Rubella Vaccination and Autism and published in the New England Journal of Medicine appears to show that autism rates went up after mercury was removed from vaccines, and was used in many subsequent studies justifying the use of mercury.

However, the study has come under criticism for evidence that data has been manipulated to bolster the pro vaccine cause. => Madsen KM, et al. A population-based study of measles, mumps, and rubella vaccination and autism. N Engl J Med. 2002 Nov 7;347(19):1477-82. doi: 10.1056/NEJMoa021134.

The close links and email communication between Kristeen Madsen and CDC researcher Dr. Diane Simpson have come be fiercely criticised for appearing to show that Madsen and Simpson looked for data to suit their theory.https://web.archive.org/web/20100324120858/http://www.putchildrenfirst.org/chapter5.html

The revelation that a key author of key pro thiomersal study has apparently vanished over a case fraud involving the CDC funds is sure to reignite the dispute about the validity of these studies and the dangers of thiomersal.

The CDC, an agency belonging to the US Department of Health and Human Services, has been accused of hiding the relationship between threefold growth of vaccinations for US children in the 1990s and the epidemic of autism and other neurodevelopmental disorders that began at exactly the same time.

Key pro-vaccine studies in The Journal of the American Medical Association, The American Journal of Preventative Medicine and the American Medical Association appearing to show no link between autism and mercury have also been based on the Danish data.

Also, the Danish data was used by a team from the Centers for Disease Control working with colleagues at the University of Aarhaus to link autism to difficult birth and a family history of mental illness in a study from 2005.

The validity of all these studies will also now be called into question.

The fraud involving 10 million crowns raises the issue of whether money flowing to the Danish researcher from the CDC was a reward for manipulating study results.

Swine flu vaccines with thiomersal were administered to millions of people, including babies and children, this autumn as part of the CDC and WHO pandemic management plans in spite of a lack of clinical data.

Ulla Danielson

Two reports from the Danish media translated

Maja Nielsen and Morten Ravn,
1. Swindle for millions at Aarhus University.
The Copenhagen Post, 10 February 2010

A big research project has resulted in a deficit of 10 million crowns in the budget of Aarhus university.

Police are investigating the case as fraud while the university has cut ist links to the chief-investigator from Aarhus, writes Danish Daily Aarhus Stiftstidende.

The Aarhus-based scientist left his job at the medical health faculty in March last year. After a short period, the university began to suspect something was radically wrong. The suspicion increased.

Accordingly the university in collaboration with Board of Science and Innovation reported the case to the police of Eastern Jylland. Among other things the now disputed research project maps out the cause of autism. Since 2002, the project has received more than 80 millions crowns from the American board of health,the CDC. The University of Aarhus is in the process of issuing a declaration to a lot of institutions about the tangled case. In this communication the director of the university, Joergen Joergensen, underlines that the aarhus-scientist no longer is connected with the university.

Researcher employed in more than one place. "At the same time it has become clear that the resigned leader of the research project has been employed doubly. Without the university's knowledge, he has been a payed employee at the University of Emory in the USA while he was still employed in aarhus.

"Of course that is not acceptable," says head of press for the rector at the university, Anders Corell, to Aarhus Stiftstidende. He does not want to say anything about the amount of money the University is missing. Neither will Anders Corell comment on the information provided to the newspaper talking about a fraud involving 10 million crowns.

Police inspector Boerge Frandsen from Eastern Jylland's police confirms, that there is a report. The police has started to investigate the case. "Yes, it is about fraud", the police inspector says to Aarhus Stiftstidende. He is not able to confirm or deny size of the amount of money or the consequences. But so far the disputed chief investigator has not been charged.

On the move in the USA

The newspaper has learnd that the investigations are hampered because it has been very difficult to find the key figure in the case. Aarhus Stiftstidende has also unsuccessfully tried to get a comment from the Aarhus-based scientist, who has his private address in hoejbjerg (outside Aarhus). After he left the medical health faculty in Aarhus he participated, among other things, at a conference in Italy. On that event his papers errorneously said that he was employed by the University of Aarhus.

Aarhus Stiftstidende has spoken to several sources, who say that the scientist, who has a PhD, is at the moment is on the move in USA. They describe him as a Stein Bagger type (a Danish financial fraud) who is eminently clever at raising money from funds.

"He can open the doors to the great money tanks. But all projects all the time had to grow bigger and bigger. He succeeded in raising a huge amount of dollars. Rules however was something that existed for the sake of others – not for him," it has been said, sounding characteristic.

2. Researcher accused of cheating Uni out of millions.

The Copenhagen Post, 11 February 2010, 15:12

A former lead research suspected of fraud now living in US and has not been questioned by police.

Aarhus University has confirmed that a former head of research at its North Atlantic Neuro-Epidemiology Alliances department has committed possible fraud amounting to 10 million kroner against several of the school's research partners, reports Århus Stiftstidende newspaper.

Until last March, the man was head of an 80 million crown joint research project between the US government's Centers for Disease Control and Prevention (CDC), the University of Southern Denmark and Aarhus University.

Jørgen Jørgensen, Aarhus University's rector, confirmed police charges have been filed against the former researcher and that it concerns a sum of around 10 million crowns.

Numerous applications for funding for the research were apparently signed with forged signatures.

The scientist – who is reportedly living and working in Atlanta in the US – resigned from his post last March. But he allegedly continued to pass himself off as the head of the international project, which dealt primarily with research into the possible causes of autism.

Aarhus University also claims that the researcher took another permanent position at Emory University in the US while still heading the Danish-based project.

Danish police said they were still investigating the case but had not yet sought cooperation from US authorities in the matter. They also have yet to question the man in connection with the case.

'When we've gone through everything then we'll decide whether there are sufficient grounds to charge the researcher or any others for forgery or fraud,' said Børge Frandsen of East Jutland Police.

THE FLU CASE

Secret second job of Danish autism scientist raises fears of conflict of interest

The Flu Case, 5 March 2010
https://web.archive.org/web/20100310035735/http://www.theflucase.com/index.php?option=com_content&view=article&id=2903%3Asecret-second-job-of-danish-autism-scientist-raises-fears-of-conflict-of-interest&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A Danish scientist who was the author of a key study that undermined the scientific basis for believing that mercury in vaccines caused autism was employed full time by Emory University in the USA without his university knowing, it has emerged.

Aarhaus University said in a statement today that they had "expressly prohibited" Dr Poul Thorsen from working for a second university, Emory.

The double role of Thorsen came to light after the university detected a shortfall in funding. An investigation showed that documents from the CDC, in Atlanta, apparently promising more money for an autism research project that Thorsen administered were forged.

The university had paid out millions of crowns in advance to Thorsen and it cannot now recoup the money.

Thorsen vanished in March 2009. He is believed to be living and working in Atlanta.

Thorsen was the administrator of a 80-million crown research project funded by the CDC to uncover the causes of autism involving many different universities, including Aarhaus University.

In 2002, he was an author along with Kreesten Madsen of a key study that used data from Danish children to show that there was no link between mercury

The study was criticized for the way data was apparently manipulated but became the basis for several other high profile studies that have been used by the pharmaceutical industry and bodies such as the CDC, EMA and WHO to justify continuing to use mercury in vaccines.

The revelation that Thorsen had a second secret job will raise fears of a hidden bias in the studies and undermine the scientific case for thiomersal.

The decision by Aarhaus University to wait almost one year to inform the general public of the involvement of a leading autism author in fraudulent activities strongly swuggests the notion that scientists, government officials and big pharma are involved in a cover up of a “Vaccine-gate” style scandal.

Statement by Aarhaus University dated January 22nd but which appears only to have been made available today to the media:

AARHUS Universitet

To whom it may concern =>

Statement

Statement regarding Dr. Poul Thorsen's involvement in Aarhus University projects

Aarhus University has decided to issue this statement in response to a number of requests on the part of CDC Denmark project partners.

Issue: The extent and nature of Dr. Poul Thorsen's continued involvement in the CDC Denmark project for which he once provided primary scientific and administrative oversight, as well as of his continued relation to Aarhus University.

Background: The Danish Agency for Science, Technology and Innovation (DASTI) has been a grant recipient as part of a cooperative agreement with the US National Center for Birth Defects and Developmental Disabilities, CDC, since 2001. The grant has been administered by Odense University Hospital and Aarhus University (AU) under the direction of Dr. Poul Thorsen.

The grant has multiple components and involves collaborators at other institutions in Denmark, including the University of Copenhagen and SSI (Statens Serum Institut). This successful collaboration has resulted in numerous valuable scientific results, and many more are forthcoming.

Unfortunately, a considerable shortfall in funding at Aarhus University associated with the CDC grant was discovered. In investigating the shortfalls associated with the grant, DASTI and Aarhus University became aware of two alleged CDC funding documents as well as a letter regarding funding commitments allegedly written by Randolph B. Williams of CDC's Procurement Grants Office which was used to secure advances from Aarhus University.

Upon investigation by CDC, a suspicion arose that the documents are forgeries.

DASTI conducted an internal investigation of the authenticity of the documents and have filed a police report with no specific person named in the filing. A police investigation is ongoing.

In March 2009, Dr. Thorsen resigned his faculty position at Aarhus University. In the meantime, it has come to the attention of Aarhus University that Dr Thomsen has continued to act in such a manner as to create the impression that he still retains a connection to Aarhus University after the termination of his employment by the university. Furthermore, it has come to the attention of Aarhus University that Dr Poul Thorsen has held full-time positions at both Emory University and Aarhus University simultaneously. Dr Thorsens double Full-time employment was unauthorised by Aarhus University, and he engaged in this employment situation despite the express prohibition of Aarhus University.

Conclusion: Aarhus University wishes to confirm that Dr Poul Thorsen no longer has any connection to Aarhus University, and that Aarhus University will not be able to collaborate with Poul Thorsen in the future. To the extent that other parties collaborating with Aarhus University wish to draw on Poul Thorsen's expertise, Aarhus University will only accept such collaboration if it has the purpose of securing data or protecting the interests of participating researchers and funding agencies.

Age of Autism

Dan Olmsted, Mark Blaxill

Poul Thorsen's Mutating Resume

Age of Autism, 10 March 2010
http://www.ageofautism.com/2010/03/poul-thorsens-mutating-resume.html

In bits and pieces, in Danish and English, from three universities in two hemispheres and the CDC in Atlanta, a picture has begun forming in the past few days that is already startling in its outline: Paul Thorsen, one of the key scientists involved in CDC-backed studies exonerating vaccines as a cause of autism, is under investigation for collecting millions of dollars in bogus "grant" money, misrepresenting himself to his employers and the world and possibly forging the documents that enabled the scam.

Even more astonishing, it appears the CDC and several other major autism research centers have known about this for months and stayed publicly silent, even as the debate over autism and vaccines has reached several decisive moments -- and a new decision is expected any day from U.S. vaccine court. The CDC in particular would have a hard time claiming ignorance about the suspected crime -- at least three of the forged documents were in the agency's name, and it helped uncover the fraud last year.

In addition, several current CDC employees including Drs. Diana Schendel, Marshalyn Yeargin-Allsopp and Catherine Rice were affiliated with Thorsen's now-defunct research group. Age of Autism has obtained Internet-archived pages from the Web site of the North Atlantic Neuro-Epidemiology Alliances (NANEA) that list the members of the "Atlanta autism team" including Schendel, Yeargin-Allsopp and Rice, all of whom have been in leadership positions in the CDC's autism epidemiology projects. Schendel is described as NANEA's "coordinator at Centers for Disease Control and Prevention, Atlanta, USA." (The CDC did not respond to phone and e-mail requests for comment.)

Meanwhile, Thorsen apparently continues his involvement on an American Psychiatric Association committee that is revising the classification of autism for the next Diagnostic and Statistical Manual of Mental Disorders – a change that could affect how the prevalence of the disorder is calculated and its victims compensated and treated. (The APA did not respond to phone and e-mail requests for comment.)

Thorsen's resume, dated Jan. 22, 2010, remains on the DSM 5 Working Group members page. He lists himself as "Adjunct Associate Professor, Department of Epidemiology and Biostatistics, School of Public Health, Drexel University, Philadelphia, PA, USA."

=> https://www.rescuepost.com/files/thorsen---disclosure---1-22-10.pdf

There is also an earlier Thorsen resume still available on an APA directory dated Jan. 12, just 10 days earlier, that differs substantially from the Jan. 22 update. On that earlier resume, Thorsen calls himself "Associate Professor, Department of Epidemiology, Institute of Public Health, University of Aarhus, Denmark, & Professor, Department of Epidemiology, Rollins School of Public Health, Emory University, Atlanta, USA."

=> https://www.rescuepost.com/files/thorsen---disclosure---1-11-10.pdf

What happened in 10 days to change Thorsen's bona fides so substantially – going from apparently tenured positions at two leading autism research universities to a part-time adjunct professorship at another school?

Follow the chronology: On Jan. 22 – the day the new resume is dated – the University of Aarhus issued a statement "to whom it may concern" contradicting key parts of that first resume: “In March 2009, Dr. Thorsen resigned his faculty position at Aarhus University,” the statement said, meaning, obviously, he could not have been an associate professor of epidemiology as he was claiming as late as Jan. 12, 2010. => https://www.rescuepost.com/files/thorsen-aarhus-1.pdf

“In the meantime, it has come to the attention of Aarhus University that Dr Thomsen [sic] has continued to act in such a manner as to create the impression that he still retains a connection to Aarhus University after the termination of his employment by the university.” Of course, one way this could have come to its attention was through a resume posted at the American Psychiatric Association in which Thorsen still stated exactly that.

“Furthermore,” the statement said, “it has come to the attention of Aarhus University that Dr Poul Thorsen has held full-time positions at both Emory University and Aarhus University simultaneously. Dr Thorsens [sic] double Full-time employment was unauthorised by Aarhus University, and he engaged in this employment situation despite the express prohibition of Aar- hus University.”

Thorsen’s resume, revised and re-posted the same day as the Aarhus statement, drops the statement that he is a professor at Aarhus AND Emory, now citing only a loose academic affiliation with Drexel. It also now says his affiliation with Aarhus ended in 2008, not, as he had said 10 days earlier, that it existed “from 1998” forward to the present day. And in the update he cuts short his Emory professorship as well, saying he was at the Atlanta school in 2008-2009 (rather than from 2008 through the present). That chronology makes his tenures at Aarhus and Emory consecutive, not concurrent. Unfortunately for Thorsen, that contradicts his own original resume – and Emory contradicts the claim he was still there in 2010. On Feb. 21, 2010, the Danish publication Politiken reported [in translation]: “'He is no longer employed at Emory. He was part time occupied at the department of epidemiological research from 2003 and from April 2008 to June 2009 as full time research professor' informs assistant vice director at Emory University Sarah E. Goodwin."

All this, telling though it is in terms of favoring Aarhus’s version of events, is the least of it. The other part of the Aarhus statement said that Thorsen administered a multimillion-dollar grant from the CDC. Without naming him further, Aarhus goes on to state: “Unfortunately, a considerable shortfall in funding at Aarhus University associated with the CDC grant was discovered. In investigating the shortfalls associated with the grant, DASTI and Aarhus University became aware of two alleged CDC funding documents as well as a letter regarding funding commitments allegedly written by Randolph B. Williams of CDC's Procurement Grants Office which was used to secure advances from Aarhus University. Upon investigation by CDC, a suspicion arose that the documents are forgeries.

“DASTI conducted an internal investigation of the authenticity of the docu- ments and have filed a police report with no specific person named in the fil- ing. A police investigation is ongoing.”

Multiple Danish news sources make clear that the only suspect in any ongoing investigation anywhere is the person who held the administrative post in question and subsequently left the university – Thorsen. By now, given the fact that the CDC’s own investigation turned up the fraud, the agency presumably has had plenty of time to mull the implications. Just last month, well after the CDC had been contacted by Aarhus and determined that documents had been forged in its name, and in the middle of the Lancet’s retraction of a paper on the MMR’s possible role in the autism epidemic, the CDC’s Tom Skinner told the New York Times that the retraction “builds on the overwhelming body of research by the world’s leading scientists that concludes there is no link between M.M.R. vaccine and autism.”

Thorsen, of course, is pre-eminently one of those leading scientists and was a co-author of a New England Journal of Medicine study on the MMR. Thorsen and Aarhus, as we’ve reported for years, made important contributions to some of the most influential autism-vaccine mercury (thimerosal) studies – studies disputed as poorly done and unconvincing by critics that over the years have grown to include the head of a panel mandated by Congress to study the issue. But based on five studies, three of which included Aarhus – and one of which Thorsen co-authored – the U.S. Institute of Medicine concluded in 2004 that “the evidence now favors rejection of a relationship between thimerosal and autism.” // The question becomes, how strong is that evidence *now*?

THE FLU CASE

Robert F. Kennedy, Jr.

Validity of autism vaccine studies in question after Danish research scandal

The Flu Case, 11 March 2010, 11:25 AM
https://web.archive.org/web/20100325183921/http://www.theflucase.com/index.php?option=com_content&view=article&id=2989%3Avalidity-of-autism-vaccine-studies-in-question-after-danish-research-scandal-writes-robert-f-kennedy&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A central figure behind the Center for Disease Control's (CDC) claims disputing the link between vaccines and autism and other neurological disorders has disappeared after officials discovered massive fraud involving the theft of millions in taxpayer dollars. Danish police are investigating Dr. Poul Thorsen, who has vanished along with almost $2 million that he had supposedly spent on research.

Thorsen was a leading member of a Danish research group that wrote several key studies supporting CDC's claims that the MMR vaccine and mercury-laden vaccines were safe for children. Thorsen's 2003 Danish study reported a 20-fold increase in autism in Denmark after that country banned mercury based preservatives in its vaccines. His study concluded that mercury could therefore not be the culprit behind the autism epidemic.

His study has long been criticized as fraudulent since it failed to disclose that the increase was an artifact of new mandates requiring, for the first time, that autism cases be reported on the national registry. This new law and the opening of a clinic dedicated to autism treatment in Copenhagen accounted for the sudden rise in reported cases rather than, as Thorsen seemed to suggest, the removal of mercury from vaccines. Despite this obvious chicanery, CDC has long touted the study as the principal proof that mercury-laced vaccines are safe for infants and young children. Mainstream media, particularly the New York Times, has relied on this study as the basis for its public assurances that it is safe to inject young children with mercury – a potent neurotoxin – at concentrations hundreds of times over the U.S. safety limits.

Thorsen, who was a psychiatrist and not a research scientist or toxicologist, parlayed that study into a long-term relationship with CDC. He built a research empire called the North Atlantic Epidemiology Alliances (NANEA) that advertised its close association with the CDC autism team, a relationship that had the agency paying Thorsen and his research staff millions of dollars to churn out research papers, many of them assuring the public on the issue of vaccine safety.

The discovery of Thorsen's fraud came as the result of an investigation by Aarhus University and CDC which discovered that Thorsen had falsified documents and, in violation of university rules, was accepting salaries from both the Danish university and Emory University in Atlanta – near CDC headquarters – where he led research efforts to defend the role of vaccines in causing autism and other brain disorders. Thorsen's center has received $14.6 million from CDC since 2002.

Thorsen's partner Kreesten Madsen recently came under fierce criticism after damning e-mails surfaced showing Madsen in cahoots with CDC officials intent on fraudulently cherry picking facts to prove vaccine safety.

Leading independent scientists have accused CDC of concealing the clear link between the dramatic increases in mercury-laced child vaccinations beginning in 1989 and the epidemic of autism, neurological disorders and other illnesses affecting every generation of American children since. Questions about Thorsens's scientific integrity may finally force CDC to rethink the vaccine protocols since most of the other key pro vaccine studies cited by CDC rely on the findings of Thorsen's research group. These include oft referenced research articles published by the Journal of the American Medical Association, the American Journal of Preventive Medicine, the American Academy of Pediatrics, the New England Journal of Medicine and others. The validity of all these studies is now in question.

F. William Engdahl

Corrupt Scientist who lied about vaccines and autism vanishes with millions

The One Click Group, 12 March 2010

https://web.archive.org/web/20130605130021/http://www.theoneclickgroup.co.uk/documents/vaccines/Corrupt%20Scientist%20who%20lied%20about%20vaccines%20and%20autism%20vanishes%20with%20millions.pdf

A Danish psychiatrist (sic!) who played a central role in attempting to whitewash the role of mercury preservatives used in vaccines and the explosive rise in infant autism has apparently stolen $2 million of government research money and vanished. It is yet another black mark on the entire corruption edifice behind the pharma industry and their misuse of vaccines.

Robert F. Kennedy Jr.

According to a report from American lawyer and autism activist, Robert F. Kennedy, Jr., son of the assassinated Senator, Dr Poul Thorsen was given millions of dollars by the apparently equally corrupt US Government Center for Disease Control (CDC) to try to disprove the links between infant vaccination and the explosive growth of child autism. Kennedy, who is Chairman of the Waterkeeper Alliance and a law professor at Pace University, has been a prominent critic of the use of mercury-based Thimerosal as a preservative in vaccines given to infants.

Kennedy's prominent claims and independent statements from leading scientists led to a ban on mercury in US vaccines. However, ever since the CDC and the vaccine industry have tried to claim that Thimerosal is harmless. The key figure in that effort was Thorsen.

Thorsen was the head of a Danish research group that wrote several key studies supporting CDC's claims that the mercury-laden MMR, the standard Measles-Mumps-Rubella vaccines typically given to infants in the first months of life were safe for children. He published a 2003 Danish study that claimed a 20-fold increase in autism in Denmark after that country banned mercury based preservatives in its vaccines. He concluded that mercury could therefore not be the culprit behind the autism epidemic.

An investigation by Aarhus University and CDC discovered that Thorsen had falsified documents and, in violation of university rules, was accepting salaries from both the Danish university and Emory University in Atlanta, near CDC headquarters, where he led research efforts to defend the role of vaccines in causing autism and other brain disorders. Thorsen has received $14.6 million from US Government's CDC since 2002. His associate and partner, Kreesten Madsen was recently discovered conspiring with CDC officials to fraudulently select only favourable data to "prove" vaccine safety.

Investigation uncovered the fraud of the widely-cited Thorsen study on the alleged safety of mercury in vaccines for infants. He conveniently failed to note that the 20-fold rise in Danish autism was merely due to a new Danish law requiring for the first time that cases of autism be reported in the national registry, something not previously the case. That and the opening of a national autism clinic in Copenhagen were the sole cause of the rise according to investigation. Despite this obvious chicanery, CDC continued to cite the study as the principal proof that mercury-

laced vaccines are safe for infants and young children. Mainstream media, particularly the New York Times, cite the Thorsen study as the basis for its public assurances that it is safe to inject young children with mercury – a potent neurotoxin – at concentrations hundreds of times over the US safety limits.

Thorsen, is a psychiatrist and not a research scientist or toxicologist, but managed to build a long-term relationship with CDC. He built a research empire called the North Atlantic Epidemiology Alliances (NANEA) that advertised its close association with the CDC autism team. Now Danish police are investigating Thorsen for criminal fraud charges and claim that he has disappeared along with $2 million in US taxpayer money from the CDC.

Numerous independent scientists have accused CDC of concealing the clear link between the dramatic increases in mercury-laced child vaccinations beginning in 1989 and the epidemic of autism, neurological disorders and other illnesses affecting every generation of American children since. Questions about Thorsens's scientific integrity may finally force CDC to rethink the vaccine protocols since most of the other key pro vaccine studies cited by CDC rely on the findings of Thorsen's research group, including articles published by the Journal of the American Medical Association, the American Journal of Preventive Medicine, the American Academy of Pediatrics, the New England Journal of Medicine and others. The validity of all these studies is now in question, claims Professor Kennedy.

THE HUFFINGTON POST

Robert F Kennedy, Jr

Central Figure in CDC Vaccine Cover-Up Absconds With $2M

Huffington Post, 12 March 2010, 11:36
https://web.archive.org/web/20100314051836/http://www.huffingtonpost.com/robert-f-kennedy-jr/central-figure-in-cdc-vac_b_494303.html

A central figure behind the Center for Disease Control's (CDC) claims disputing the link between vaccines and autism and other neurological disorders has disappeared after officials discovered massive fraud involving the theft of millions in taxpayer dollars. Danish police are investigating Dr. Poul Thorsen, who has vanished along with almost $2 million that he had supposedly spent on research.

PR Newswire

Federal Vaccine Court Rules Against Autism Families

PR Newswire, 12 March 2010, 03:47 ET
https://www.prnewswire.com/news-releases/federal-vaccine-court-rules-against-autism-families-87495532.html

Government's Refusal to Fund Sound Science Stacks Deck Against Vaccine-Injured Children and Casts Doubt on the Integrity of the National Immunization Program says SafeMinds.

Washington, March 12 /PRNewswire-USNewswire/ -- Autism and mercury advocacy organization Safe-Minds regrets today's ruling by the U.S. Court of Federal Claims against three families who argued that vaccines which contained the mercury-based preservative thimerosal contributed to their child's autism. The denial of reasonable compensation to families was based on inadequate vaccine safety science and poorly designed and highly controversial epidemiology studies supported by the Centers for Disease Control and Prevention.

The Department of Health and Human Services (HHS) is the defendant in vaccine injury cases and is also responsible for carrying out the very vaccine safety research that should be integral to court decisions. This conflict of interest means the deck is stacked against families when they enter "vaccine court" and is yet one more reason for parents to doubt the integrity of the National Immunization Program.

"The government has its thumb on the scales of justice," said Laura Bono, parent of a vaccine injured child whose case was dismissed. "The Vaccine Injury Compensation Act passed by Congress in 1986 gave immunity to vaccine manufacturers and diminished the incentive to create safer products. Meanwhile, the law only gives the illusion that parents will have their day in court. The process is dysfunctional and many families will not see justice done."

Two HHS agencies, the Centers for Disease Control and Prevention (CDC) and the National Institutes of Health (NIH), are responsible for conducting vaccine safety research. Calling into question the scientific integrity of this research, a top CDC-funded vaccine researcher, Poul Thorsen, responsible for the oversight of some of the most influential and controversial studies that have been claimed as evidence for no link between autism and thimerosal, is alleged to be under investigation when funding documents were found to be forgeries and millions of dollars were missing.

The director of the NIH institute in charge of autism studies has admitted that HHS has a conflict of interest in conducting autism-vaccine research due to the court cases. Last year, the government-dominated Interagency Autism Coordinating Committee blocked critical vaccine-autism research studies from moving forward. "The government must fund an extensive vaccine safety program, including studies of the health outcomes of vaccinated and unvaccinated children," stated Lyn Redwood, Vice President of SafeMinds. "Trust in the immunization program will continue to deteriorate without adequate and unbiased safety science."

Over 5,000 petitions have been filed in the vaccine court alleging that vaccines caused a variety of damage to the developing brain, immune system, and other metabolic pathways ultimately giving rise to a diagnosis of autism. Already, the court has awarded approximately $5 million in compensation for such cases, of which the Hannah Poling case is the most well-known. Many of these cases were

quietly settled by the government so the public is not aware of them. Thus the court has already decided that vaccine injury is linked to autism. Today's ruling against families demonstrates that the process is arbitrary. The question is not whether some cases of autism have a vaccine etiology. The government has admitted that. The only remaining question is how many kids have been injured – and what must be done now to treat these kids and prevent further injury.

SafeMinds wishes to recognize the bravery and perseverance of the families who now may face a lifetime of inadequate support for their disabled children.

The Coalition for SafeMinds (Sensible Action for Ending Mercury-Induced Neurological Disorders) is a nonprofit organization founded to investigate and raise awareness of the risks to infants and children of exposure to mercury from medical products, including thimerosal in vaccines. Further information about SafeMinds and the harmful effects from mercury exposure may be found at www.safeminds.org

Washington State mercury-limit suspension for swine flu vaccine ends

MediCareUSA 24 March 2010, 04:47

https://web.archive.org/web/20100601143251/http://www.theflucase.com/index.php?option=com_content&view=article&id=3134%3Awashington-state-mercury-limit-suspension-for-swine-flu-vaccine-ends&catid=1%3Alatest-news&Itemid=64&lang=en

When it comes to some diseases prevention still is better than cure and swine flu is one such disease. The sheer global panic that gripped nations last year is hard to forget. The PanvaxH1N1 vaccine is specifically manufactured to target the influenza (A) H1N1 strain known more popularly as swine flu. Getting the flu shots may be crucial in prevention of spread of the highly contagious disease. Health officials say that the H1N1 strain of flu is still circulating but at low levels.

The Washington State Health Department has just lifted a limit on the amount of thimerosal that can be added to the H1N1 swine flu vaccine so that pregnant women and children under three can be immunized. The limits were suspended last fall when supplies of mercury-free vaccine were limited, possibly preventing vaccination of pregnant women and children under three who wanted to be immunized.

Thimerosal has been added to the majority of swine flu vaccines last year and this year as it was produced in large vials with medication for 10 shots. The preservative has a mercury compound which kills bacteria and lowers the risk of the drug getting contaminated by needles used to withdraw separate doses from the vial. Although the preservative thimerosal has not been linked to any health problems, the compound has had a murky history with many believing a link to autism exist, however to date no conclusive evidence of this link has been found.

Secretary of Health Mary Selecky said that, “Pregnant women were hit especially hard by H1N1 infections and younger children were at high risk, so we wanted to give them vaccine options. Suspending the limits made the vaccine more widely available to vulnerable people at a time when supplies were low and production was slow, but that’s no longer the case. There’s plenty of vaccine for everyone, and vaccination is the best protection against H1N1”.

The vaccination is being touted as the best protection against both swine flu and the seasonal flu. Children under ten need two shots and children over ten need just one dose. The effects of the pandemic which hit the world last year are now being studied in terms of public health impact now.

“We conclude that the 2009 A/H1N1 pandemic virus had a substantial health burden in the US over the first few months of circulation in terms of years of life lost, justifying the effort to protect the population with vaccination programs," says a report.

Andrew Wakefield

Dr Andrew Wakefield

Statement from Dr. Andrew Wakefield regarding the GMC Hearing Sanctions

6 April 2010, 11:39

https://web.archive.org/web/20100426101625/http://vaccineresistancemovement.org/?p=329
http://www.rescuepost.com/files/final-us-statement-ajw.pdf

"On Wednesday April 7th, General Medical Council (GMC) lawyers will demand that I and likely two other doctors involved in the MMR-autism case should be erased from the UK's medical register, removing our license to practice medicine.

Doctors' regulators have found the three of us - Professor John Walker-Smith, Professor Simon Murch and me - guilty of undertaking research on children with autism without approval from an ethics committee.

We can prove, with extensive documentary evidence, that this conclusion is false.

Let me make it absolutely clear that, at its heart, the GMC hearing has been about the protection of MMR vaccination policy. The case has been driven by an agenda to crush dissent that in my opinion serves the government and the pharmaceutical industry — not the welfare of children. It's important to note that there has never been a complaint against any of the doctors by any parent involved in this case – only universal parental support and gratitude.

My colleagues, Professors Walker-Smith and Murch, are outstanding pediatricians and pediatric gastroenterologists. They have led the field of pediatric gastroenterology for decades, devoting their lives to caring for sick children. Our only "crime" in this matter has been to listen to the concerns of parents, act according to the demands of our professional training, and provide appropriate care to this neglected population of children. It is unthinkable that at the end of an unimpeachable career, Professor Walker-Smith would even consider unethical experimentation on children under his care.

In the course of our work, we discovered and treated a new intestinal disease syndrome in children with autism, alleviating suffering in affected children around the world. This should be cause for celebration. Instead, we have been vilified in the press, and demonized by a wasteful PR campaign by the Department of Health. The aim of this negative publicity was to discredit my criticism of vaccine safety research.

Sadly, my colleagues have suffered severe collateral damage in this effort to prevent valid scientific enquiry. They should be exonerated, and left alone with their reputations intact, in the certain knowledge that they have done only what is right.

The loss of my own medical license is, unfortunately, the cost of doing business. Although I do not take this loss lightly, the suffering - so much of it unnecessary - that I have seen among those affected by this devastating disease makes the professional consequences for me a small price to pay by comparison.

As long as a question mark remains over vaccine safety; as long as a safety-first vaccine policy is subordinate to profit and self-interest; as long as the benefits of vaccines are threatened by those who have compromised public confidence by denial of vaccine damage, and as long as these children need help; I will continue my work."

Prakash Sharma

Doctor's to be erased from UK's Medical Register

Top News, 6 April 2010, 12:30
https://web.archive.org/web/20180629230231/http://topnews.us/content/215533-doctor-s-be-erased-uk-s-medical-register

On Wednesday, April 7 it will be demanded by the lawyers to erase the names of 3 doctors' from the UK medical register who were involved in the MMR-autism case. The 3 doctors are guilty for the research they had performed on children with autism without the approval from the Ethics committee.

It has been told by the lawyers that the hearing was about the about the security of the MMR vaccination policy and to crush the dispute, the case has been driven by a plan, which serves the government and the pharmaceutical companies and is not for the welfare of the children.

They also said that no complaints had been launched by the parents against any doctors engaged in this case.

Professors Walker-Smith and Murch said that they found a new way to treat a new intestinal disease syndrome with autism. This treatment would help the suffering children around the world. They said that instead of celebrating this they are being disparaged in the press.

The doctor said that losing his medical license was a loss to his medical career. He also mentioned that as far as these children need help, he would continue his work.

It was committed by Dr Andrew Wakefield who is an academic gastroenterologist that he would do some research on the role of intestinal inflammation and dysfunction in childhood development disorders.

Britain bans doctor who linked autism to vaccine

Yahoo News, 24 May 2010, 4:02 pm ET

https://web.archive.org/web/20100526205455/http://news.yahoo.com/s/ap/20100524/ap_on_sc/eu_britain_autism_doctor

LONDON – A doctor who persuaded millions of parents worldwide that a common vaccine could cause autism was barred from practicing medicine in his native Britain on Monday after the country's top medical group found he conducted his research unethically.

Dr. Andrew Wakefield was the first researcher to publish a peer-reviewed study suggesting a connection between autism and the vaccine for measles, mumps and rubella. That prompted legions of parents to abandon the vaccine in moves that epidemiologists feared could lead to outbreaks of the potentially deadly diseases.

Vaccination rates in Britain and other rich countries have not fully recovered since Wakefield and his colleagues' research was published in 1998 and there are measles outbreaks across Europe every year. There are also sporadic outbreaks of the disease in the U.S.

His study in the medical journal Lancet was widely discredited, however, after Britain's medical regulator found it did not meet ethical standards; other studies found no link; and a British journalist revealed Wakefield had been paid by lawyers of parents who suspected their children were harmed by the vaccine.

Wakefield, 53, moved to the U.S. in 2004 and set up an autism center in Texas, where he gained a wide following despite not being licenced as a doctor there, and faced similar skepticism from the medical community. He quit earlier this year.

Britain's General Medical Council was acting Monday on a January ruling that said Wakefield and two other doctors acted unethically and showed a "callous disregard" for the children in their study. The medical body said Wakefield took blood samples from children at his son's birthday party, paying them 5 pounds (today worth $7.20) each and later joked about the incident.

The council, which licenses and oversees doctors, found him guilty of serious professional misconduct and stripped him of his right to practice medicine in the U.K. Wakefield said he plans to appeal the ruling, which takes effect within 28 days. The investigation focused on how Wakefield and colleagues carried out their research, not on the science behind it.

Wakefield said in January that the medical council's investigation was an effort to "discredit and silence" him to "shield the government from exposure on the (measles) vaccine scandal."

Appearing from New York on NBC's "Today Show" on Monday, Wakefield described the British decision as "a little bump on the road." He claimed the U.S. government has been settling cases of vaccine-induced autism since 1991.

Wakefield said the council's ruling against him had been "made from the outset" and vowed to continue his research into the link between vaccines and autism.

"These parents are not going away; the children are not going to go away and I most certainly am not going away," he said.

Numerous studies have been conducted since Wakefield's and none has found a connection between autism and any vaccine.

Two rulings by a special branch of the U.S. Court of Federal Claims in March and last year found no link between vaccines and autism. But more than 5,500 claims have been filed by families seeking compensation for children believed to have been hurt by the measles vaccine.

Wakefield has garnered much support from parents suspicious of vaccines, including some Hollywood celebrities. In February, U.S. actress Jenny McCarthy, who has an autistic son, issued a statement with her former partner Jim Carrey.

"It is our most sincere belief that Dr. Wakefield and parents of children with autism around the world are being subjected to a remarkable media campaign engineered by vaccine manufacturers," McCarthy and Carrey said in February. "Dr. Wakefield is being vilified through a well-orchestrated smear campaign."

In Monday's ruling, the medical council said Wakefield abused his position as a doctor and "brought the medical profession into disrepute."

At the time, Wakefield was working as a gastroenterologist at London's Royal Free Hospital and did not have the ethical approval to conduct the study. The study suggested autistic children had a new bowel disease and raised the possibility of a link between autism and vaccines. He had also been paid to advise lawyers representing parents who believed their children had been hurt by the measles, mumps and rubella vaccine.

Ten of the study's authors later renounced its conclusions and it was retracted by the Lancet in February.

At least a dozen British medical associations including the Royal College of Physicians, the Medical Research Council and the Wellcome Trust have issued statements verifying the safety of the measles, mumps and rubella vaccine.

This verdict is not about (the measles) vaccine," said Adam Finn, a professor of pediatrics at the University of Bristol Medical School. "We all now know that the vaccine is remarkably safe and enormously effective...we badly need to put this right for the sake of our own children and children worldwide."

Ethan A. Huff

Multiple studies link autism to mercury, which is still present in most flu vaccines

Natural News, 12 March 2011
https://www.naturalnews.com/031678_mercury_autism.html

(NaturalNews) Despite recommendations made by the US Centers for Disease Control and Prevention (CDC) in 1999 that Thimerosal, a mercury-based preservative, be removed from vaccines, the toxic chemical is still added to the majority of flu vaccines administered to women, children, and the elderly, according to the Coalition for Mercury-Free Drugs (CoMeD), a Maryland-based non-profit organization. And according to three recent studies, the symptoms of mercury poisoning are nearly identical to those of autism symptoms, which strongly suggests that mercury in vaccines is responsible for causing autism.

Mercury is already a known neurotoxin that causes cancer (carcinogen), damages DNA (mutagen), alters proper embryonic development (teratogen), and disrupts the immune system. It is exactly the type of harmful chemical that you would never want to put in your body, and yet it is still added in the form of Thimerosal to millions of flu vaccines administered to the public.

"We have scientific studies clearly demonstrating that mercury causes neurological damage, and we have a cost-effective alternate that has already been used to replace Thimerosal as the preservative in vaccines," said Dr. Paul G. King, PhD, science advisor to CoMeD.

One such study published in the December 2010 issue of the journal *Folia Neuropathologica* explains that the mercury used in vaccines appears to directly cause neurodevelopmental disorders like autism. => Lasting neuropathological changes in rat brain after intermittent neonatal administration of thimerosal. – Folia Neuropathol. 2010;48(4):258-69. https://pubmed.ncbi.nlm.nih.gov/21225508/

Another study published in the journal *Middle East Current Psychiatry* states that "[m]ercury poisoning and autism have nearly identical symptoms".

=> Elsheshtawy E., et al. Study of some biomarkers in hair of children with autism. – Middle East Current Psychiatry 18(1):p 6-10, January 2011. DOI: 10.1097/01.XME.0000392842.64112.64.

And a study recently published in the Journal of Immunotoxicology directly states that "[n]ot only is every major symptom of autism documented in cases of mercury poisoning but also biological abnormalities in autism are very similar to side effects of mercury poisoning itself."

=> Ratajczak H.V. Theoretical aspects of autism: Causes. – J Immunotoxicology, 2011, 8(1): 68-79. https://doi.org/10.3109/1547691X.2010.545086 https://www.tandfonline.com/doi/full/10.3109/1547691X.2010.545086

It remains unclear why the toxic preservative is still used in vaccines -- especially when there are safer alternatives available – and why mainstream science continues to deny the obvious and scientifically-verifiable link between mercury and autism. The issue is not even one of opposition to vaccinations as much as it is one of opposition to neurotoxic poisons like Thimerosal that continue to deliberately be added to them.

Sherri Teneenhy

Challenging the Vaccine Dogma

The Sovereign Independent, June 2011
https://www.daily-sun.com/post/515893/Depopulation-through-force

Achilling, conticunt pattern exists in stories told by parent: My child was normal, happy, and healthy. He was walking, learnine to talk and playing with his sibling. He was on track developmentally, and everything was normal. At his one-year well baby check up, the doctor said it was time for his neat round of shots. Unquestioning, the shots were given. Within weeks, he was autistic.

The repons vary slightly an content and timing, but the descriptions of thousand of children who suddenly regress into the isolated world of autism are eerily the same.

What is Dogma?

Webster's defines dogma as "*a doctrine*; *a positive arrogant assertion of opinion*" Taking off from this definition, medical dogmas certainly abound. Many have survived for decades simply because an assertion was made and then neva questioned. Over time. the allegation was assumed to be fact.

An early example of dogma in the vaccine industry occurred in 1913 when Dr. Simon Flexnor held out that polio was a disease caused by a virus entering the body through the nose and mouth. He postulated that paralysis arose when the virus traveled directly from the sinuses to the brain and the spinal cord. Flexnor's assertions about the mode of paralysis were never reproduced and it is now known that polio is a gastrointestinal virus, not a respiratory virus.

Difficulties in developing a vaccine occurred because he propagated a dogma that the polio virus would only grow in neurological tissue, a culture media that was assoiated with life-threatening encephalitis in experimental animals.[1] No one attempted to use other types of tissue cultures to grow polioviruses. His solo paper remained unquestioned dogma for 25 years until Dr. John Enders found, serendipitously, that the virus would indeed grow in a vanety of different tissues. When Enders' revolutionary discovery was published in Science, January 28, 1949, the entire virology community immediately accepted the new findings. The polio vaccine was produced within five years. A scientific claim passed off at dognn vanished when challenged by scientific fact.

Present day vaccine dogma is promoted by The Institute of Medicine (IOM), a group of ostensibly impartial physicians, scientists and researchers. After reviewing the industry-funded research papas concluding there is no connection between vacanes and autism, the IOM similarly concludes there is no connection between vaccines and autism. How could they come to any other conclinion?

The phrase, "*temporal osnociation does not pave causality*" means that even though two events occur at the same time, one even does not cause the other. The IOM supports the dogma purported by the American Academy of Pediatrics: Since autism occurs chronologically around the same time as the first year vaccinutions, angry parents need something to blame.

The medical dogma supporting this position is the assertion that "*temporal association does not prove causality*." Simply pa the phase means that even though two events occur at nearly the same time, one event is not the cause of the other. The implication is that regression into autism would lave happened anyway. The admmistration of several vaccines immediately before the appearence of autism had nothing to do with it a dogma that promotes "*the child is to blame, not the vaccine*." Similarly, intense investigations are searching for a genetic cause fur autism spectrum disorders.[2]

The identification of a corrupted gene will point an incriminating finger at defective parents as the "cause" of their child's autism.

The following statement was published in the Center for Disease Control's publication on infection diseases, referred to as The Pink Book:

"There to no distinct syndrome from vaccine administration and therefore, many temporally associated adverse events probably represent background illness rather than illness caused by the vaccine ... the [vaccine] may stimulate or precipitate inevitable symptoms of underlying CNS disorder, such as seizures, infantile spasms, epilepsy or SIDS. By chance alone some of these cases will seem to be temporally related to [the vaccine]".[3]

With the rate of autism being one in every 150 children in the US and a new high of one in every 58 children in the U.K. an urgent investigation needs to be undertaken to establish if unvaccinated 12 to 18 month old children soddenly become autistic. There has been no answer to this question, in fact no one has even looked.

Safety Assumptions

The classic example of unquestioned dogma is the long held notion that the sun rotated around the earth. In 1530, Copernicus challenged the assumption with evidence that the earth rotated on its axis once daily and traveled around the sun once yearly. A fantastic concept for the times the new information was considered heresy. Later, when Galileo supported Copernicus conclusions, he was imprisoned subjected to a trial by Holy Inquiaitioners, and forced to withdraw his evidence to save his own life.

Similarly, parents am forced into vaccination decisions by modern day medical inquisitionas. Threats include expulsion from the medical practice and calls to children's protective services with accusations of medical neglect. Parents are told vaccines are safe and necessary for keeping children healthy. But are they really safe?

Vaccination is a medical treatment. Assumptions regarding the effectiveness of many medical treatments abound. A report published by The Government Accounting Office (GAO) concluded that "only 10-20% of all procedures currently used in medical practice have been shown to be efficacious by controlled trials".[4] Hence, 80-90% of usual and customary practices are assumed to be effective without proof. Vaccination falls into this category.

Contrary to repeated claims by the guvernment and the pharmaceutical industry, vaccines have never been proven to be safe by the gold standard of medical research: The double-blind, placebo controlled investigation. In a liacebo-cantrollal study, the safety of a medication is determined by comparing it to a neutral substance, such as a sugar pill. In vaccine safety trials, a new vaccine is not compared to an inert compound such as shot of sterile water. Instead, the "placebo" is another vaccine. If the number of side effects caused by the experimental vaccine is found to be the same as the number of reactions caused by the placebo-vaccine, manufacturers declare the new vaccine to be "*as safe as placebo*."

Another trick used by investigators to promote the safety of vaccines, is to discount any part of the study's data that suggests a problem. The following excerpt from a clinical trial demonstrates how a placebo-vaccine is used and the elimination of negative data. The study was designed to determine the safety of Comvax®, a vaccine combining the Haemophilus influenza vaccine (HiB) and the hepatitis B vaccine into one shot. During the study, 17 children (1.9%) had an event within 14 days of vaccination that met one of the defining criteria of a serious adverse experience. These experiences included seizure, asthma, diarrhea, apnea (stopped breathing) [and many others]. Virtually all of these adverse experiences were classified as serious because they involved a hospitalization. None was judged by the study investigaters to be causally related [caused by] Comvax® or the [other two vaccines]. In addition, trace deaths among participants in this study were attributed to sudden infant death syndrome that occured more than 14 days after administration of a dose of vaccinne (29, 31, and 38 days, respectively). Again, none was judged by the investigaion to be related to vateinatiat.[5]

The placebo in this study was the HiB vaccine and the hepatitis B vaccine given as two separate shots. Because the number of side effects from the single shut was similar to the number of side effects induced by the separate shots, Comvax® was declared to be "*as safe as placebo*". Imestigaton nullified the emaciation between the vaccines and SIDS with a stroke of the pen Comvax® was declared to be "*well-tolerated*".

Defining effective

Researchers define an effective vaccine as one that creates antibodies after being deposited into the bloodstream, a response called "positive seroconversion." One vaccine is considered to be more effective than another, from a researcher's perspective, if the first vaccine induces a larger antibody response than the second.[6]

The medical community and the general public define in effective vaccine as a vaccine that protects a person from the infection they have been vaccinated against. For example, the chickenpox vaccine is considered to be effective by doctors if, in the case of an outbreak, those vaccinated do not contract chickenpox.

The definitions differ substantially and have considerably different ramifications, mostly because the presence of an antibody does not assure the person will be protected from infection. Many outbreaks have occurred in fully vaccinated populations. One example was an out break of measles that occurred in a group where more than 99 percent of the population had been vaccinated.[7] Many outbreaks of chickenpox and mumps have occurred when children were fully vaccinated.[8]

The package insert of the HiBTiter®, a vaccine to protect against an infection by the H. influenza b bacteria, clearly states "*the contribution [antibodies make] to clinical protection is unknown*".[9] Similar findings have been reported about the pertussis vaccine: "*The findings of efficacy studies have not demonstrated a direct correlation between antibody* responce and protection against pertussis disease".[10] The esteemed medical jounial, Vaccine, states clearly, "It is known that, in many instances, antibody do not correlate with protection".[11]

The dogma that vaccines are safe and effective has become a medical sacred cow; an icon regarded to be above criticism or attack. Challenges to vaccination have often been written off as conspiracy theories. Parents have leaned through experience the difficulties of challenging their pediatrician's vaccine mandates. Nonetheless, many are resisting the medical profusion's dogmas about vaccine and many arc refusing vaccinations for their children.

A benchmark in a civilized society is the absence of infectious diseases, a doctrine that emerged during the pre-antibiotic era. Public health officials attribute low infection rates to mandatory vaccination policies rather than giving credit to improved personal hygiene and modem conveniences such as indoor plumbing. It is time for the truth about vaccines to he widely known. Vaccine safety has not been proven. Vaccines provide falce security about protection. Vaccines can cause harm. It is time to dispense with the "safe and effective" dogma before one more person is harmed.

THE JOURNAL OF PEDIATRICS • www.jpeds.com

Frank DeStefano, Cristofer S. Price, Eric S. Weintraub,

Increasing exposure to Antibody-Stimulating Proteins and Polysaccharides in Vaccines is not associated with risk of Autism

J Pediatrics, 30 March 2013 // August 2013; 163(2):561-7. doi: 10.1016/j.jpeds.2013.02.001
https://www.jpeds.com/article/S0022-3476%2813%2900144-3/pdf?ext=.pdf

Objective. To evaluate the association between autism and the level of immunologic stimulation received from vaccines administered during the first 2 years of life.

Study design. We analyzed data from a case-control study conducted in 3 managed care organizations (MCOs) of 256 children with autism spectrum disorder (ASD) and 752 control children matched on birth year, sex, and MCO. In addition to the broader category of ASD, we also evaluated autistic disorder and ASD with regression. ASD diagnoses were validated through standardized in-person evaluations. Exposure to total antibody-stimulating proteins and polysaccharides from vaccines was determined by summing the antigen content of each vaccine received, as obtained from immunization registries and medical records. Potential confounding factors were ascertained from parent interviews and medical charts. Conditional logistic regression was used to assess associations between ASD outcomes and exposure to antigens in selected time periods.

Results. The aOR (95% CI) of ASD associated with each 25-unit increase in total antigen exposure was 0.999 (0.994-1.003) for cumulative exposure to age 3 months, 0.999 (0.997-1.001) for cumulative exposure to age 7 months, and 0.999 (0.998-1.001) for cumulative exposure to age 2 years. Similarly, no increased risk was found for autistic disorder or ASD with regression.

Conclusion. In this study of MCO members, increasing exposure to antibody-stimulating proteins and polysaccharides in vaccines during the first 2 years of life was not related to the risk of developing an ASD. (J Pediatr 2013;163:561-7).

Discussion.

We found no evidence indicating an association between exposure to antibody-stimulating proteins and polysaccharides contained in vaccines during the first 2 years of life and the risk of acquiring ASD, AD, or ASD with regression. We also detected no associations when exposures were evaluated as cumulative exposure from birth to 3 months, from birth to 7 months, or from birth to 2 years, or as maximum exposure on a single day during those 3 time periods. These results indicate that parental concerns that their children are receiving too many vaccines in the first 2 years of life or too many vaccines at a single doctor visit are not supported in terms of an increased risk of autism.

...

Considerations of biological mechanisms should be taken into account when evaluating a possible association between autism and immunologic stimulation from vaccines early in life. The infant's immune system is capable of responding to a large number of immunologic stimuli. Beginning at birth, an infant is exposed to hundreds of viruses and other antigens, and it has been estimated that an infant theoretically could respond to thousands of vaccines at once. The possibility that immunologic stimulation from vaccines during the first 1-2 years of life could be related to the development of ASD is not well supported by the known neurobiology of ASD, which tends to be genetically determined with origins in prenatal development, although possible effects in early infancy cannot be ruled out completely. *It can be argued that ASD with regression, in which children usually lose developmental skills during the second year of life, could be related to exposures in infancy, including vaccines*; however, we found no association between exposure to antigens from vaccines during infancy and the development of ASD with regression.

(Oct 5 2009) – Autism Prevalence Now At 1 in 91 Children, 1 in 58 Boys:
=> http://whale.to/vaccine/autism_prevalence.html

Virginia – (SafeMinds.org) Today the Maternal & Child Health Bureau of Health Resources and Services Administration (HRSA), US Department of Health and Human Services released a study evaluating the number of children in the U.S. who currently have a Autism Spectrum Disorder (ASD) diagnosis, The Prevalence of Parent-Reported Diagnosis of Autism Spectrum Disorder among Children in the United States, 2007. The Study evaluated data from a national Survey of Children's Health and found that 1 in 91 children between the ages of 3 and 17 currently carry an ASD diagnosis -1 in 58 boys. Even more alarming, for the subset of children between ages 6 and 14 immunized during the 1990's the prevalence is actually 1 in 71 children with an autism diagnosis. This age group represents children in the U.S. with the highest exposure to thimerosal, the mercury preservative routinely used until CDC, AAP and industry recommended its removal "as soon as possible" from all childhood vaccines. Despite this recommendation, mercury, one of the most neurotoxic substances on the planet, is still used in most seasonal and H1N1 vaccines.

(Jun 17 2014) – CDC's Cover-Up of link between Autism & Mercury in Vac's U.S.A
=> https://childrenandautism.com/study-finds-evidence-cdc-cover-link-autism-mercury-vaccines/

A controversial new study published in Biomed Research International titled, "Methodological Issues and Evidence of Malfeasance in Research Purporting to Show Thimerosal in Vaccines Is Safe," has exposed convincing evidence of wrong-doing on the part of the Center for Disease Control and Prevention (CDC) in actively covering up the causal link between mercury in vaccines (Thimerosal) and harm to infants and children.

Methodological Issues and Evidence of Malfeasance in Research Purporting to Show Thimerosal in Vaccines is Safe.

BioMed Research International, 4 June 2014
https://doi.org/10.1155/2014/247218 // https://onlinelibrary.wiley.com/doi/10.1155/2014/247218

Abstract

There are over 165 studies that have focused on Thimerosal, an organic-mercury (Hg) based compound, used as a preservative in many childhood vaccines, and found it to be harmful.

Of these, 16 were conducted to specifically examine the effects of Thimerosal on human infants or children with reported outcomes of death; acrodynia; poisoning; allergic reaction; malformations; auto-immune reaction; Well's syndrome; developmental delay; and neurodevelopmental disorders, including tics, speech delay, language delay, attention deficit disorder, and autism.

In contrast, the United States Centers for Disease Control and Prevention states that Thimerosal is safe and there is "no relationship between [T]himerosal[-]containing vaccines and autism rates in children." This is puzzling because, in a study conducted directly by CDC epidemiologists, a 7.6-fold increased risk of autism from exposure to Thimerosal during infancy was found.

The CDC's current stance that Thimerosal is safe and that there is no relationship between Thimerosal and autism is based on six specific published epidemiological studies coauthored and sponsored by the CDC.

The purpose of this review is to examine these six publications and analyze possible reasons why their published outcomes are so different from the results of investigations by multiple independent research groups over the past 75+ years.

8. Conclusion

As seen in this review, the studies upon which the CDC relies and over which it exerted some level of control report that there is no increased risk of autism from exposure to organic Hg in vaccines, and some of these studies even reported that exposure to Thimerosal appeared to decrease the risk of autism..

Considering that there are many studies conducted by independent researchers which show a relationship between Thimerosal and neurodevelopmental disorders, the results of the six studies examined in this review, particularly those showing the protective effects of Thimerosal, should bring into question the validity of the methodology used in the studies. A list of the most common methodological issues with these six studies is shown in Table 1. Importantly, other than the Hviid et al. [23] study, five of the publications examined in this review *were directly commissioned by the CDC*, raising the possible issue of conflict of interests or research bias, since vaccine promotion is a central mission of the CDC. Conceivably, if serious neurological disorders are found to be related to Thimerosal in vaccines, such findings could possibly be viewed as damaging to the vaccine program.

Study Finds Evidence for CDC Cover-Up of Link Between Autism and Mercury in Vaccines

Green Med *infro*, 16 June 2014
https://greenmedinfo.com/blog/study-finds-evidence-cdc-cover-link-between-autism-and-mercury-vaccines

A new study finds the CDC may have covered up the clear and present danger associated with mercury in vaccines. Republished from http://www.greenmedinfo.com

A controversial new study published in *Biomed Research International titled, Methodological Issues and Evidence of Malfeasance in Research Purporting to Show Thimerosal in Vaccines Is Safe, has exposed convincing evidence of wrong-doing on the part of the Center for Disease Control and Prevention (CDC) in actively covering up the causal link between mercury in vaccines (Thimerosal) and harm to infants and children.*
=> https://doi.org/10.1155/2014/247218 // https://onlinelibrary.wiley.com/doi/10.1155/2014/247218

According to the review, "There are over 165 studies that have focused on Thimerosal, an organic mercury (Hg) based compound, used as a preservative in many childhood vaccines, and found it to be harmful. Of these, 16 were conducted to specifically examine the effects of Thimerosal on human infants or children with reported outcomes of death; acrodynia; poisoning; allergic reaction; malformations; auto-immune reaction; Well's syndrome; developmental delay; and neurodevelopmental disorders, including tics, speech delay, language delay, attention deficit disorder, and autism." [references for the 16 studies can be found here: #3-16]

While the Center for Disease Control and Prevention (CDC) states there is "no relationship between [T]himerosal[-]containing vaccines and autism rates in children,"[1]" the researchers pointed out that a study conducted by CDC epidemiologists found a 7.6-fold increased risk of autism from exposure to Thimerosal during infancy.

Moreover, "The CDC's current stance that Thimerosal is safe and that there is no relationship between Thimerosal and autism is based on six specific published epidemiological studies coauthored and sponsored by the CDC.

Owing to this glaring contradiction the review sought out to examine closely these six CDC conducted studies to find out how their results conflict with the findings of 75+ years of past research performed by multiple independent research groups that did find clear evidence of harm.

A closer look at the review

The review references 16 studies that show Thimerosal exposure is associated with the subsequent diagnosis of neurodevelopmental disorders such as autism. This brings to the fore the obvious question: 'how does the CDC conclude that there is no evidence of that relationship?'

According to the review, there are six studies the CDC references which deny the link:

"These studies include (1) the Madsen et al.[2] ecological study of autism incidence versus Thimerosal exposure in Denmark, (2) the Stehr-Green et al.[3] ecological study of autism incidence versus Thimerosal exposure in Denmark, Sweden, and California, (3) the Hviid et al.[4] study of

autism incidence versus Thimerosal exposure in Denmark (also ecological), (4) the Andrews et al.[5] cohort study of autism incidence and Thimerosal exposure in the United Kingdom, (5) the published Verstraeten et al [6] CDC cohort study of autism incidence and Thimerosal exposure in the United States, and (6) the more recent Price et al.[7] case-control study of autism incidence and Thimerosal exposure in the United States. Although the CDC cites several other publications to purport the safety of Thimerosal, only these six specifically consider its putative relationship to autism."

The review of these six studies found that there were serious methodological issues present, listed as follows:

Study reviewed	**Methodological issues**
Madsen et al. [2]	(i) Changing entrance criteria in ecological studies. (ii) Withholding important results from the final publication. (iii) Conclusions not generalizable to the US vaccination schedule due to widely different vaccination schedules and different levels of Thimerosal dosing in other countries.
Stehr-Green et al. [3]	(i) Changing entrance criteria in ecological studies. (ii) Withholding important results from the final publication. (iii) Conclusions not generalizable to the US vaccination schedule due to widely different vaccination schedules and different levels of Thimerosal dosing in other countries.
Hviid et al. [4]	(i) Accounting for "person-years" regarding exposure rather than actual exposure levels. (ii) Conclusions not generalizable to the US vaccination schedule due to widely different vaccination schedules and different levels of Thimerosal dosing in other countries.
Andrews et al. [5]	(i) Accounting for "person-years" regarding exposure rather than actual exposure levels. (ii) Conclusions not generalizable to the US vaccination schedule due to widely different vaccination schedules and different levels of Thimerosal dosing in other countries.
Verstraeten et al. [6]	(i) Cohort of children too young for followup for an autism diagnosis. (ii) "Overmatching" phenomena due to too closely matched cases and controls. (iii) Withholding important results from the final publication.
Price et al. [7]	(i) "Overmatching" phenomena due to too closely matched cases and controls. (ii) Withholding important results from the final publication.

The reviewers pointed out that all but one of these CDC 'commissioned' studies were likely influenced by conflict-of-interest/malfeasance, owing to their consistent methodological errors, their running contrary the body of evidence showing mercury in vaccines do harm, and the implications their questionable results have for the CDC's aggressive pro-vaccine agenda:

"[F]ive of the publications examined in this review were directly commissioned by the CDC, raising the possible issue of conflict of interests or research bias, since vaccine promotion is a central mission of the CDC. Conceivably, if serious neurological disorders are found to be related to Thimerosal in vaccines, such findings could possibly be viewed as damaging to the vaccine program."

The only CDC-sponsored study that found a clear link between mercury in vaccines and neurodevelopmental disorders including autism — The Verstraeten et al. (2003) Study[8] — had 5 phases, with each successive phase seemingly manipulated to show less harm. Email evidence obtained through the US Freedom of Information Act of 1950 also indicates that lead researcher may have been pressured to water down the study results.

The study's five phases:

- *In the first phase*, a subset of medical records were obtained from databases for several of the HMOs whose records were maintained in a central data repository, the Vaccine Safety Datalink: "Results from the first phase of the study released in an internal presentation abstract by Verstraeten et al. [20] (mentioned earlier) using records from four (4) HMOs showed that infants who were exposed to greater than 25µg of Hg in vaccines and immunoglobulins at the age of one month were 7.6 times more likely to have an autism diagnosis than those not exposed to any vaccine-derived organic Hg. Within the same abstract, Verstraeten reports that the risk for any neurodevelopmental disorder was 1.8, the risk for speech disorder was 2.1, and the risk for nonorganic sleep disorder was 5.0. All relative risks were statistically significant.

- "*In the second phase* of the study, a different approach was taken: exposure was compared at 3 months of age, rather than one month. Results of this phase showed that children exposed to the maximum amount of organic Hg in infant vaccines (62.5 µg) were 2.48 times more likely to have autism diagnosis compared to those exposed to less than 37.5 µg of Hg in vaccines. These results were also statistically significant. No assessment against a "no exposure" control was apparently completed in this study phase.

- "*In the third phase* of the study, in which more data stratification methods and different inclusion/exclusion criteria were applied to the analysis, the relative risk of autism for children at three months of Thimerosal exposure dropped to 1.69. At this point, evidence in an email from Verstraeten, the lead investigator, written to a colleague outside of the CDC (obtained by the authors via the US Freedom of Information Act of 1950 as amended), suggests that Verstraeten could have been receiving pressure within the CDC to apply unsound statistical methods to deny a causal relationship between Thimerosal and autism. In this email, Verstraeten states (Figure 1), "I do not wish to be the advocate of the anti-vaccine lobby and sound like being convinced that thimerosal is or was harmful, but at least I feel we should use sound scientific argumentation and not let our standards be dictated by our desire to disprove an unpleasant theory."

- "*The fourth and fifth phase* of the study used records from only two of the original HMOs and incorporated a third HMO, Harvard Pilgrim, into the analysis. Some critics of the study questioned the use of Harvard Pilgrim, as this HMO appeared to be riddled with uncertain record keeping practices, and the state of Massachusetts had been forced to take it over after it declared bankruptcy. In addition, the HMO used different diagnostic codes than the other two HMOs used in phases 2 and 3. Other criticisms include that the study used younger children, from 0 to 3 years of age, even though the average age for an autism diagnosis at the time was 4.4 years. Since half of the children receiving an autism diagnosis would be over 4.4 years of age, far greater than the maximum age in the study at 3 years, this analysis excluded more than 50% of all autism cases from this HMO. Also, the cohort from this HMO contained 7 times fewer individuals than the main cohort from the previous study (i.e., HMO B), and there was no apparent attempt to assess the power of this HMO to show any statistically significant effect."

Clearly, this new review indicates what is on the line when it comes to the clear and present danger associated with injecting mercury into infants and children, over and above the already questionable practice of injecting hundreds of active and 'inactive' vaccine antigens into our offspring at their most critical and sensitive developmental window. The conventional medical establishment still maintains that there is a scientific consensus on mercury's safety in vaccines, despite the fact that it began to be phased out from the routine vaccination schedule in the United Sates, European Union, and other affluent countries, in 2005, in order to assuage popular and presumably irrational fears among irrational parents and so called 'anti-vaxers.'The fact that autism and autism spectrum disorder diagnoses have continued to expand, despite Thimerosal's 'precautionary' phase out in 2001 in the 'developed world,' is often used as 'evidence' that mercury was never a

contributing factor. What may be more salient is the phase out reflected a tacit acknowledgment that Thimerosal was indeed a factor in the accumulating evidence for unintended, adverse health effects of vaccines. Also, mounting research now points to substituted vaccine adjuvants like aluminum hydroxide continuing to contribute to an epidemic of autoimmunity in immunized populations, including damage to the nervous system consistent with an explanation for vaccine-induced autism and related neurodevelopmental conditions.[9]What this study shows is there was never a consensus on its safety, but rather smoke in mirrors generated in response to a signal of harm. And insofar as the CDC appears to have actively manipulated the results it uses as 'evidence' to support its hardline policies and increasingly obvious agenda of mandatory vaccination, we owe it to ourselves to continue to exercise extreme caution in defaulting to faith in 'authority' over the scientific evidence and commonsense itself.

CNN iReport

Fraud at the CDC uncovered, 340% risk of autism hidden from public

CNN iReport, 24 August 2014

https://web.archive.org/web/20140905002008/http://ireport.cnn.com/docs/DOC-1164794

8/27/2014 17:10 EST - CDC Whistleblower William Thomas has released a formal statement confirming the original study found a link between MMR and Autism, especially in African American and that the CDC hid the results.

A top researcher at the Centers for Disease Control and Prevention (CDC), Dr William Thompson, admits he played a key role in helping uncover data manipulation by the CDC. This fraud obscured a higher incidence of autism in African-American boys due to the MMR vaccine. The whistleblower, Dr. William Thompson, came forward after a Freedom of Information Act (FOIA) request for original data on an autism study was filed and these highly sensitive documents were received with the assistance of U.S. Representative Darrell Issa, Chairman of the House Oversight and Government Reform Committee. The CDC documents and discussions with the whistleblower reveal widespread manipulation of scientific data and top-down pressure on CDC scientists to suppress a causal link between the MMR vaccine and later autism diagnosis, particularly in a subset of African-American males who received their immunization "on-time" in accordance with the recommended CDC schedule.

The received documents from the CDC show that in 2003 a 340% risk of autism in African American boys related to the MMR vaccine was discovered and then hidden due to pressure from senior officials. The CDC researchers then recalculated their results by removing a population to get the results that were desired. Even with the recalculated data from the original report a significant risk of autism due to the MMR is found and can be seen in the IOM presentation of the original study, highlighted on page 29 and 31.

Presantation: Age at First Measles Measles – Mumps – Rubella Vaccination in Children with Autism and School – Matched Control Subjects

https://web.archive.org/web/20160530043310/http://www.nationalacademies.org/hmd/~/media/Files/Activity%20Files/PublicHealth/ImmunizationSafety/DeStefanoslides.pdf

William Thompson has worked for the government agency for over a decade and confirmed that "the CDC knew about the relationship between the age of first MMR vaccine and autism incidence in African-American boys as early as 2003, but chose to cover it up." He remarked "we've missed ten years of research because the CDC is so paralyzed right now by anything related to autism. They're not doing what they should be doing because they're afraid to look for things that might be associated." He alleges criminal wrongdoing by his supervisors, and he expressed deep regret about his role in helping the CDC hide data.

This increase in the rate of regressive autism in African Americans has also been found. Autism Speaks reports that "*Regressive Autism Reported Twice as Often among African American Children*";
https://web.archive.org/web/20140602025922/http://www.autismspeaks.org/science/science-news/regressive-autism-reported-twice-often-among-african-american-children
It would seem to be directly connected to the recent release of documents CDC documents and admissions by CDC Government researcher William Thompson.

Thompson's revelations call into question the nine other studies cited by the CDC as evidence denying a link between vaccines and autism. They also have spurred a change.org petition to have the fraudulent study retracted from the Journal of Pediatrics, which published it in 2004.

A recently released memo from 2004 of Dr. Thompson expressing concerns to Dr. Gerberding, the head of the CDC at the time, about this problematic study has citizens upset. Does this mean Dr. Gerberding could have committed perjury during a congressional hearing? More investigation will be needed to know. A copy of the letter obtained under FOIA can be found here.
=> http://www.naturalnews.com/images/CDC-Gerberding-Warning-Vaccines-Autism.jpg
Regardless many citizens view this as a deliberate malfeasance at the taxpayers' expense have begun a social media blitz to inform others of this story as it unfolds. Using the Twitter hashtags #CDCwhistleblower and #CDCfraud. Parents are hoping to have the agency held accountable for its role in any cover-up and are demanding an investigation on whether Dr. Coleen Boyle also perjured herself in testimony before Congress when addressing concerns of a potential vaccine-autism link.

The US Department of Health Resources and Services Administration has already recognized autism as a secondary cause of vaccine injury as documented in the Update to the Vaccine Injury Table following the 2011 IOM report. They did reject Autism as a direct adverse effect of the MMR specifically, but in view of these revelations that may be revisited.
https://web.archive.org/web/20140426050618/http://hrsa.gov/vaccinecompensation/iomreportupdate030812.pdf

The CDC responded to these claims stating that they recognize this study showed an increased risk of autism from the MMR:
"*findings revealed that vaccination between 24 and 36 months was slightly more common among children with autism, and that association was strongest among children 3-5 years of age.*"
They dismissed this with an assumption that parents with children that have autism rushed to get vaccinated for school.
"*... most likely a result of immunization requirements for preschool special education program attendance in children with autism*."
This raises questions as there are immunization requirements for all children attending public school and they already excluded children that had a vaccine exemption, so this should not have differed from the controls.

An addition the CDC states they excluded the population in question due not having a Georgia birth certificate: "

1. The subset of children who had a Georgia birth certificate.
Access to the information on the birth certificates allowed researchers to assess more complete information on race as well as other important characteristics, including possible risk factors for autism such as the child's birth weight, mother's age, and education. This information was not available for the children without birth certificates;"

There is a problem with this statement as the CDC could have still gotten the needed data from out-of-state birth certificates, They would have had those in the school records as with the kids born in Georgia. So saying they could not get the data on mothers occupation and birth weight is false in and of itself.

The CDC also states that
"Additional studies and a more recent rigorous review by the Institute of Medicine have found that MMR vaccine does not increase the risk of autism".

The Studies that the CDC uses to confirm no link between the MMR and autism are 4 that they list on their website at *Vaccine Safety*: *Measles, Mumps, and Rubella (MMR) Studies*.
=> https://web.archive.org/web/20141010074840/http://www.cdc.gov/vaccinesafety/Vaccines/MMR/MMR.html
A quick look at these 4 studies raises several questions.

- One is the study talked about in this article showing a significant connection
- A second was done by the infamous Dr. Thorsen who is awaiting extradition to the US on Fraud and is listed on the CDC's most wanted list putting any of his work into question and this is outside of other potential problems with the study that have been brought up.
- A third is an exploratory study of very small sample sizes, 28 children total, making this unreliable. http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2526159/
- The last one also used a small control sample size of only 31 children and relied on parent interviews to provide medical and behavioral information. Beyond that they did find that oer half (50%) of children with autism did regress shortly after the MMR vaccine (<5 months) even though they then concluded there was no connection
  http://www.bu.edu/autism/files/2010/03/2006-Richler-et-al-MMR-Vaccine1.pdf

This begs the question as to why there are only these four studies used to support the claims that the MRR is safe and yet a quick search of PubMed finds A 2012 peer reviewed research paper studying over 500,000 children that found significant increase adverse effects after certain MMR vaccinations including a 22 Times increased risk of meningitis, 500% increase risk of febrile seizure, and other major side effects including a blood clotting disorder.
[Demicheli V, et al. Vaccines for measles, mumps and rubella in children. Cochrane Database Syst Rev. 2012 Feb 15;2012(2):CD004407. doi: 10.1002/14651858.CD004407.pub3. Update in: Cochrane Database Syst Rev. 2020 Apr 20;4:CD004407. doi: 10.1002/14651858.CD004407.pub4. PMID: 22336803; PMCID: PMC6458016. http://www.ncbi.nlm.nih.gov/pubmed/22336803

The full CDC statement can be seen here
https://web.archive.org/web/20140902175535/http://www.cdc.gov/vaccinesafety/Concerns/Autism/cdc2004pediatrics.html

A recent release of another document shows that William Thompson was so concerned with the report, in light of a 2002 Department of Justice (DOJ) investigation, that the he considered removing his name from the paper. In light of his recent statements and released documents could all of the lawyers involved have been to try and prevent information release? Credit to NaturalNews for the release of this information:

Translational Neurodegeneration

Brian S. Hooker

Measles-mumps-rubella vaccination timing and autism among young african american boys: a reanalysis of CDC data.

Transl Neurodegener, 27 August 2014, 3 (16)
https://doi.org/10.1186/2047-9158-3-16

Abstract

Background

A significant number of children diagnosed with autism spectrum disorder suffer a loss of previously-acquired skills, suggesting neurodegeneration or a type of progressive encephalopathy with an etiological basis occurring after birth. The purpose of this study is to investigate the effectof the age at which children got their first Measles-Mumps-Rubella (MMR) vaccine on autism incidence. This is a reanalysis of the data set, obtained from the U.S. Centers for Disease Control and Protection (CDC), used for the Destefano et al. 2004 publication on the timing of the first MMR vaccine and autism diagnoses.

Methods

The author embarked on the present study to evaluate whether a relationship exists between child age when the first MMR vaccine was administered among cases diagnosed with autism and controls born between 1986 through 1993 among school children in metropolitan Atlanta. The Pearson's chi-squared method was used to assess relative risks of receiving an autism diagnosis within the total cohort as well as among different race and gender categories.

Results

When comparing cases and controls receiving their first MMR vaccine before and after 36 months of age, there was a statistically significant increase in autism cases specifically among African American males who received the first MMR prior to 36 months of age. Relative risks for males in general and African American males were 1.69 (p=0.0138) and 3.36 (p=0.0019), respectively. Additionally, African American males showed an odds ratio of 1.73 (p=0.0200) for autism cases in children receiving their first MMR vaccine prior to 24 months of age versus 24 months of age and thereafter.

Conclusions

The present study provides new epidemiologic evidence showing that African American males receiving the MMR vaccine prior to 24 months of age or 36 months of age are more likely to receive an autism diagnosis.

Conclusions

The present study provides new evidence of a statistically significant relationship between the timing of the first MMR vaccine and autism incidence in African American males. Using a straight-forward, Pearson's chisquared analysis on the cohort used in the Destefano et al. [14] (CDC) study, timing of the first MMR vaccine before and after 24 months of age and 36 months of age showed relative risks for autism diagnoses of 1.73 and 3.36, respectively. Future studies should be completed to further evaluate the relationship of first MMR timing and neurodevelopmental maladies, including autism, especially in underserved populations.

Routine childhood vaccination is considered an important public health tool in reducing the morbidity and mortality associated with infectious diseases. However, consideration should be made in the current United States vaccination schedule for genetic subpopulations that may be associated with vaccine adverse events. Additional research is required to better understand the relationship between MMR exposure and autism in African American males.

CNN révèle la fraude du CDC – L'autisme est bien causé par les vaccins

Free WiseMan, 20 September 2014 // Silence on Vaccine, 27 September 2014
https://linabmoreco.wordpress.com/
https://freewiseman.wordpress.com/2014/09/20/cnn-revele-la-fraude-du-cdc-lautisme-est-bien-cause-par-les-vaccins/

Le lanceur d'alerte du CDC, le Dr William Thompson a publié une déclaration officielle confirmant que l'étude originale avait montré un lien entre le vaccin ROR (Rougeole-Oreillons-Rubéole) et l'autisme, plus spécialement chez les enfants afro-américains, et que le CDC en avait caché les résultats.

Un éminent chercheur aux Centres de Contrôle et de Prévention des Maladies (CDC), le Dr William Thompson admet qu'il a joué un rôle clé en aidant à faire apparaître au grand jour la manipulation des données par le CDC. Cette fraude a consisté à dissimuler une incidence plus élevée de l'autisme due au vaccin ROR chez les garçons afro-américains. Le lanceur d'alerte, le Dr William Thompson a avoué les faits après que le Dr Brian Hooker ait réclamé et obtenu, en vertu de la Loi sur la Liberté de l'Information (Freedom of Information Act ou FOIA), les données originales d'une étude portant sur l'autisme, avec l'aide du député américain Darrell Issa, président de la Chambre de surveillance et de la réforme du gouvernement. Les documents du CDC, ainsi que les discussions avec le lanceur d'alerte révèlent *une manipulation généralisée des données scientifiques,* ainsi qu'une pression (du haut vers le bas) sur le scientifique du CDC pour supprimer tout lien de causalité entre le vaccin ROR et le diagnostic ultérieur d'autisme, en particulier dans un groupe d'hommes afro-américains qui avaient reçu leur vaccin « à temps » en conformité avec le calendrier recommandé par le CDC.

Les documents reçus du CDC montrent qu'en 2003, on a découvert comme étant lié au vaccin ROR *un risque d'autisme chez les garçons afro-américains de 340%*. La découverte de ce risque a été cachée sous la pression de hauts fonctionnaires. Les chercheurs du CDC ont alors recalculé leurs résultats en omettant d'inclure une population donnée afin de pouvoir obtenir les résultats désirés. Mais même en recalculant ainsi les données après avoir omis cette population, un risque significatif d'autisme est encore retrouvé en lien avec le vaccin ROR. La mention d'un tel risque se retrouve par ailleurs également dans la présentation de l'étude originale faite par l'Institut de Médecine (IOM) (cf. pages 29 et 31 de cette présentation)

Le Dr William Thompson qui a travaillé pour l'Agence gouvernementale pendant plus d'une décennie a confirmé que :

«Depuis les débuts de 2003, le CDC était au courant de la relation qui existait entre l'incidence de l'autisme et l'âge auquel le premier vaccin ROR était administré chez les garçons Afro-Américains, mais a choisi de dissimuler la chose.»

Il a fait remarquer:

«Nous avons perdu dix années de recherche parce que le CDC est actuellement tellement paralysé par tout ce qui touche à l'autisme. Ils ne font pas ce qu'ils devraient faire parce qu'ils ont peur des conclusions qui pourraient être tirées.»

Il prétend que ses supérieurs ont commis des actes criminels et a exprimé son profond regret quant à son rôle qui a contribué à masquer les données du CDC.

Cette augmentation du taux d'autisme régressif chez les Afro-Américains a bel et bien été trouvée. L'association *Autisme Speaks* (fondée en 2005 par les grands-parents d'un enfant autiste) signale que « la question du risque d'autisme régressif chez les enfants Afro-Américains a déjà été posée deux reprises ».

Il semble que la chose soit directement liée à la sortie récente des documents du CDC, ainsi qu'aux aveux du chercheur du CDC, le Dr William Thompson.

Les révélations du Dr Thompson remettent en question les neuf autres études citées par le CDC comme preuves permettant de nier un lien entre autisme et vaccins. Ces révélations ont également suscité une pétition (sur change.org) pour que l'étude frauduleuse soit retirée du journal *Pediatrics* qui fut publié en 2004.

Une note de service de 2004 dans laquelle le Dr Thompson exprimait déjà au Dr Gerberding (chef du CDC à l'époque) ses inquiétudes sur cette étude problématique, a été récemment publiée. Cette étude a bouleversé les citoyens. Cela signifierait-il que le Dr Gerberding aurait commis un parjure au cours d'une audition au Congrès? Un examen plus approfondi sera nécessaire pour le savoir.

Lire ici la copie de la lettre obtenue grâce à la Loi sur la Liberté de l'Information (FOIA) =>
http://idata.over-blog.com/3/27/09/71/aout-2013/Janvier-2014/CDC-Gerberding-Warning-Vaccines-Autism.jpg

Quoi qu'il en soit, de nombreux citoyens qui considèrent la chose comme un méfait délibéré, à la charge des contribuables, ont entamé une campagne médiatique (Twitter etc.) pour informer le public de cette histoire et de ses conséquences. Les parents espèrent que l'Agence sera tenue responsable des dissimulations qui ont été effectuées. Ils réclament également une enquête pour que l'on puisse savoir si le Dr Coleen Boyle aurait aussi commis un parjure dans son témoignage devant le Congrès, quand elle avait été publiquement interrogée sur la question des liens possibles entre les vaccins et l'autisme.

Le Département Américain des Ressources de Santé et des Services de l'Administration a déjà reconnu que l'autisme pouvait être une conséquence indirecte de dommages vaccinaux comme ce fut documenté dans la mise à jour du tableau « Dommages vaccinaux » qui a fait suite au rapport de l'Institut de Médecine (IOM) de 2011. Ils ont rejeté l'autisme comme effet secondaire direct et spécifique de la vaccination ROR mais au vu des dernières révélations, les textes pourraient subir des modifications.

Le CDC a répondu à ces allégations en indiquant qu'ils reconnaissaient que cette étude avait montré une augmentation du risque d'autisme avec le ROR :

«Les résultats des recherches ont révélé qu'entre 24 et 36 mois, la vaccination était légèrement plus fréquente chez les enfants atteints d'autisme, et que cette association était la plus forte chez les enfants de 3 à 5 ans. »

Ils ont rejeté la chose en avançant l'hypothèse que les parents dont les enfants sont autistes se sont précipités pour les faire vacciner avant de rentrer à l'école.

«La chose la plus probable est que tout résulte des exigences de vaccinations préscolaires»
Programme spécial d'éducation pour les enfants atteints d'autisme

Cela soulève des questions parce qu'il y a des exigences de vaccination *pour tous les enfants* qui fréquentent l'école publique et que les enfants qui disposent d'une exemption pour les vaccins ont déjà été exclus du compte (de l'étude réalisée).

Le CDC indique également que:

«*Des études complémentaires, ainsi qu'un examen rigoureux plus récent de l'Institut de Médecine ont établi que le vaccin ROR ne pouvait pas augmenter le risque d'autisme.»*

Les études sur lesquelles le CDC se base pour affirmer qu'il n'y a aucun lien entre le vaccin ROR et l'autisme sont au nombre de 4. Le CDC reprend ces études sur son site. => *Vaccine Safety: Measles, Mumps, and Rubella (MMR) Vaccine.* – CDC
https://web.archive.org/web/20091110193818/http://www.cdc.gov/vaccinesafety/Vaccines/MMR/MMR.html

Un rapide coup d'œil à ces 4 études soulève plusieurs questions.

* La première étude montre un lien significatif (entre les vaccins et l'autisme)

* La seconde étude a été réalisée par l'infâme Dr Thorsen qui attend son extradition vers les Etats-Unis pour cause de fraude. Il est repris sur la liste du CDC comme l'homme le plus recherché – l'instance ayant remis tout son travail en question- et ceci sans parler des autres problèmes potentiels qui ont été soulevés au sujet de cette étude.

* La troisième étude est de nature préparatoire/préliminaire. Elle se base sur de très faibles échantillons : 28 enfants au total, ce qui est très peu.

* *La dernière étude a p*orté sur 31 enfants pour l'échantillon de contrôle et s'est appuyée sur des entrevues avec les parents pour fournir des renseignements médicaux et comportementaux. Ensuite, ils ont constaté que plus de la moitié (50%) des enfants atteints d'autisme ont régressé peu de temps après la vaccination ROR ((dans un délai de moins de 5 mois après la vaccination), alors même qu'ils ont conclu qu'il n'y avait pas de connexion.

Cela pose la question de savoir pourquoi il n'y a que quatre études qui ont été utilisées pour appuyer les allégations que le ROR est un vaccin sûr. Une recherche rapide sur *PubMed* permet de tomber sur un document de recherche de 2012, revu par les pairs et qui a porté sur l'étude de plus de 500.000 enfants. Cette recherche a mis en évidence **une augmentation significative des effets secondaires après la vaccination ROR**: 22 fois plus de risques de méningite, 500% d'augmentation du risque de convulsions fébriles et autres effets secondaires majeurs, y compris des troubles de la coagulation.

La déclaration complète du CDC peut être lue ici.

La récente publication d'un autre document, relatif à une enquête du Ministère de la Justice en 2002, a montré que le Dr William Thompson était à ce point préoccupé par ce rapport qu'il a envisagé de retirer son nom du document. A la lumière de ses récentes déclarations et des documents publiés sur cette affaire, ne serait-on pas en droit de se demander si tous les avocats concernés n'auraient pas tenté d'empêcher la divulgation de cette information ?

No link between MMR and autism, major study concludes

The Guardian, 21 April 2015, 16.00 BST
https://www.theguardian.com/society/2015/apr/21/no-link-between-mmr-and-autism-major-study-concludes

Research involving cohort of 95,000 children is latest research to contradict findings of discredited gastroenterologist Andrew Wakefield.

A major study published in one of the world's leading medical journals has concluded that there is no link between the MMR (measles, mumps and rubella) vaccination and autism in children.

The findings from the study of a cohort of around 95,000 children will not surprise most scientists, who have been reassuring parents of the jab's safety for 17 years, since the publication of now discredited research by the gastroenterologist Andrew Wakefield.

But the belief that autism and vaccinations are linked continues to cause many parents to decide against having their children immunised. As a result there have been avoidable measles outbreaks, including one in the US last year, which began in Disneyland in California in December and led to school closures and quarantine measures. In all, 159 children were diagnosed with measles across 18 states. The repercussions continue, as US doctors attempt to bring in legislation to prevent parents opting out of vaccination for their children on the grounds of "personal belief", while activists accuse scientists of being in the pockets of drug companies.

The study is published in the Journal of the American Medical Association (JAMA). => A.Jain, et al. Autism Occurrence by MMR Vaccine Status Among US Children With Older Siblings With and Without Autism. – JAMA, 21 April 2015, 313(15):1534-1540. https://jamanetwork.com/journals/jama/fullarticle/2275444

It sought to find out whether children who had older siblings with autism and therefore were at higher risk than most, were more likely to develop an autistic spectrum disorder themselves after having the MMR jab. They found no association between the jab and autism, even among the high-risk children, and regardless of whether they had just the first shot, under the age of two, or the booster as well at around the age of five.

The study included anonymised data from 95,727 privately insured children from across the US, 2% of whom had an older sibling with an autistic spectrum disorder (ASD). The research team, led by Anjali Jain of the Lewin Group, Falls Church, Virginia, say that those families with a child already affected by autism may be less likely to have younger children vaccinated.

"Families with a child affected by ASD may be particularly concerned about reports linking MMR and ASD, despite the lack of evidence," they write. "Surveys of parents who have children with ASD suggest that many believe the MMR vaccine was a contributing cause."

Following up the children in the study, funded by US government institutions, the team found that 994 had been diagnosed with autism, with a higher proportion (6.9%) in the high-risk group with older siblings with ASD than among the majority (0.9%). But whether or not they had been given MMR vaccination did not make a difference.

"Controversy seems to follow autism like the tail on a kite," says an editorial in the journal by Bryan H King of the University of Washington and Seattle children's hospital. Since the 1950s, there have been disputes over what autism actually is and more recently there is the controversy over the rise in the

number of children diagnosed with what is now classified as a spectrum disorder, he writes. Each new prevalence estimate amplifies the urgency to better understand causation.

The reluctance of some parents to vaccinate the younger siblings of children with the disorder could make it appear that there is less autism among children given the jab - not more, he says.

"Even so, short of arguing that MMR actually reduces the risk of ASD in those who were immunised by age two years, the only conclusion that can be drawn from the study is that there is no signal to suggest a relationship between MMR and the development of autism in children with or without a sibling who has autism," he writes.

Autism occurrence by MMR vaccine status among US children with older siblings with and without Autism

JAMA, 21 April 2015; 313(15):1534–1540
doi:10.1001/jama.2015.3077 // https://jamanetwork.com/journals/jama/fullarticle/2275444

Abstract

Importance. Despite research showing no link between the measles-mumps-rubella (MMR) vaccine and autism spectrum disorders (ASD), beliefs that the vaccine causes autism persist, leading to lower vaccination levels. Parents who already have a child with ASD may be especially wary of vaccinations.

Objective. To report ASD occurrence by MMR vaccine status in a large sample of US children who have older siblings with and without ASD.

Exposures. MMR vaccine receipt (0, 1, 2 doses) after 1 year of age.

Main Outcomes and Measures. ASD status defined as 2 claims with a diagnosis code in any position for autistic disorder or other specified pervasive developmental disorder (PDD) including Asperger syndrome, or unspecified PDD (International Classification of Diseases, Ninth Revision, Clinical Modification 299.0x, 299.8x, 299.9x).

Results. Of 95 727 children with older siblings, 994 (1.04%) were diagnosed with ASD and 1929 (2.02%) had an older sibling with ASD. Of those with older siblings with ASD, 134 (6.9%) had ASD, vs 860 (0.9%) children with unaffected siblings ($P < .001$). MMR vaccination rates (≥1 dose) were 84% (n = 78 549) at age 2 years and 92% (n = 86 063) at age 5 years for children with unaffected older siblings, vs 73% (n = 1409) at age 2 years and 86% (n = 1660) at age 5 years for children with affected siblings. MMR vaccine receipt was not associated with an increased risk of ASD at any age. For children with older siblings with ASD, at age 2, the adjusted relative risk (RR) of ASD for 1 dose of MMR vaccine vs no vaccine was 0.76 (95% CI, 0.48-1.22; P = .25), and at age 5, the RR of ASD for 2 doses compared with no vaccine was 0.56 (95% CI, 0.30-1.04; P = .07). For children whose older siblings did not have ASD, at age 2, the adjusted RR of ASD for 1 dose was 0.91 (95% CI, 0.68-1.20; P = .50) and at age 5, the RR of ASD for 2 doses was 1.09 (95% CI, 0.76-1.54; P = .65).

Conclusions and Relevance. In this large sample of privately insured children with older siblings, receipt of the MMR vaccine was not associated with increased risk of ASD, regardless of whether older siblings had ASD. These findings indicate no harmful association between MMR vaccine receipt and ASD even among children already at higher risk for ASD.

The strange tale of GcMAF

WDDTY, 15 June 2015
https://www.wddty.com/features/the-strange-tale-of-gcmaf/

For a therapy that's been heralded as a cure for cancer, AIDS and autism, the baptism of GcMAF has been a fiery one. Its chief exponent, Dr Jeff Bradstreet, was found dead from a gunshot wound in 2015 – to this day his relatives suspect foul play – and its main manufacturer was jailed last November.

Studies showing the effectiveness of GcMAF, an immunotherapy treatment, have been denounced as bad science or even fraudulent, yet countering that are the thousands of testimonials from people who say they have been helped – even cured – by the therapy.

In sentencing David Noakes, who manufactured GcMAF in the UK, the judge was at pains to point out that the therapy "is not on trial." Noakes, who was sentenced to 15 months in prison after pleading guilty to four counts of manufacturing and selling an unlicensed product and one of money laundering, firmly believed the therapy had helped many people, but he had shown "a reckless disregard for the regulatory regime," said Judge Nicholas Lorraine-Smith.

The prosecution followed a three-year investigation by the UK Medicines and Healthcare Products Regulatory Agency (MHRA), which claimed Noakes had made £10 million (about $12.5 million) from the sale of GcMAF between 2012 and 2015, the year when regulators raided the Cambridgeshire, UK, manufacturing plant of his company Immuno Biotech, seizing product worth around £5.5 million ($7 million).

In a statement, the MHRA said there was no scientific evidence to support Noakes's claims that GcMAF was a 'miracle cure' for cancer, HIV and autism. It also claimed that Noakes had admitted it couldn't cure cancer, although in a separate statement, Noakes had said the admission was advised by his solicitors and had been part of a plea-bargaining negotiation.

In June 2015, just a few months after the MHRA raid, investigators from the US Food and Drug Administration (FDA) raided the Georgia clinic of Dr Jeff Bradstreet, who had been using GcMAF to treat more than 11,000 children with autism. His body was found a few days later, floating in a river in North Carolina, with one gunshot wound to the chest. Investigators said he had committed suicide, but his family hired independent forensic analysts who suspected foul play.

It's only natural

For a therapy that makes such enormous claims, and which – if true – would challenge the pharmaceutical industry, it's not surprising it has been mired in conspiracy theories, charges of fraud and even lawsuits.

GcMAF (Gc protein-derived macrophage activating factor) is a protein that is naturally produced by the body and plays an important role in the healthy functioning of the immune system, and especially in activated macrophages, the white blood cells that protect against cancerous cells, bacteria and 'foreign substances.'

The GcMAF theory postulates that people who are immunocompromised have low levels of the protein and are more susceptible to cancer, multiple sclerosis and other systemic conditions. Cancer cells produce an enzyme, nagalase, that shuts down macrophage activity, and so the typical cancer patient has high levels of nagalase and low levels of GcMAF.

This theory – and the discovery of GcMAF – is the work of Dr Nobuto Yamamoto, a biophysicist who announced his discovery in 1991 while working at Hahnemann Medical College (now Drexel University College of Medicine) in Philadelphia.

Starting in 2006, he began to publish papers suggesting that nagalase levels were an indicator of AIDS progression, and that GcMAF could destroy metastasizing (spreading) breast cancer cells, combat colorectal cancer and cure HIV.

The journals that had published these papers eventually withdrew them after receiving complaints they were unscientific. The Anticancer Fund, based in Belgium, criticized Yamamoto's report on treating eight colorectal patients because its measure of successful treatment was based purely on patients' levels of nagalase, and not tumor size, while the aggressiveness of the cancers was never disclosed.[1]

One paper escaped the purge. Yamamoto and his team treated 16 prostate cancer patients with weekly doses of 100 ng GcMAF for between 14 and 25 weeks and found that their nagalase levels had dropped, which, they concluded, "indicated these patients were tumor-free".[2]

In 2009, Yamamoto sold the patents for GcMAF to an Israeli biopharmaceutical company, Efranet Macrophage, which subsequently rebranded it as EF-022. But others started to take an interest in GcMAF, including David Noakes. Yamamoto said his patent lawyers had tried to sue Noakes, but he had 'escaped.' One of Noakes' associates was Dr Bradstreet, who was testing GcMAF as a therapy for autism.

Bradstreet, a neuroscientist and professor of child development at the Southwest College of Naturopathic Medicine in Arizona, had published an initial study showing that GcMAF lowered the nagalase levels of 40 autistic children – and, thus, according to Yamamoto's protocols, had reversed autism itself.[3] Immuno Biotech, Noakes's company, has claimed that 500 autistic children of the 3,500 treated with GcMAF made a full recovery, and Bradstreet said he had treated thousands of autistic children at his clinic until the FDA raid.

The Immuno Biotech website claims that 180 scientists have published 73 research papers on GcMAF, while the company has written 33 papers since 2012. At a conference in 2013, doctors had reported cases of complete remission even in patients with stage IV cancer, and those individuals who had never had chemotherapy were the most likely to survive.

Overall, the company claims a 25 percent success rate with autism, with many other chronic conditions – like herpes, acne, kidney disease, Crohn's disease and osteoporosis – also being reversed.

Milking it

The death of Bradstreet and imprisonment of Noakes might have heralded the end of the GcMAF saga, but it refuses to go away. In Japan – where yet another version of GcMAF is being produced and sold on the web – researchers and therapists continue to take a close interest in the protein and have published papers on their findings.

In one, researchers at Kagoshima University tested a 'second-generation' GcMAF – produced with cows' colostrum, the first form of milk all mammals produce after giving birth – on two patients with chronic fatigue syndrome, who they claim experienced a reduction in fatigue and pain.[4]

Colostrum MAF, as it's known, was also tested on a patient with multiple sclerosis, who showed improvements, especially in motor function.5 Combined with low-intensity ultrasound therapy, it also killed cancer cells in a 77-year-old man with lung cancer.6

Proponents of GcMAF describe it as the most powerful – and promising – immunotherapy treatment for cancer of them all. The thousands who have been treated with GcMAF – including hundreds of cancer sufferers on the island of Guernsey, where Noakes's Immuno Biotech company is based – would agree.

GcMAF could be another false trail in the long road to finding a cancer cure, but there's enough evidence out there that suggests it deserves a closer – and independent – look. But raiding offices and clinics, and seizing the products, isn't the best way of finding out.

How it works

GcMAF (Gc protein-derived macrophage activating factor) is a protein we produce in our bodies. It binds with vitamin D to help improve immune system response by activating macrophages, the white blood cells that kill bacteria and cancer cells and clean up cellular 'debris.'

But the protein doesn't operate alone; it needs vitamin D to help regulate it. The vitamin – and especially variants D3 and D2 – is vital for the healthy functioning of the immune system, and especially for the development of the central nervous system and neurological processes.

An enzyme called nagalase (alpha-N-acetylgalactosaminidase) can interfere with macrophage activity, and having a high nagalase level is a risk factor for many chronic conditions, including lupus and cancer.

GcMAF therapy blocks nagalase, allowing the body to start producing its own version of the protein and restore healthy immune function.

As well as supplementing with D3 – with anything from 10,000 to 20,000 IU every day – taking GcMAF may also work better when it's combined with oleic acid, a fatty acid found in meats, vegetables and milk.

The original GcMAF products were based on serum (blood), but later generations are instead produced using colostrum, the first milk produced by mammals after giving birth. Antibodies in the colostrum called immunoglobulins are also supposed to make the protein more effective.

Another GcMAF activator is yogurt. Dr John Gray – author of the best-selling book series *Men Are from Mars, Women Are from Venus* who now runs his own health center in California – advocates the use of Bravo Super Probiotic yogurt, as the product's 42 strains of probiotic bacteria have been "proven to produce the essential protein, GcMAF."

On June 19, 2015, Dr. Jeff Bradstreet reportedly shot himself in the chest after his offices were raided by U.S. FDA agents and State of Georgia law enforcement agents. Three days before his death, agents exercised a search warrant to gather information about the use of GcMAF with autistic patients in his clinic. Human GcMAF holds great promise in the treatment of various illnesses including cancer, autism, chronic fatigue and possibly Parkinson's. Since 1990, 59 research papers have been published on GcMAF, 20 of these pertaining to the treatment of cancer.

Dr Bradstreet was an alternative autism specialist and is widely regarded as a pioneer in the naturopathic field. He was using GcMAF and successfully treating dying cancer patients. To understand what put him on the deadly radar of the U.S. FDA and the pharmaceutical companies was that GcMAF has shown the ability to completely reverse autism and cancer without the use of chemotherapy, radiation, or surgery.

It's difficult to count how many other natural health practitioners involved with GcMAF (and other controversial therapeutics) had questionable life ending experiences during the same general 2015-ish time frame. I lost count around the 150 mark.

I still have to tolerate the rolling of eyes whenever these deaths are brought up, because it happened, but was only reported by Erin Elizabeth. The fact that medical examiners signed off on clearly suspicious deaths suggests the long arm of consulting firm black ops.

Famous autism researcher and Doctor, Jeff Bradstreet, MD, died of alleged "self inflicted gunshot wound" to chest and found in a river

Health Nut News, 23 June 2015
https://healthnutnews.com/famous-florida-autism-researcher-and-doctor-jeff-bradstreet-died-of-alleged-self-inflicted-gunshot-wound-and-found-in-a-river/

There are now 5 missing doctors (4 holistic & 1 osteopath) from the same region, and 5 more are missing, all within under a month.

From their Facebook page, the Bradstreet family has said they're "going to get to the bottom of this." They've started a GoFundMe page to help launch a thorough investigation to uncover whether or not foul play was involved. They've asked that people not speculate at this time. We hope they find out the truth. They deserve at least that. Our thoughts and condolences go out to his family, friends, patients, and many followers. =>
https://web.archive.org/web/20150627143820/http://www.gofundme.com/xscefs?fb_action_ids=10200851175799279&fb_action_types=og.shares

I'd heard about the raid on his office in Buford, GA, which happened just before his death but didn't write about it. Now that the Epoch Times has posted a tastefully written piece by an epidemiologist from AutismInvestigated.com, I feel I can share that information. There are speculations as to why the office was raided, but I'm not going to comment on that. I just know that Dr. Bradstreet helped many children who were his patients, and was loved by countless people, as evidenced by his memorial page on Facebook. He leaves behind a beautiful wife and family.

End of update.

I'm sad to report that two prominent doctors in the "alternative medicine" world have died in the past few days. The first was the accomplished, well known, and much loved Dr. Jeff Bradstreet MD**,** formerly of the East Coast of Florida, who'd since moved to Georgia.

Fox Carolina is reporting that his body was found in a river in North Carolina and that he died of an apparent "self-inflicted gunshot wound to the chest."

The funeral is in Shelby, North Carolina. Shelby is a small town of 20k people and where authorities recently apprehended Dylann Roof, the Charleston South Carolina mass church killer. Some doctors writing me tonight find the story suspicious. They're concerned. I'm concerned too; my other half is a prominent, controversial doctor as well. I suspect we'll know more as the investigation continues.

Another doctor (whose name I cannot yet disclose) died suddenly on Father's Day, here on Florida's east coast. *He too had a run-in with the feds, was investigated and charged*, but I'll elaborate on that in due time. This doctor was healthy and fit, with a thriving practice, and had an additional PhD in nutrition from Harvard. We're saddened by the sudden death of both doctors. Loved ones have already set up a memorial page for Dr. Bradstreet on Facebook. People who loved him are posting worldwide and thanking him for all he did during his amazing career. I haven't yet posted this article on Facebook, and haven't noticed any news coverage of the details I've found regarding his death.

From the article about Dr. Bradstreet's tragic death:

"The Rutherford County Sheriff's Office said they received a report about a body in the Rocky Broad River in Chimney Rock on June 19.

Deputies said the body was found by a fisherman. The body was removed from the river and was identified as James Jeffrey Bradstreet of Braselton, Georgia. Bradstreet had a gunshot wound to the chest, which appeared to be self inflicted, according to deputies.

Divers from the Henderson County Rescue Squad responded to the scene and recovered a handgun from the rivers, according to deputies.

Bradstreet's body was sent to Wake Forest Baptist Medical Center for an autopsy on Wednesday. The case remains under investigation."

We will update you as more information becomes available about the death of Dr. Jeffrey Bradstreet and of the other doctor whose name I can't yet share. More info is coming in at this late hour about the #CDCwhistleblower and from other sources I need to vet before posting (it's complicated). Our hearts go out to their families and friends during their time of loss.

Gwinnett Daily Post

Controversial autism researcher, Jeff Bradstreet, commits suicide after FDA raid in Buford, authorities say

Gwinnett Daily Post, 24 June 2015
https://www.gwinnettdailypost.com/archive/controversial-autism-researcher-jeff-bradstreet-commits-suicide-after-fda-raid-in-buford-authorities-say/article_f5192b34-9d05-504f-973a-4778728ede09.html

BUFORD – Dr. Jeff Bradstreet, an autism researcher hailed as a hero by some, dismissed as a fringe conspiracy theorist by others, is believed to have committed suicide following a visit to his Buford office by federal agents, authorities confirmed Thursday.

Multiple law enforcement officials said the U.S. Food and Drug Administration searched Bradstreet Wellness Center last week. On Monday, plastic sheets covered the windows of the two suites the office takes up in a complex off Commerce Drive, and the doors were locked.

Employees who answered the door said they couldn't give any information, that it was too soon to speculate on how he died. By Wednesday night, some of Bradstreet's supporters were speculating that his death wasn't a suicide, but a conspiracy.

The Rutherford County, N.C. Sheriff's Office says the doctor, 61, of Braselton, was found dead by a fisherman in the Rocky Broad River on Friday afternoon, not far from the lake Bradstreet and his wife often visited on vacation.

"Mr. Bradstreet had a gunshot wound to the chest, which appears to be self inflicted," a statement from the office said, adding that the investigation is ongoing.

The FDA has yet to reveal why agents searched the office of the doctor, reportedly a former pastor who has been controversial for well over a decade. Robert Hiser, an assistant special agent in charge with the federal agency's criminal investigations division, referred questions to the U.S. Attorney's Office in Atlanta, which couldn't immediately be reached Thursday.

The Georgia Drugs and Narcotics Agency aided the FDA with the raid, but director Rick Allen said Thursday he wasn't immediately able to give information on the purpose of the search.

Bradstreet has been criticized for using methods of treating autism that were dismissed by mainstream medical professionals. He has also been blasted for reportedly treating patients for "mercury toxicity," based on the belief that an ingredient in a childhood vaccination caused autism, a theory which the leading voices in medicine say is inaccurate.

As news of his death spread, many of his supporters began posting messages online, saying that he had saved their children's lives, that he was champion for the movement to cure autism. They posted story after story in which his therapies and drugs were successful.

Others, including a man who said he was his brother, called him a martyr for autism and insinuated that the truth about his death wasn't yet known. The man, Thomas Bradstreet, is shown as the creator an online fundraising page, asking for $25,000 from supporters for "Finding out the TRUTH."

More than $5,000 had been donated by shortly after noon Thursday.

Jamie Keever, the investigator from the sheriff's office on the case, said he was aware of the theories.

"I've talked to some of those people today," he said Thursday. "I don't know what to say. They have a right to their opinion."

Efforts to reach the Bradstreet family were not successful this week.

Doctor who Shined Light on Vaccine Injury Dies at 60

The Epoch Times, 25 June 2014 // Autism Investigated, 26 June, 2015
https://web.archive.org/web/20150628022510/http://www.theepochtimes.com/n3/blog/doctor-vaccine-injury-dies-60/
https://web.archive.org/web/20150628055507/http://www.autisminvestigated.com/doctor-vaccine-injury-dies-60/

It comes with great sadness to announce the untimely passing of Dr. Jeff Bradstreet, a medical doctor and parent of a child who developed autism after vaccination. Having once stated at a conference that "autism taught me more about medicine than medical school did," he has contributed heavily to the body of peer reviewed science implicating the vaccine schedule in autism's etiology.

He had produced research suggesting children with autism have a higher body burden of mercury as well as research detecting measles in a subset of children with regressive autism who received the live-virus measles, mumps and rubella vaccination. As such, he believed children who presented with these types of findings should be treated for them.

=> see: Bradstreet, et al. https://www.jpands.org/jpands0803.htm // https://www.jpands.org/vol8no3/geier.pdf
=> see: Bradstreet, et al. https://www.jpands.org/vol9no2/bradstreet.pdf

Dr. Bradstreet faced considerable scorn as a result of his research, practice and views.

In 2004 his work was dismissed by the Institute of Medicine, which was paid by the Centers for Disease Control and Prevention to produce a report rejecting any association between autism and vaccination. He was also ridiculed for mercury detoxification treatment by a special master in vaccine court, where email evidence has since shown that petitioners' attorneys advised by SafeMinds threw the case for the mercury-based vaccine preservative thimerosal causing the autism epidemic.

Then shortly after an FDA raid on his clinic in Buford, Georgia, Dr. Bradstreet was suddenly found dead. The FDA – which continues to maintain that thimerosal is safe despite contrary evidence produced by him and other researchers – would not comment on why its agents visited his clinic. An investigation is ongoing and a fundraising effort has been set up by his brother "To find the answers to the many questions leading up to the death of Dr Bradstreet, including an exhaustive investigation into the possibility of foul play."

In the meantime, his brother requested that people not spread rumors or gossip about Dr. Bradstreet's untimely death out of respect for his family. Autism Investigated will honor those wishes and will not approve any comments through moderation that do. May the circumstances surrounding Dr. Bradstreet's passing be revealed soon, and may Dr. Bradstreet's scientific contributions help lead to the end of the harm being done to so many children.

NBC NEWS

Anti-Vaccine Doctor Jeff Bradstreet Dead in Apparent Suicid

NBC News, 27 June 2015, 6:33 PM GMT+8
https://www.nbcnews.com/news/us-news/anti-vaccine-doctor-jeff-bradstreet-apparent-suicide-officials-n382981

Anti-vaccine doctor Jeff Bradstreet was found dead in an apparent suicide in North Carolina, officials said.

The Rutherford County Sherriff's Office said in a news release issued this week that Bradstreet died of what appears to be a self-inflicted gunshot wound to the chest.

He was found in a river in the Rocky Broad River in Chimney Rock on June 19 by a fisherman.

“The case is still under investigation,” the news release said

His family is raising funds online to investigate his death, the Associated Press reported.

Bradstreet ran a clinic in Buford, Georgia, and published autism research based on the claim that vaccines cause autism, the AP said.

The Gwinnett Daily Post in Georgia reported that U.S. Food and Drug Administration agents searched Bradstreet’s clinic on Monday, citing multiple law enforcement officials. That report could not immediately be verified by NBC News.

CBS News: Authorities: Anti-vaccine doctor dead in apparent suicide

CBS News, 27 June 2015, 10:46 AM CDT
https://www.wjtv.com/news/cbs-news-authorities-anti-vaccine-doctor-dead-in-apparent-suicide/

Chimney Rock, N.C. – Authorities say Dr. Jeff Bradstreet, who published research based on the medically disproved claim that vaccines cause autism, has been found dead in an apparent suicide in North Carolina.

The Rutherford County Sheriff's Office said in a news release issued this week that Bradstreet died of what appears to be a self-inflicted gunshot wound to the chest.

Bradstreet, who was from Braselton, Georgia, was found in the Rocky Broad River in Chimney Rock on June 19. His body was found by a fisherman. The sheriff's department said Tuesday that a handgun was also pulled from the river.

Authorities are still investigating.

Bradstreet ran a clinic in Buford, Georgia. He also owned Creation's Own, a maker of dietary supplements, which he also prescribed.

The Gwinnett Daily Post reports that agents from the U.S. Food and Drug Administration, aided by the Georgia Drugs and Narcotics Agency, raided the Bradstreet Wellness Center last week. The FDA did not reveal to the paper why agents had searched Bradstreet's office.

Bradstreet's family is now raising funds online to investigate his death, including "an exhaustive investigation into the possibility of foul play."

The Bradstreet Wellness Center's website describes the practice's focus as "treating children with Autism Spectrum Disorder, PPD, and related neurological and developmental disorders," through the use of measured biomarkers.

"Our mission is to positively impact children's lives by meeting their biological, behavioral, and nutritional needs," it states. "Properly identify and address the underlying issues so that the child's brain, gut and immune systems can begin to function and heal."

In 2009, the U.S. Court of Federal Claims, Office of Special Masters found Bradstreet's research claiming causation between autism and environmental mercury exposure, which were published in non-peer-reviewed journals, and his testimony about links between a young patient's autism and his MMR vaccination, to be unconvincing and unsupported by evidence.

The court's opinion also questioned Bradstreet's treatment of a Florida boy whose family had filed a claim under the National Vaccine Injury Compensation Program. Over several years, Bradstreet prescribed a variety of dietary supplements, "de-yeasting," secretin infusions, immunoglobulin therapy and chelation therapy, as well as numerous non-standard laboratory tests which were not FDA-approved.

The Washington Post

Anti-vaccine doctor behind 'dangerous' autism therapy found dead
Family cries foul

The Washington Post, 29 June 2015, 5:23 a.m. EDT
https://www.washingtonpost.com/news/morning-mix/wp/2015/06/29/anti-vaccine-doctor-behind-dangerous-autism-therapy-found-dead-family-cries-foul/

James Jeffrey Bradstreet's life was full of controversy. To thousands of supporters, he was a savior: a physician who claimed vaccines caused autism and promoted radical procedures to treat those afflicted, including his own son.

To many others, however, he was a crackpot: a man who, despite his medical license, ignored science and championed dangerous, discredited and occasionally deadly treatments.

It's no surprise, therefore, that Bradstreet's death is proving equally divisive.

On the afternoon of June 19, a fisherman spotted Bradstreet's lifeless body lying in the Broad River in the tiny town of Chimney Rock, N.C. He had a gunshot wound to his chest, authorities said. A gun was found in the water nearby.

That's about all that everyone can agree on.

Like his research, Bradstreet's death has become a Rorschach test in which his supporters see a conspiracy, while most everyone else – including law enforcement – sees slow downward slide towards suicide.

The Rutherford County Sheriff's Office said it is investigating Bradstreet's death, but that the wound appears to have been self-inflicted.

Bradstreet's family, however, has set up an online account to raise funds for "an exhaustive investigation into the possibility of foul play."

"Jeff dedicated his life's work to finding answers, always pushing the envelope, and never giving up, even at the risk of being perceived as controversial," wrote his niece, Cali Bradstreet Howell, on the gofundme Web site. "Now, in this moment, we find ourselves in a position, where we too are in search for answers … and we intend on finding them."

Bradstreet had been a leading voice in the anti-vaccine, or "anti-vaxxer," movement for nearly two decades.

He was a former preacher who traded the pulpit for a physician's gown, according to the Gwinnett Daily Post. Bradstreet received his medical degree from the University of South Florida and completed his residency at the Wilford Hall USAF Medical Center in Texas, according to a paper he wrote.

His interest in autism was as much personal as professional. He made no secret about the fact that family had been touched by the disorder. "Both [my] son and stepson have autism spectrum disorders and have experienced significant recovery as a result of intensive biomedical interventions," he claimed.

On his blog, Bradstreet detailed the painful story of how his own son's struggles had pushed him to study autism – and increasingly controversial therapies.

"It takes a lot of courage to face the world with autism," he wrote in a 2012 birthday letter to his autistic son:

From an easy pregnancy and simple delivery you progressed as a sweet and happy baby boy right up until 8 months when that first ear infection struck. It didn't want to go away easily and ultimately you needed tubes to drain the infection. Prior to that we tried a lot of antibiotics and none worked. We didn't realize back then that you had a primary immune deficiency and couldn't make enough IgM to defend your body.

I can't even talk about the next year and all the things that happened. But your mother and I had to watch our precious boy change without understanding what was happening. The first time you pulled the pans out of the kitchen cabinets and banged on them it was cute. The next 20 times it was obvious something was wrong. And then you just didn't seem to cry when you fell and hurt yourself. I had never seen that before.

The worst part of those early years was the horrific diarrhea that would actually burn your bottom within seconds. That was so sad and so hard to treat. Back in those days we understood so little about the gut connection to autism.

Ultimately, secretin (a simple hormone) give IV made a huge difference in that problem. It was an immediate change and even got you the attention of Bernie Rimland and the National Enquirer. Your response to secretin made you an immediate hit with about 10 million readers of the Enquirer and neither your nor my life has been the same since.

But as the National Enquirer coverage suggests, some of these treatments were salacious but scientifically iffy. (A 2012 study, for instance, found "no evidence that single or multiple dose intravenous secretin is effective" for treating autism.) Bradstreet also wrote about including his son in an intravenous immunogloblin (IVIG) trial that "made a huge difference." But another study found IVIG only helped 10 percent of patients and "should be undertaken only with great caution."

Nonetheless, his son's case helped convince Bradstreet that vaccines caused autism. He took his message to the highest levels of government. Twice he testified about the supposed link between vaccines and autism before the U.S. House of Representatives.

"He was a very happy, well connected child prior to his MMR at approximately 12 months of age," Bradstreet told representatives in 2002, presenting copies of his son's various tests. "Matthew completely lost about 2 months after his MMR vaccine."

From his clinic in Buford, Ga., Bradstreet treated patients from around the world, many who sought him out online. Desperate parents seeking answers for their children's maladies would write to him on his blog, begging him for help.

But leading autism experts say Bradstreet was simply wrong, and that the autism therapies he espoused were "dangerous."

"There is no evidence that vaccines cause autism," Peter Jay Hotez, dean for the National School of Tropical Medicine at Baylor College of Medicine, told The Washington Post. "It is pseudoscience based on a misunderstanding of the whole neurobiology of autism.

"But there are a lot of worrying conspiracy theorists that keep on making up allegations about vaccines," he said. "Every five years, the main variables change. I've seen about six iterations of this. As soon as one pseudoscience theory is debunked, someone comes up with something new."

Hotez, who also has a child with autism, said it was understandable that Bradstreet and others sought answers to the still somewhat mysterious disorder.

"If you Google something on the Web, you can get a quick and easy fix," he said. "Unfortunately that's what a lot of parents do, and there is a lot of garbage on the Internet."

Bradstreet's beliefs were doubly dangerous, Hotez said. Not only did they scare people off of vaccines – something that has led to a resurgence of measles in the U.S. – but the treatments themselves can also be deadly.

"Bradstreet was promoting chelation therapy, which is dangerous and without any benefit," Hotez said. Chelation involves the use of chemicals to remove metals from a patient's blood.

The U.S. Food and Drug Administration says chelation can be used in cases of acute poisoning, but Bradstreet believed the procedure could treat autism by removing mercury — supposedly introduced by vaccines — from an autistic person's blood.

The FDA, however, has warned against such "chelation therapies" for autism: "Chelating important minerals needed by the body can lead to serious and life-threatening outcomes."

"Chelation therapy never made any sense from a scientific standpoint," Hotez added. "So in the zeal to chelate mercury, which, again, there is no basis showing [it is the problem], Bradstreet would also chelate the calcium, and that would cause a very toxic reaction."

"Chelation is certainly not appropriate" for treating autism, Michael Katz, a senior adviser to the March of Dimes and professor emeritus at Columbia University, told The Washington Post. He added that numerous studies have debunked the link between mercury in vaccines and autism, rendering chelation pointless.

Bradstreet was also a believer in hyperbaric oxygen chambers and stem cell therapy for the autistic.

It is unclear what role Bradstreet's controversial research and therapeutic techniques might have played in his death. According to the Gwinnett Daily Post, the FDA and Georgia's Drugs and Narcotics Agency raided his Buford clinic in the days before his death.

"Multiple law enforcement officials said the U.S. Food and Drug Administration searched Bradstreet Wellness Center last week," the newspaper reported on June 26. "On Monday, [June 22] plastic sheets covered the windows of the two suites the office takes up in a complex off Commerce Drive, and the doors were locked."

It's still unclear why the raid was carried out. For many, however, the timing seemed to fit with the official explanation of a suicide. Bradstreet's body was found near where he and his wife vacation, the Daily Post reported. And, although less frequent than bullets to the head, suicide shots to the chest are not uncommon.

But Bradstreet's family and broad network of supporters see a nefarious scheme in the series of events leading to his death.

"He was a fighter and would never just quit," Bradstreet's former wife, Lori, wrote on the gofundme Web site. "What we were told happened really does defy all reason. Thank you for all your help to find the truth."

The Bradstreet family did not respond to multiple requests for comment.

"I can not accept the notion that Jeff would take his own life," wrote former colleague, John Reinhold Sr. "His research was a threat to many representing huge financial losses in the hundreds of billions, if the direction his research was validating came to be accepted as 'fact.' We discussed this many times when he was in the earliest stages of his work. The public is unaware of how easy it is for someone knowledgeable whose financial interests are threatened to make a phone call and simply state, 'He's an annoyance we don't need right now,' and that simple statement putting plans in motion. If Jeff's strong suspicions are right regarding cause and causes of autism, legal actions against those corporations implicated would be staggering and possibly unprecedented in the history of world finance. Jeff was brilliant and had every reason to live. Although we've not been in touch in recent years I can not fathom that he checked himself out."

Others expressed their thanks for the miracles that Bradstreet had allegedly worked upon their autistic children, while quickly decrying his "murder."

"I will always remember how helpful his office in Melbourne Fl. was to my very ill autistic child," Marla Peters wrote. "My daughter is now 19, she was 5 when we first went to his office. No one would help her with her gut pain but this group of Dr.s helped her and myself. Forever grateful and sad because his work was not done! May God have vengeance quickly on the evil doers who murdered him!"

"One of the best doctors my son had in 21 years," echoed Andrea Parker. "He did not kill himself! I simply don't believe it at all. He was super religious and had an Autistic son himself. This looks really dirty to me."

Hotez said passions run high in the autism debate. He and his family have received angry messages and e-mails but never death threats, he said.

And while he couldn't comment about Bradstreet's death, Hotez wondered if the homicide theories were, like vaccine conspiracies, half baked.

"There is a deep seated paranoia" in the anti-vaccine movement, he said. "There is a deep seated feeling that there must be something bad out there."

Medscape

Dr. Jeff Bradstreet Murder vs. Suicide: Media Spin Evidences Organized Crime

Med Scape, 2 July 2015
https://medicalveritas.org/dr-jeff-bradstreet-murder-vs-suicide-media-propaganda-evidences-organized-crime/

Dr. Jeff Bradstreet Murder vs. Suicide: The Washington Post, Historically a Mouthpiece for the CIA, Heralds "Anti-vaccine Doctor Behind 'Dangerous' Autism Therapy Found Dead. Family Cries Foul."

Foreword by
Dr. Leonard G. Horowitz

The following well-written article by Michael E. Miller, published by the *Washington Post,* is a classic study in social engineering using defamatory propaganda published to disparage the recently deceased Dr. Jeff Bradstreet on behalf of the *Post*'s leading advertisers–Big Pharma–that has historically played key roles in aiding-and-abetting genocide, mandatory vaccinations, and anti-trust violations in medicine while defrauding consumers and depriving people of their rights, informed consent, and even religious freedoms.

Miller's prose evidences a pattern of bias and commercial malice, punctuated by adjectives abused to discredit every aspect of the heroic Dr. Bradstreet's academic dedication, published science, and clinical success stories.

The Hegelian Dialectic Used in Counter-Intelligence

To see the forest of reality through the trees of counter-intelligence propaganda, you need to first understand the general persuasion technique called the "Hegelian Dialectic" that the "news media" applies in circumstances such as this. When protection against threatened revolution is needed; when a defense against heroes, like Dr. Bradstreet, are required to squelch voices loud enough to "make a difference" in health science and clinical practice; and when alternative views of life and health endanger the petrochemical status quo, behavioral science is applied to media spin, to news "programming," to shape minds, beliefs, attitudes, and political actions to the detriment of truth and reason in medicine and civilization.

The Hegelian Dialectic applies a "thesis," followed by its "antithesis," yielding "synthesis." In this case, the *Post*'s "thesis" is that Dr. Bradstreet was a quack; the antithesis is that Bradstreet was a hero in the world of autism and "alternative medicine." The social engineering outcome is called "synthesis"–mass confusion about the safety and efficacy of lower cost less risky approaches to healthcare, and diversion from the underlying medical monopoly and commercial conspiracy.

This is how Big Pharma's "protection racketeering" is administered; whereby opposition to "slash, burn, and poison medicine" is squelched by defaming parties threatening the drug cartel. The media, by omissions and misrepresentations, commits consumer fraud in this way. Media spins effectively influence and engineer society to accept deadly doctrines, and indoctrinate generations into a "health science cult."

That cult argues that anything other than what the "gods of science" espouse from corporate-controlled institutions of "higher learning" is "pseudoscience" and "dangerous."

"The 'smoking gun' in this case is the FDA's armed intrusion into Dr. Bradstreet's clinic only days before his death–a clear and convincing assault against the doctor's health freedom and professional reputation in retaliation for Dr. Bradstreet's well-founded opposition to the vaccine industry's liability for creating generations of brain damaged victims."

Fraudulent Concealment of Evidence of Assassination in the *Post*'s Spin

Dr. Bradstreet's most probable assassination is evidenced by the bias expressed by the *Post*, and other "mainstream media" sources of counter-intelligence propaganda. Bradstreet had achieved academic and medical prominence, and was capable of changing minds and scientific paradigms to advance medicine beyond Big Pharma's fixation on intoxicating pharmacology (i.e., drugs and vaccines that cause horrible side effects).

If investigators were to discover a smoking gun beside a murder victim they would be liable for negligence, cover-up, or even complicity in the murder if they were to claim the gun contained only blanks, and swept away evidence of the suspect leaving the scene of the crime.

The "smoking gun" in this case is the FDA's armed intrusion into Dr. Bradstreet's clinic only days before his death–a clear and convincing assault against the doctor's health freedom and professional reputation in retaliation for Dr. Bradstreet's well-founded opposition to the vaccine industry's liability for creating generations of brain-damaged genetically-mutated victims.

Miller's article is akin to sweeping the evidence of crime under the carpet, and then claiming the murder victim killed himself because he was mentally ill. According to the *Post*, Bradstreet "ignored science and championed dangerous, discredited, and occasionally deadly treatments."

Miller's libel disparaging the victim creates the diversion and alibi. Miller quoted, Peter Jay Hotez, dean for the National School of Tropical Medicine at Baylor College of Medicine, saying "There is no evidence that vaccines cause autism. . . . It is pseudoscience based on a misunderstanding of the whole neurobiology of autism."

Miller did not disclose Hotez's bias and conflicting interest. Baylor College of Medicine has a long history of infamy in advancing the cancer industry best exposed by investigator Ed Haslem. Haslem's father, a Harvard-educated naval officer introduced his son, the author of *Mary, Ferrie, and the Monkey Virus*, to the secret world of biological warfare and CIA operations at the Alton Ochsner Clinic in New Orleans. The operation Haslem discovered was fundamental to the cancer industry, pioneering genetically engineered viruses for genocide; and administering covert operations, arson, and murders linked to New Orleans assigned special agent, Lee Harvey Oswald, whose CIA involvement in the Kennedy assassination has been corroborated by numerous reputable authors.

"[T]here are a lot of worrying conspiracy theorists that keep on making up allegations about vaccines," Hotez said. "Every five years, the main variables change. I've seen about six iterations of this. As soon as one pseudoscience theory is debunked, someone comes up with something new."

The Double-sided Deadly Misrepresentations in the Post's Yellow Press Evidence Complicity and Cover-up in the Murder

"If you Google something on the Web, you can get a quick and easy fix," Hotez said. "Unfortunately that's what a lot of parents do, and there is a lot of garbage on the Internet."

"Bradstreet's beliefs were doubly dangerous," Hotez continued. "Not only did they scare people off of vaccines – something that has led to a resurgence of measles in the U.S. – but the treatments themselves can also be deadly."

"Pseudoscience" and "deadly treatments"–the pot calls the kettle black. Ask Hotez to cite one double blind case control study of the long term effects of vaccination poisoning with deadly viral recombinants (GMOs) now used in Monsanto's foods and Pfizer's vaccines and you have gross hypocrisy fouling Miller's article. (Note: Pfizer owns Monsanto.)

"Bradstreet was promoting chelation therapy, which is dangerous and without any benefit," Hotez said.

"Chelation involves the use of chemicals to remove metals from a patient's blood," Miller misrepresented.

In fact, the most commonly used medical chelation agent is not a "chemical," but a mineral, naturally sourcing from lava rock. It is called zeolite. And there is nothing "dangerous" or toxic about zeolite's widespread use in medicine and natural healing by well educated and responsible physicians, contrary to Miller's misrepresentations and Hotez's libel.

Likening Hotez's narrative to hostile witness testimony, Hotez's story is unreliable, incongruous, and clearly malicious. Hotez's testimony reads like he celebrates Bradstreet's death, as though Bradstreet was his enemy. Hotez expresses a criminal "condition of mind" consistent with retaliation and motivation for murder.

Next witness . . .

"Chelation is certainly not appropriate" for treating autism, Michael Katz, a senior adviser to the March of Dimes and professor emeritus at Columbia University, told The *Washington Post*.

Katz added that numerous studies have debunked the link between mercury in vaccines and autism, rendering chelation pointless.

On cross examination, numerous studies have also confirmed mercury in vaccines' link to autism, and the March of Dimes' link to spreading cancer viruses and epidemics of cancer worldwide through their polio vaccine "eradication program" that transmitted the SV40 virus–the fortieth money virus ever discovered that was determined to cause cancer in virtually every species injected.

The *Washington Post* and the CIA

Moreover, as a witness, or reliable source of intelligence, Michael Katz, is grossly discredited by his association with Columbia University–New York's mecca for CIA-academia–graduating leading agents assigned to direct intelligence and counter-intelligence in the spook worlds of health science, geopolitics, and population policies consistent with the global financial agendas of the Carlyle Group and Rockefeller family.

During the Ebola emergency of 2014, for instance, the *Post* assigned pro-war "psychopath," rookie journalist Terrence McCoy, to troll for the National Security Agency, according to evidence of the company's actions witnessed worldwide on the Internet. McCoy's bio precisely fit the m.o. of a C.I.A. propagandist, including "voluntary" "Peace Corps" service coupled with "training" at New York's Columbia University, infamous for rearing "The Company's" best assets, including "Wild Bill" Donovan, the "father of the Central Intelligence Agency," who operated on behalf of the Rockefeller family, and graduated from Columbia Univ. Law School. And Carlyle Group Chairman, past CIA Deputy Director, and National Security Advisor under the Reagan Administration, Frank Carlucci, III, was replaced by Columbia University's mega-donor, Louis V. Gerstner. Carlucci served as under secretary of the Department of Health, Education, and Welfare (1972-74), the precise time that HIV/AIDS was loosed in New York's gay male population and Willowbrook State School for the mentally retarded according to massive scientific evidence.

Columbia University's complicity in biomedical racketeering, especially in the cancer industry, is heavily supported by the "generosity," of the Louis V. Gerstner family and the Louis V. Gerstner, Jr. Foundation. A "Gerstner Award program" began in 2008, courtesy of Gerstner, the retired chairman and CEO of IBM, and most influential member of the board of advisers in Columbia University's College of Physicians and Surgeons.

Gerstner, chief of "war racketeering" for the Carlyle Group, recently replaced Frank Carlucci, III, whose CIA record, pursuant to HIV/AIDS and Ebola "outbreaks" in Africa, is shocking and neglected by *The Washington Post*. (Carlucci directed the Agency's African operations from his posts in Portugal and the Congo, including "Peace Corp" infiltrations for intelligence gathering and covert ops, according to detailed accounts in *Emerging Viruses: AIDS & Ebola–Nature, Accident, or Intentional?*

The Washington Post–best known for heralding Watergate – now publishes a propaganda campaign against Dr. Bradstreet dirtier and more transparent than the one launched to discredit me and my politically-explosive *Emerging Viruses book.*

Suffice it to say that Dr. Katz shames Columbia University's name by concealing his gross bias and conflicting financial interests while berating dead doctor Bradstreet.

Niin, Neuvostoliitossakin kerrottiin yhta ja toista, mutta pitaisiko kaikki niella purematta? Usan judehallituksen ja-organisaatioiden tiedotteet seka "tutkimukset" eivat oikein vakuuta.

Käytit itse tuota samaa sivustoa lähteenä. Oliko ne autismilukematkin manipuloituja lukuja?
Jos päättää olla uskomatta vaikkapa tähän tutkimukseen ja samaan aikaan pitää Jim Stonea luotettavana lähteenä, ei se mua haittaa, mutta ei kannata pitää lainkaan yllättävänä sitä, ettei sanoma oikein uppoa. => https://pubmed.ncbi.nlm.nih.gov/23545349/
Tutkimuksia on enemmänkin. The Guardian kertoo Journal of the American Medical Associationissa julkaistusta tutkimuksesta, jossa seurattiin 95 000 lasta ja joka toteaa saman asian: yhteyttä ei ole.
=> https://www.theguardian.com/society/2015/apr/21/no-link-between-mmr-and-autism-major-study-concludes
Jos löytyy kausaliteetin todistavia vertaisarvioitua tutkimuksia, ne voi toki lyödä tässä vaiheessa pöytään.

Palle kirjoitti:
Voittehan te rokottaa itsenne ja lapsenne reikia tayteen, ei se minua haittaa, mutta me kriittiset jatkamme pohdintoja.
Tässä ketjussa "kriittisyys" näyttää lähinnä sokealta uskolta omaan asiaan.

Mielipiteensä kullakin. Usan hallitus ja virkamiehistö väärentää ja sensuroi kuitenkin häikäilemättä tutkimustuloksia ja tutkimuksia joissa todetaan autismin ja rokotusten yhteys, kuten tässä:
NaturalNews did a report about an intercepted CDC e-mail which blew the lid off the vaccine autism scam, *which proves the CDC covered up the vaccine autism link.* Sure enough, the report the CDC mail referred to got censored practically instantly after NaturalNews published it, but I have it here below. Perhaps this will put pressure on the censors to make this available again.

The actual censored text Natural News no longer has a link to:

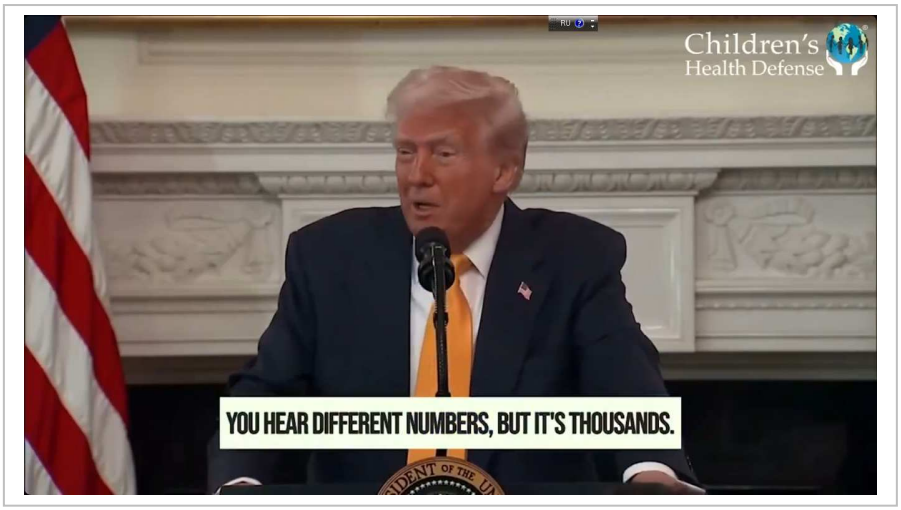
How to Address the Autism Epidemic
Two Key Targets: Childhood Hyper-Vaccination and Toxic Pesticide Exposure

Focal Points, 25 February 2025
https://www.thefocalpoints.com/p/how-to-address-the-autism-epidemic?img=https%3A%2F%2Fsubstack-post-media.s3.amazonaws.com%2Fpublic%2Fimages%2Ff2850339-1bac-4006-b5b6-ccf2e6a4d759_1000x666.jpeg&open=false

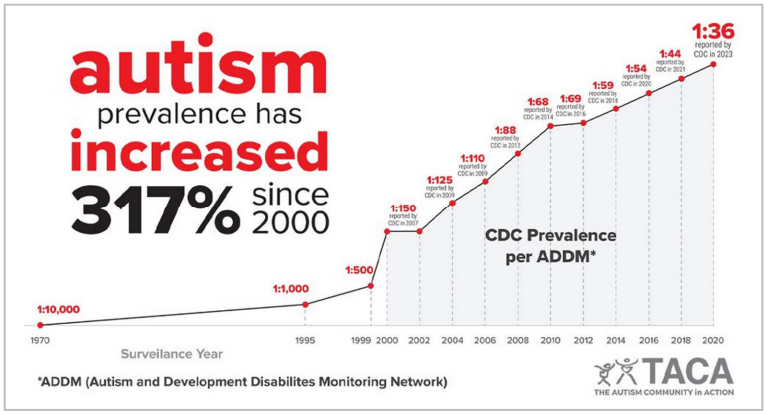
A few days ago, President Trump delivered the following remarks:



You know, we have one stat that I quote, the autism stat … if you go back 15 years ago, we had like nobody. It was 1 in 20,000. Now we have 1 in 34 … So 34 or 36 kids have autism. And if you go back … 18 years, whenever that was done, it was 1 in 20,000.

So we got from 20,000 to 34-36. That's unbelievable. So there's something wrong …We've done something wrong. There's something you're going to figure it out.

Maybe it's a spray that we spray all over the place that nobody else does – Other countries don't. The Pennsylvania Dutch [Amish], they don't do anything. And they're amazingly healthy.



President Trump is correct – the CDC estimates that 2.78% of children and 2.21% of adults have autism in America.

A 2010 study titled Prevalence Rates of Autism Spectrum Disorders Among the Old Order Amish estimated that ASD affected approximately 1 in 271 children in the Amish community. This is significantly lower than the CDC's 2010 estimate for the general U.S. population, which was 1 in 68 children. Why do Amish children fare better than others? And why is the autism rate in America continuing to skyrocket with no end in sight? We now have abundant evidence that the following factors should be key targets in addressing the autism epidemic:

TARGET #1 - Childhood Hyper-Vaccination

As of 2025, the CDC recommends that children receive up to 32 doses by age 2. This represents a massive increase in recommended vaccine doses since the inception of the 1986 National Childhood Vaccine Injury Act giving vaccine makers full liability protection:

RECOMMENDED DOSES

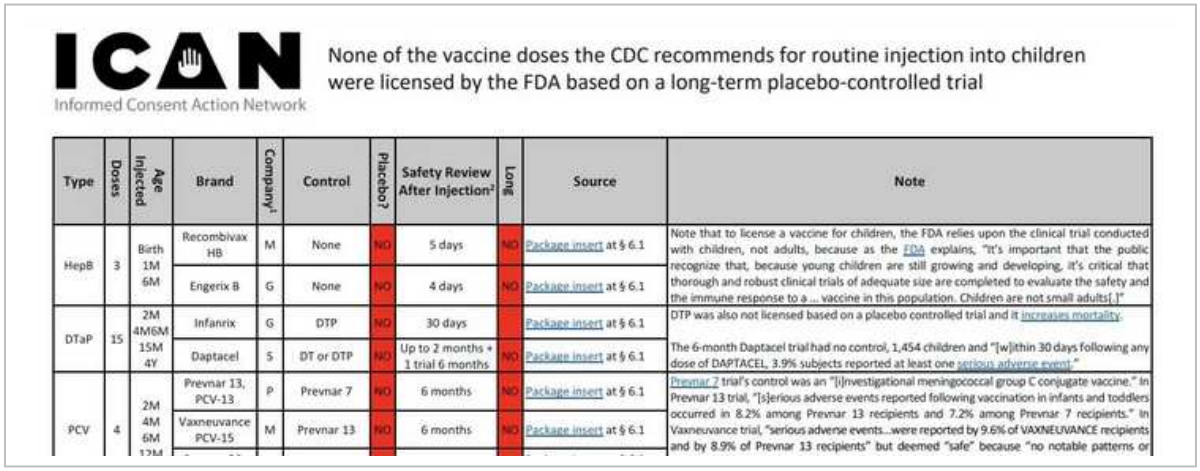
Since they enjoy full liability protection, pharmaceutical companies currently get their injections approved with no long-term, placebo-controlled trials:



ICAN
Informed Consent Action Network

None of the vaccine doses the CDC recommends for routine injection into children were licensed by the FDA based on a long-term placebo-controlled trial

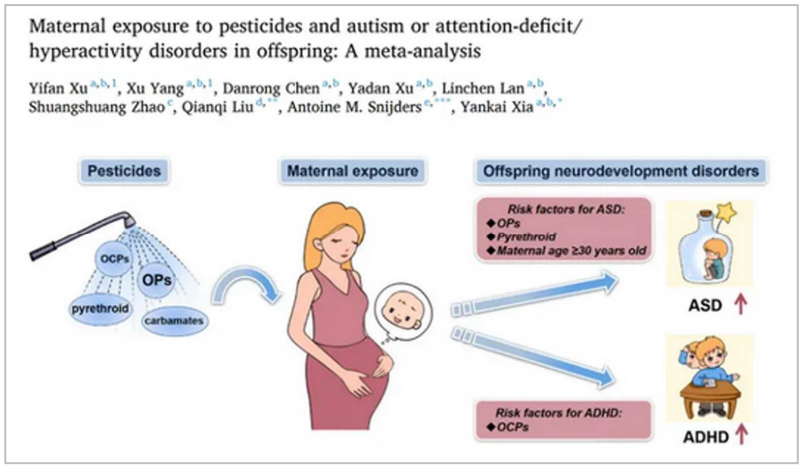
TARGET #2 - Pesticides

As President Trump stated, “Maybe it's a spray that we spray all over the place.”

The Association Between Pesticides and Autism

Nicolas Hulscher, MPH

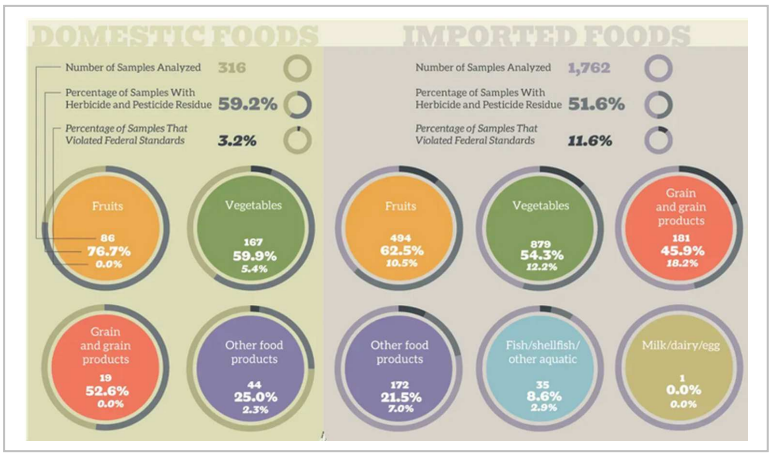
November 16, 2024



By Nicolas Hulscher, MPH

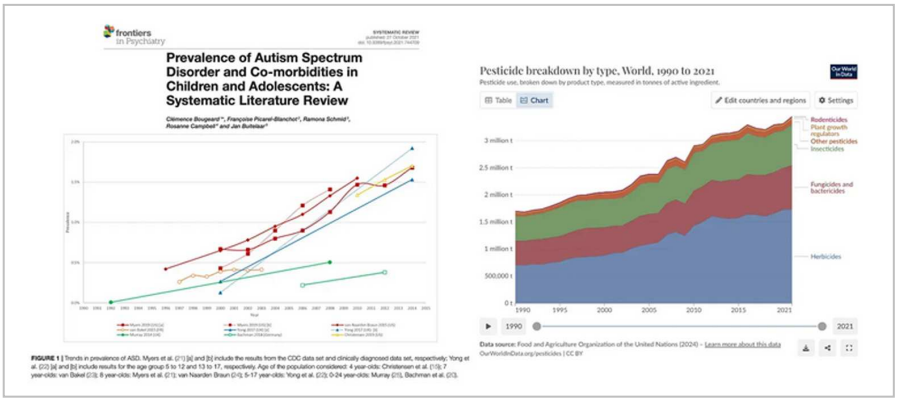
=> https://www.thefocalpoints.com/p/the-association-between-pesticides

The FDA 2020 Pesticide Residue Monitoring Report “tested for approximately 750 different pesticides and selected industrial compounds on 2,078 human food samples (316 domestic and 1,762 import samples) in its regulatory monitoring program.” Nearly 60% of all domestic foods contained herbicide and pesticide residue, with 3.2% violating federal standards. 11.6% of all imported foods violated federal standards for pesticide residues:



DOMESTIC FOODS
Number of Samples Analyzed 316
Percentage of Samples With Herbicide and Pesticide Residue 59.2%
Percentage of Samples That Violated Federal Standards 3.2%
Fruits 86 76.7% 0.0%
Vegetables 167 59.9% 5.4%
Grain and grain products 19 52.6% 0.0%
Other food products 44 25.0% 2.3%
IMPORTED FOODS
Number of Samples Analyzed 1,762
Percentage of Samples With Herbicide and Pesticide Residue 51.6%
Percentage of Samples That Violated Federal Standards 11.6%
Fruits 494 62.5% 10.5%
Vegetables 879 54.3% 12.2%
Grain and grain products 181 45.9% 18.2%
Other food products 172 21.5% 7.0%
Fish/shellfish/ other aquatic 35 8.6% 2.9%
Milk/dairy/egg 1 0.0% 0.0%

Since 1990, autism rates have skyrocketed along with pesticide use:



A 21-year case-control study by Roman et al found a 34% rise in ASD prevalence rate in regions with elevated pesticide use compared to regions with low use [OR: 1.34, 95% CI: 1.24–1.44].

Pu et al found that the exposure to high levels (0.098%) glyphosate during pregnancy and lactation caused ASD-like behaviors in male juvenile offspring (mice).

A meta-analysis by Xu et al included 19 studies and found maternal pesticide exposure was associated with a 19% increased risk of ASD in offspring [pooled OR = 1.19, 95% CI: 1.04-1.36].:

lton et al. (2014) 1.57 (0.82, 3.00) 3.13

These data suggest that restructuring the CDC's childhood hyper-vaccination schedule and drastically limiting toxic pesticide use should be two priority targets in addressing the autism epidemic. A comprehensive, science-driven investigation into these factors is urgently needed to protect future generations.

AAPS Association of American Physicians and Surgeons

Public Health Watch:
Is There a Vaccine-Autism Connection?

AAPS, 13 March 2025
https://aapsonline.org/public-health-watch-is-there-a-vaccine-autism-connection/

Are you completely convinced of the safety and effectiveness of the childhood vaccine schedule, or do you think additional research is justified?

The Centers for Disease Control and Prevention (CDC) is gearing up to study the links between vaccines and autism. Some, including Sen. Bill Cassidy (R-La.), have called this a waste of scarce resources, like studying whether the earth is flat or whether Elvis is still alive.

The whole concern about MMR and autism is believed to have originated in a 1998 paper in *The Lancet* by Dr. Andrew Wakefield and 12 others. The journal retracted the paper 12 years later, and the British General Medical Council revoked Dr. Wakefield's medical license.

Dr. Wakefield was not the first person to suggest an association, and hundreds of thousands of parents have reported that their normally developing child suddenly regressed (losing eye contact, speech, motor skills, etc.), often after a well-baby visit that involved "baby shots."

Nearly 90% of autism cases may be regressive, according to a 2018 study by Ozonoff, et al., a fact not compatible with a genetic cause. => https://pubmed.ncbi.nlm.nih.gov/29524310/ Rather, it implicates a sudden toxic exposure. (Exposure to microplastics or common foods is not sudden.)

Autism is one of many conditions found to be far more prevalent in vaccinated children (see graph) in a 2017 study by Mawson et al. https://x.com/RCarter69938/status/1872314776250171819 =>

Children's Health Defense

Unquestionably, the diagnosis of autism is being made far more frequently – it may be as high as 1 in 25 children in some areas. The burden of needed social services will become even more crushing when the children's parents die. A $1.6 trillion/year tsunami has been suggested.

Some studies have found a vaccine connection; others have not. Should we toss out all the positive ones as flawed, as Sen. Cassidy has suggested? Or pursue all avenues to investigate the cause of this overwhelming catastrophe?

Big Brother's Coming!
Revealed: Secret plan to tag every man, woman and child

The Sun, 1 August 1989, p. 15
https://www.instagram.com/p/CSX6x9qtZvN/
http://www.whale.to/vaccine/frick.html

Coded Microchips implanted in every person in the country would tie all of us into a master computer that could track anyone down at any moment, and plans for such a system are already under way whether you like it or not!

The secret scheme is being touted as a service for the protection of the people by high government officials, but some insiders who object to the move say it's just another way for Big Brother to control its subjects.

Transmitters

"Top-level national security agents are trying to convince sources in the Bush Administration to begin the project in which every man, woman and child will be implanted with a tiny transmitter," claims Davis Milerand, a critic of government intervention who says he has received leaked information from inside sources.

"They're trying to say this will be a good way for authorities to quickly track down missing persons and children, as well as criminals and spies.

Injections

"But with the astounding technology of today, everything about you could be contained in one tiny microchip, which would be connected to a government computer."

"Any government agency will know what any person has done and is doing at any time."

Other sources say the tiny transmitters can be injected painlessly from a tiny gun in humans without them even knowing it through a nationwide vaccination program.

"All the government would have to do is make up something like the swine flu vaccine," Milerand says.

"Imagine if they said there was a vaccine for AIDS. People would rush in droves to get shots.

"The doctors themselves may not even know what they're injecting. They could be told the microchips are genetic implants that reprogram the body into fighting disease."

He adds: "The program would require all federal, state and local government workers to undergo the injections."

"It would be only a matter of time before everyone is implanted with a microchip, a slave the goverment."

No-sleep diet keeps you wide awake

IF YOU THINK there just aren't enough hours in the day, you can now get added time — thanks to a revolutionary new sleep method that helps people stay up nearly all night.

The new sleep system is called "Micro-Somnia," and it's billed as "The Entrepreneur's Guide to Sleep Reduction" by sleep management researcher Benjamin Plumb of Miami.

Plumb gets only 4½ hours of sleep each night and has a few brief catnaps during the day.

He says that through Micro-Somnia he hopes to introduce short sleep "as a safe viable tool for people to use in increasing productivity."

Writes

The researcher cut red meat out of his diet, eats less gooey sweets, takes daily naps and avoids doing high-impact exercises in his leisure time.

He eats stuff like beans, rice and tofu, and does light exercises like walking and yoga.

Besides his prescribed diet and exercise regimen, the tireless sleep expert says he writes down his goals for the next day before retiring for the night — so he'll wake up excited the next morning.

Plumb says his brand of sleep management is only for "highly motivated, extremely goal-driven adults" because children and pregnant women require more sleep for health reasons.

Some super successful people like Winston Churchill, Napoleon and Thomas Edison worked wonders while catching only a few winks a night, he notes.

But they were born short sleepers and their nocturnal habits came naturally.

Now, however, Plumb says his program can make short sleepers out of sleepaholics who spend nine or 10 hours each night huddled under the covers.

He figures the best customers for his Micro-Somnia technique are corporate types who'd rather be awake pursuing their goals than wasting their time on sleep.

THE FLU CASE

Flashback:

UK newspaper reports on plan to chip people under swine flu jab pretext in 1989

The Flu Case, 3 November 2009

https://web.archive.org/web/20091108013313/http://www.theflucase.com/index.php?option=com_content&view=article&id=1572:flashback-uk-newspaper-reports-on-plan-to-chip-people-under-swine-flu-jab-pretext-in-1989&catid=1:latest-news&Itemid=64&lang=en

The UK newspaper "The Sun" carried a prophetic report on 1. August 1989 with the headline "Big Brother's Coming" outlining secret government plans to implant microchips, also under the pretext of a swine flu pandemic, into every person in order to obtain total control of populations.

The report could have been written today as governments prepare to implement mass "swine flu" vaccinations with an untested and toxic jab and many sources say there will be a nanochip in the syringes to be issued by governments.

The Economist

Changing your Genes

The Economist Magazine. 25 April 1992
1992 Apr 25; 323 (7756):11-12. PMID: 16001470
https://pubmed.ncbi.nlm.nih.gov/16001470/

Biology is destiny." Though the years have been unkind to Sigmund Freud's thought, that notion sounds fresher now than when he said it. In the 1950s the threads of destiny were given form when Francis Crick and James Watson elucidated the double-helix structure of DNA. In the 1960s the language of genes, in which the messages stored on DNA are written, was translated; biology, and much else, began to change. Genes are blamed for everything from cancer to alcoholism. People worry about being made ineligible for jobs because of disease susceptibilities they never knew they had; fetuses are aborted because of faults in their genes; criminals are defined by the bar-codes of their genetic fingerprints.

Gene Therapy

At first glance, genetic therapy – the nascent art of giving sick people new genes to alleviate their illness – looks like the apotheosis of this trend towards reducing human life to a few short sequences of DNA. But although its advent means people will be talking in the language of genes even more than they already do, the way they talk will change. They will not be passively reading out the immutable genetic lore passed down from generation to generation. They will not be receiving orders; they will be giving them. The birth of genetic therapy marks the beginning of an age in which man has the power to take control of his genes and make of them what he will.

At the moment, gene therapy is a small field on the fringes of medicine and biotechnology. Genes carry descriptions of proteins, the molecules that do most of the body's work; if someone is missing a gene, they will be missing a protein, and may thus suffer a deficiency or disease. If a gene or set of genes runs amok, cancer can result. The gene-therapists aim to provide the body with genes to make good its deficiencies and problems. If their field had grown as fast as the stacks of ethical reports and regulatory procedures that surround it, it would already be big business. As it is, after years of discussion, it is only now starting to blossom. Therapies are being tried on people around the world (though in tiny numbers) and new ways of delivering genes are being devised. A torrent of raw material for tomorrow’s therapies is flowing from the human genome programme, which plans to have a description of every gene and every scrap of DNA found in the body by the early years of the next century.

Many hear echoes of eugenics at every mention of the gene, and look at this progress with fear. Present research, though, provides no cause for alarm, just an occasion for the routine caution with which all medical advances must be treated. From one point of view, gene therapies are transplants; from another, they are just drug treatments with the added twist that the drug is being made inside the body. There already exist sets of rules for trying out drugs. The question of the drug's provenance is of secondary importance, as long as its manufacture can be shown to be safe. Experimental gene therapy has satisfied regulators on that count, so far.

"So far,’ though, is only the beginning, Beyond today's gene therapy, which is a specialised form of medicine not that dissimilar to others, lie far more controversial possibilities: changing genes for non-medical reasons, and changing genes wholesale in such a way that the new genes are passed on from generation to generation, At present, therapists aim at genes that are clearly villains, and the therapies last at most as long as the patient, and often only as long as a transient set of cells. But what of genes that might make a good body better, rather than make a bad one good? Should people be able to retrofit themselves with extra neurotransmitters, to enhance various mental powers? Or to change the colour of their skin? Or to help them run faster, or lift heavier weights?

Humans Make Choices

While the dilemmas of genetic research give many reasons to pause and reflect, they do not justify slowing or stopping the research itself. In many cases, the best way to eliminate dilemmas – and protect human life – is to push back genetic frontiers. Admittedly, there are risks involved. The more we master genes, the more options – many of them morally questionable – we will have. But making choices, after all, is what being human is all about.

Joel L. Swerdlow, Моя Quarter, Spring 1992.

Yes, they should. Within some limits, people have a right to make what they want of their lives. The limits should disallow alterations clearly likely to cause harm to others. Even if the technology allowed it, people should not be allowed to become psychopaths at will, or to alter their metabolism so that they are permanently enraged, Deciding which alterations sit in this forbidden category would have to be done case by case, and in some cases the toss may be passionately argued. But so it is with all constraints on freedom, Minimal constraint is as good a principle in genetic law as in any other.

People may make unwise choices. Though that could cause them grief, it will be remediable. That which can be done, can be undone; people need no more be slaves to genes they have chosen than to genes they were born with. To keep that element of choice, however, one thing must be out of bounds. No one, should have his genes changed without his informed consent; to force genetic change on another without his consent is a violation of his person, a crime as severe as rape or grievous bodily harm. There may be subtle social pressures to choose certain traits; but there is often social pressure for all sorts of things, and it does not deny the subject free will.

God and Nature

Some will object, in the names of God and nature, Religious beliefs may strongly influence people's decisions about what, if any, engineering they undergo. They should not be allowed to limit the freedoms of unbelievers, In that it uses natural processes for human ends, gene therapy is as natural, or as unnatural, as most medicine. But even the artificial carries no moral stigma, The limits imposed by nature are practical, not moral. The body does not have infinite capacities – gains in one ability usually mean losses in others. Natural selection always seeks to fit the balance of abilities to a given environment, and abilities it has optimized may prove hard to enhance. Substantial improvements in human intellect, for example, may not be possible using genes alone.

All this refers to the engineering of cells in the bulk of the body, "somatic" cells which pass no genes to the next generation. But to influence the early development of embryos, or to create radically different types of persons, requires a different approach, one that puts new genes into all cells – including the eggs and sperm, whence they can launch themselves into the next generation. This sort of "germ-line" therapy, with its long-term effects, brings to mind spectres of master races and *Untermenschen* that limited cell therapy does not.

One response to these worries, used by many scientists in the field, is to say that germ-line therapy is not an option. Prospective patients may disagree. Some conditions, which do their nasty work on small embryos, may for all practical purposes be treatable only by using germ-line therapy. As yet, no therapy for such conditions has been devised. If it is, it would not necessarily be ruled out; but it would be right to regulate it far more closely than regular, somatic-cell therapy. Germ-line therapy ‘would be similar to major surgery on an unborn child incapable of informed consent, In such cases, it is commonly accepted that the parents are justified in acting in the child’s interests. If they can show they are undeniably doing so, there similarly seems no ground for denying the gene therapy. But that undeniable interest will have to be the avoidance of a clear blight that would prevent the child, if not treated, from ever being able to take a similar decision about its future.

If somatic-cell therapy becomes common, if biological understanding becomes far more profound and if people show an abiding interest in transforming themselves, then a less conservative approach may prevail – not least because people would know that a child with genes foisted on it by its parents might be able to change them itself, come the time. In such a world, changing children may look less worrying: or it may look unnecessary, Not all change is genetic. Surgery can transform people too, as many transsexuals will testify; increasing intelligence may be easier with prosthetic computers than with rewired brains. The proper goal is to allow people as much choice as possible about what they do. To this end, making genes instruments of such freedom, rather than limits upon it, is a great step forward. With apologies to Freud, biology will be best when it is a matter of choice.

Abstract

(EN) A vaccine comprising an antigen derived from a zona pellucida glycoprotein is effective to impair fertility in animals, preferably carnivores. The vaccine can be used as an immunosterilant or an immunocontraceptive.

(FR) L'invention concerne un vaccin comprenant un antigène dérivé d'une glycoprotéine de l'aire pellucide, ce vaccin permettant d'inhiber la fécondité chez les animaux, de préférence carnivores. Ce vaccin peut être utilisé comme immunostérilisant et comme immunocontraceptif.

Antibodies to squalene in Gulf War syndrome.

Exp Mol Pathol, 2000 Feb; 68(1):55-64.
doi: 10.1006/exmp.1999.2295. PMID: 10640454.

Abstract

Gulf War Syndrome (GWS) is a multisystemic illness afflicting many Gulf War-era veterans. The molecular pathological basis for GWS has not been established. We sought to determine whether the presence of antibodies to squalene correlates with the presence of signs and symptoms of GWS.

Participants in this blinded cohort study were individuals immunized for service in Desert Shield /Desert Storm during 1990-1991. They included 144 Gulf War-era veterans or military employees (58 in the blinded study), 48 blood donors, 40 systemic lupus erythematosus patients, 34 silicone breast implant recipients, and 30 chronic fatigue syndrome patients. Serum antibodies to squalene were measured.

In our small cohort, the substantial majority (95%) of overtly ill deployed GWS patients had antibodies to squalene. All (100%) GWS patients immunized for service in Desert Shield/Desert Storm who did not deploy, but had the same signs and symptoms as those who did deploy, had antibodies to squalene.

In contrast, none (0%) of the deployed Persian Gulf veterans not showing signs and symptoms of GWS have antibodies to squalene. Neither patients with idiopathic autoimmune disease nor healthy controls had detectable serum antibodies to squalene. The *majority of symptomatic GWS patients had serum antibodies to squalene*.

Rebecca Carley

Statement before the New York State Assembly Health Committee on the Model Emergency State Health Powers Act (MESHPA)

LinkNY, 14 March 2002

https://web.archive.org/web/20121211173658/http://web.linkny.com/~civitas/CPHArticles/page26.html

I am Dr. Rebecca **Carley**, a licensed medical doctor from Long Island who has been specializing in VIDS (Vaccine Induced Diseases Syndromes) for the past 5 years. I am here to tell you why I am uniquely qualified to advise you of the impending public health disaster you will precipitate if you sign on to this far reaching health powers act, knowing that there are 3 things insurance companies have totally abandoned coverage: acts of God, nuclear war and nuclear power plant accidents and vaccination.

I have developed a protocol to detox vaccine toxins and repair damaged body systems with nutritional supplements, and I have successfully reversed autoimmune diseases such as autism, asthma, allergies, leaky gut syndrome, etc. in many hundreds of patients, and I am not alone. Dr.Tinus Smits (www.tinussmits.com/english/pvs) coincidentally started using the same homeopathic detox techniques as I use overseas in what he calls PVS (Post Vaccination Syndrome), and he is having equally excellent results treating autoimmune disorders.

Dr.Michael Goldstein, a veterinarian from NYS, uses the same technique in pets as we use in people, and he is reversing cancer, behavioral abnormalities and other immune malfunction in animals, *Our combined work proves that vaccines are actually causing the epidemic of autoimmune diseases and cancer in the world today*. The rates of these diseases are escalating exponentially as the immunological assaults via inoculation in school age children increases in number.

Additionally, I am attaching a letter written by Canadian researcher Rita Hoffman to the Immunization Safety Review Committee at the Institute of Medicine in Washington,DC, documenting approximately 30 studies reported recently in mainstream medical journals such as JAMA, Pediatrics, Pediatric Allergy & Immunology, and International Archive of Allergy & Immunology documenting the obvious association of vaccines with anaphylaxis, asthma and allergies.

There are also many researchers, such as Dr.Andrew Wakefield and Dr.V.Singh demonstrating anti-myelin antibodies and digestive tract pathologies in children with autism after being given the MMR vaccine; as well as Dr. Harold Buttram linking vaccines to SIDS and cases of alleged "shaken baby syndrome." The common pathway for all the autoimmune and neurological VIDS that mounting evidence is now proving, is that when you get injected with foreign protein particles of RNA and DNA , the foreign proteins attach themselves to your own host cell proteins. It forms what is called an "antigenic complex," which the immune system now recognizes that the whole complex as foreign, and it mounts what is called an autoimmune response against the entire complex (including the host cell proteins), where antibodies you produce now attack YOU.

When an honest evaluation of the medical literature is done, it becomes obvious that vaccines did not actually cause the decline in communicable diseases; but rather, said decline occurred as a result of sanitation reforms and nutritional improvements. W.John Martin, one of the world's leading vaccine contamination analysts in charge of testing human vaccines for contamination between 1976 and 1980 at the FDA, Bureau of Biologics, testified at the trial of Dr.Guylaine Lanctot, Canadian physician and author of " The Medical Mafia," who was brought up on charges, as happens in this

State as well on a regular basis for speaking out against vaccinations. Dr.Martin gave trial testimony (as he did in the forward to the book "Emerging Viruses" by Dr. Leonard Horowitz) saying that those vaccines carried major contaminants that can not only cause cancer in your lifetime; but they may also be transmitted through the gene line to your children or your children's children, or even environmentally to cause cancer.

Neil Z. Miller reports in his book "Vaccines;are they really safe and effective?" (click to order from Civitas) that smallpox was actually kept alive and spread by vaccinations. Dr.Edward Jenner, given credit for developing the smallpox vaccine in the early 1800's, admitted that smallpox was relatively unknown before he began vaccinations.1 Before England passed a compulsory vaccination law in 1853, the highest death rate for any two year period was only 2,000 cases, even during the most severe epidemics.2 After more than 15 years of mandatory smallpox vaccinations, the number of deaths increased to 23,000 from smallpox. in the years 1870 and 1871. An Increase of over Eleven times that prior to compulsory vaccination 3 It was Adolph Hitler who said "If you tell a lie long enough, the people will believe it; and the greater the lie, the more people will believe it." The phrase that comes to mind is "vaccinations are safe and effective." Never has a greater lie been told.

The alleged smallpox bioterrorist attack that we have been told is coming is very likely to have a genetically engineered virus to make it resistant to known vaccines and treatments. Without sound scientific evidence proving these untested vaccines to be safe and effective, then legally and ethically, this vaccine would have to be considered experimental. The mandated use of the untested vaccine, must then be viewed as a state enforced national scientific experiment in violation of the nuremburg code, and god's laws. The proposed smallpox vaccine, as many others, will actually involve injection of viruses grown in lung tissues from aborted fetuses, into those opposed to abortion.

This legislation raises more questions than it answers.Why are criminal penalties being considered for refusal of people who weigh the risks and alleged benefits and then refuse to be inoculated? Why are doctors who, after taking an oath to "first do no harm";who decide they cannot in good conscience participate in what is surely to become known as "the greatest public health debacle in history," being threatened with loss of their medical license if they do not participate in this vaccine holocaust? It is political interference with patient care to override a physician's considered judgment that a vaccine for smallpox or anthrax is medically contraindicated.

Comments from Sandy Mintz:
http://www.vaccinationnews.com

If vaccines work, then why is quarantine being considered for individuals who have no disease, but refuse vaccination?

As a matter of fact, since the vaccine can cause smallpox and its spread, it is the vaccinated, not the unvaccinated who should be quarantined. Since the Department of Defense has stated that there are over 65 agents that can be used for biological warfare; how does the government know that smallpox is coming?

Why is the State Militia being given the power to force vaccination, or quarantine of citizens and seizure of their property? What is the difference between such action and what went on in nazi germany? In fact, the systemic biologic assault of New York State citizens and the American people under such police powers with an untested vaccine is by definition: state sponsored bioterrorism. in fact it is painfully obvious that this law is actually creating a national scientific experiment, as per USC,Title 50,Chapter 32, Section 1520 & 1524. As I stated this is a violation of the Nuremberg Code.

If this model law is passed by this legislature, this will be practicing medicine without a license, and a violation of your oaths of office. The proposed law states "except in cases of gross negligence or willful misconduct, state actors are immune for death or injury to person or damage to property." Unless this panel or one of the "public health officials" being appointed can prove that the information I am submitting is NOT true; to pass such a law WILL be gross negligence; if not Treason.

I ask you to search your conscience, and stand up for the truth; regardless of the pressure being put on you by the military-industrial-medical complex. The future of humanity (including your loved ones), as well as our freedoms, is at stake with this draconian bill. In my expert medical opinion, such a bill is immoral, unethical and a total violation of our Constitutional Rights. // Sandy from Alaska // http://www.vaccinationnews.com

The Guardian

Antony Barnett

Much of Britain was exposed to bacteria sprayed in secret trials

The Guardian, 21 April 2002, 10.23 BST
https://www.theguardian.com/politics/2002/apr/21/uk.medicalscience

The Ministry of Defence turned large parts of the country into a giant laboratory to conduct a series of secret germ warfare tests on the public.

A government report just released provides for the first time a comprehensive official history of Britain's biological weapons trials between 1940 and 1979.

Many of these tests involved releasing potentially dangerous chemicals and micro-organisms over vast swaths of the population without the public being told.

While details of some secret trials have emerged in recent years, the 60-page report reveals new information about more than 100 covert experiments.

The report reveals that military personnel were briefed to tell any 'inquisitive inquirer' the trials were part of research projects into weather and air pollution.

The tests, carried out by government scientists at Porton Down, were designed to help the MoD assess Britain's vulnerability if the Russians were to have released clouds of deadly germs over the country.

In most cases, the trials did not use biological weapons but alternatives which scientists believed would mimic germ warfare and which the MoD claimed were harmless. But families in certain areas of the country who have children with birth defects are demanding a public inquiry.

One chapter of the report, 'The Fluorescent Particle Trials', reveals how between 1955 and 1963 planes flew from north-east England to the tip of Cornwall along the south and west coasts, dropping huge amounts of zinc cadmium sulphide on the population. The chemical drifted miles inland, its fluorescence allowing the spread to be monitored. In another trial using zinc cadmium sulphide, a generator was towed along a road near Frome in Somerset where it spewed the chemical for an hour.

While the Government has insisted the chemical is safe, cadmium is recognised as a cause of lung cancer and during the Second World War was considered by the Allies as a chemical weapon.

In another chapter, 'Large Area Coverage Trials', the MoD describes how between 1961 and 1968 more than a million people along the south coast of England, from Torquay to the New Forest, were exposed to bacteria including e.coli and bacillus globigii , which mimics anthrax. These releases came from a military ship, the Icewhale, anchored off the Dorset coast, which sprayed the micro-organisms in a five to 10-mile radius.

The report also reveals details of the DICE trials in south Dorset between 1971 and 1975. These involved US and UK military scientists spraying into the air massive quantities of serratia marcescens bacteria, with an anthrax simulant and phenol.

Similar bacteria were released in 'The Sabotage Trials' between 1952 and 1964. These were tests to determine the vulnerability of large government buildings and public transport to attack. In 1956 bacteria were released on the London Underground at lunchtime along the Northern Line between

Colliers Wood and Tooting Broadway. The results show that the organism dispersed about 10 miles. Similar tests were conducted in tunnels running under government buildings in Whitehall.

Experiments conducted between 1964 and 1973 involved attaching germs to the threads of spiders' webs in boxes to test how the germs would survive in different environments. These tests were carried out in a dozen locations across the country, including London's West End, Southampton and Swindon. The report also gives details of more than a dozen smaller field trials between 1968 and 1977.

In recent years, the MoD has commissioned two scientists to review the safety of these tests. Both reported that there was no risk to public health, although one suggested the elderly or people suffering from breathing illnesses may have been seriously harmed if they inhaled sufficient quantities of micro-organisms.

However, some families in areas which bore the brunt of the secret tests are convinced the experiments have led to their children suffering birth defects, physical handicaps and learning difficulties.

David Orman, an army officer from Bournemouth, is demanding a public inquiry. His wife, Janette, was born in East Lulworth in Dorset, close to where many of the trials took place. She had a miscarriage, then gave birth to a son with cerebral palsy. Janette's three sisters, also born in the village while the tests were being carried out, have also given birth to children with unexplained problems, as have a number of their neighbours.

The local health authority has denied there is a cluster, but Orman believes otherwise. He said: 'I am convinced something terrible has happened. The village was a close-knit community and to have so many birth defects over such a short space of time has to be more than coincidence.'

Successive governments have tried to keep details of the germ warfare tests secret. While reports of a number of the trials have emerged over the years through the Public Records Office, this latest MoD document - which was released to Liberal Democrat MP Norman Baker - gives the fullest official version of the biological warfare trials yet.

Baker said: 'I welcome the fact that the Government has finally released this information, but question why it has taken so long. It is unacceptable that the public were treated as guinea pigs without their knowledge, and I want to be sure that the Ministry of Defence's claims that these chemicals and bacteria used were safe is true.'

The MoD report traces the history of the UK's research into germ warfare since the Second World War when Porton Down produced five million cattle cakes filled with deadly anthrax spores which would have been dropped in Germany to kill their livestock. It also gives details of the infamous anthrax experiments on Gruinard on the Scottish coast which left the island so contaminated it could not be inhabited until the late 1980s.

The report also confirms the use of anthrax and other deadly germs on tests aboard ships in the Caribbean and off the Scottish coast during the 1950s. The document states: 'Tacit approval for simulant trials where the public might be exposed was strongly influenced by defence security considerations aimed obviously at restricting public knowledge. An important corollary to this was the need to avoid public alarm and disquiet about the vulnerability of the civil population to BW [biological warfare] attack.'

Sue Ellison, spokeswoman for Porton Down, said: 'Independent reports by eminent scientists have shown there was no danger to public health from these releases which were carried out to protect the public.

'The results from these trials_ will save lives, should the country or our forces face an attack by chemical and biological weapons.'

Asked whether such tests are still being carried out, she said: 'It is not our policy to discuss ongoing research.'

Биотерроризм: национальная и глобальная угроза

Вестник Российской Академии Наук, 2003, том 73, № 3, с. 195-204.
http://vivovoco.astronet.ru/VV/JOURNAL/VRAN/BIOTERROR.HTM

Онищенко Геннадий Григорьевич - академик РАМН, первый заместитель министра здравоохранения, главный государственный санитарный врач.

Сандахчиев Лев Степанович - академик, генеральный директор ГНЦ вирусологии и биотехнологии "Вектор".

Нетесов Сергей Викторович - член-корреспондент РАН, директор НИИ молекулярной биологии ГНЦ вирусологии и биотехнологии "Вектор".

Мартынюк Раиса Александровна - кандидат биологических наук, заместитель генерального директора по координации НИОКР ГНЦ вирусологии и биотехнологии "Вектор".

Угроза биотерроризма, разбуженная 11 сентября 2001 г. атаками на Нью-Йорк и Вашингтон, стала реальностью после того, как в почтовой системе США были скрытно распространены письма с возбудителями сибирской язвы. В результате этой акции умерли пять человек, включая троих, непосредственно контактировавших с зараженной почтой, более 20 были инфицированы и несколько тысяч человек вынуждены принимать сильные антибиотики. Письма, содержащие споры возбудителя сибирской язвы или их имитаторы, обнаружены в десятках других стран, включая Россию. Последний случай инфицирования сибирской язвой через письмо зарегистрирован 31 октября 2001 г. в одном из госпиталей Нью-Йорка [1].

Анализ исторических данных показал, что, как всякий терроризм, биотерроризм имеет политико-идеологические корни. Характер преследуемых целей и задач – борьба за власть и политико-экономическое влияние в современном мире -требует от террористов XXI столетия осуществления глобальных акций, способных самым серьезным образом воздействовать на население и правительства разных стран. В принципе, это тот же террор, только его инструментом служат биологические агенты, среди которых - возбудители особо опасных инфекций. Фактически, меняются форма и масштаб, сущность террора остается прежней.

В истории человечества сохранились сведения о применении биологических агентов во время захватнических войн, следствием чего были опустошающие эпидемии чумы и оспы. Так, в 1346 г. по приказу хана Золотой Орды Тохтамыша в колодцы и другие источники воды в осажденной генуэзской крепости Каффу (нынешняя Феодосия) в Крыму забрасывались трупы людей и животных, погибших от бубонной чумы. В итоге Каффа сдалась, но чума распространилась по всей Европе, вызвав страшную эпидемию, которая унесла жизни 25 млн. человек, что соответствовало примерно 10% населения тогдашнего мира. В 1422 г., в период религиозной войны в Чехии, в битве за Карлштейн тела зараженных чумой солдат бросали в шеренги противника. Подобные эпизоды отмечались и в 1710 г., во время войны России со Швецией. При колонизации Америки среди индейских племен неоднократно распространялась оспа. Например, в 1763 г. белые колонисты вероломно передавали им в знак дружбы зараженные одеяла, что привело к гибели миллионов индейцев, не имевших иммунитета к такому опасному заболеванию, как оспа. Позднее тем же приемом воспользовались британские солдаты для истребления коренного населения Америки [2]. И во время войны Франции и Индии (1754-1767) вирус оспы применялся с целью уничтожения противника [3].

В XX в. развернулись исследования по разработке высокоэффективного химического и биологического оружия для военных целей. Однако, в отличие от химического оружия, в прошлом столетии биологическое оружие использовалось крайне редко. Документально подтверждено лишь применение Японией возбудителей чумы и других бактериальных агентов против Китая в ходе Второй мировой войны [4]. Подписание в 1972 г. конвенции о запрещении биологического оружия значительно уменьшило потенциальную опасность его применения.

Согласно исследованию, проведенному американскими учеными в 1994 г., со времени окончания Первой мировой войны произошло более 244 инцидентов использования биологического и химического оружия [5]. Позднее были идентифицированы еще 110 подозрительных эпизодов, когда террористы или члены криминальных групп использовали, приобретали, угрожали либо проявляли интерес к биологическому оружию [6]. Случаи применения биологических агентов в террористических целях, с точки зрения нынешней трактовки терроризма, единичны. До недавнего времени единственным доказанным случаем считалось заражение салата в барах одного из американских городов в 1984 г., когда в приправу к салатам была добавлена *Salmonella typhimurium* [7].

Эксперты прогнозировали возрастающую угрозу биотерроризма задолго до событий 11 сентября 2001 г. В докладе Службы внешней разведки России за 1993 г. отмечалось:

"Наметившаяся тенденция к широкому распространению биотехнологий (имеющих, как правило, двойное назначение), трудности контроля за производством и применением биологических агентов и токсинов увеличивают вероятность использования биологического оружия (БО) странами «третьего мира» в локальных военных конфликтах, а также в диверсионных и террористических целях" [8].

При этом подчеркивалось преимущество биологического оружия перед ядерным и химическим: имеется возможность нанести серьезный ущерб экономике противника путем изначально скрытого применения биологического оружия против сельскохозяйственных растений и животных. Такие акции могут проводиться и в целях "экономической войны".

Если потенциальные агенты химического оружия хорошо изучены и для большинства из них разработаны методы противодействия, то в отношении биологических агентов ситуация качественно другая. Важно понимать, что биологические агенты действуют не сразу, имеют инкубационный период заболевания, в течение которого носитель может оказаться в совершенно других от первоначального места распространения биологических агентов географических условиях. Случаи подобного рода очень трудно выявить и отличить от природной вспышки, поэтому для доказательства биотеррористической природы вспышки требуется всесторонний эпидемиологический анализ, который может занять много времени. В упоминавшемся нами случае заражения салатов сальмонеллой только через год было доказано, что это - террористический акт, а общественность США узнала об инциденте лишь спустя много лет [9].

Нельзя также забывать, что окружающая нас природа - неисчерпаемый источник микроорганизмов - вирусов, бактерий и грибов, вызывающих заболевания человека, растений и животных. Всемирная организация здравоохранения (ВОЗ) считает инфекционные заболевания второй ведущей причиной смертности и первой причиной преждевременной смертности в мире. Согласно оценкам ВОЗ, ежегодно 2 млрд. людей болеют инфекционными заболеваниями, 17 млн. из которых умирают; ежедневно 50 тыс. смертей являются следствием инфекционных болезней и половина населения планеты находится под угрозой эндемических заболеваний [10].

Имеются и другие причины, по которым биологические агенты могут быть предпочтительными для террористов. Прежде всего это доступность, простота в изготовлении, удобство в хранении и транспортировке, а также возможность скрытого применения. Угроза биотерроризма требует от здравоохранения исключительно высокого уровня готовности к обнаружению наиболее опасных агентов и ликвидации последствий их преднамеренного использования.

В настоящее время ни одна страна не способна в достаточной степени противодействовать биотеррористической угрозе. По мнению ВОЗ, во всем мире система общественного здравоохранения ведет борьбу с естественно возникающими инфекциями на пределе своих возможностей, и дополнительная биотеррористическая угроза может привести к тому, что эта система будет не в состоянии с ней справиться. Уязвимость общества к биологическим агентам объясняется главным образом тем, что система медико-санитарной помощи не способна на данном этапе их своевременно обнаружить и предпринять необходимые меры защиты. Согласно рекомендациям ВОЗ, чтобы повысить готовность общественного здравоохранения к отражению биологической угрозы в той или иной стране, следует сосредоточить усилия на обучении персонала по программе, включающей ограниченную, но правильно выбранную группу биологических агентов. Это позволит создать необходимый потенциал для борьбы с более широким спектром патогенов [12].

Существуют различные списки агентов биологического оружия или потенциально опасных биологических агентов. Исторически потенциальная опасность патогенов оценивалась в интересах военных действий, а не биотеррора. Однако мирное население отличается от военных формирований. Для населения характерны широкий возрастной диапазон и большой разброс в состоянии здоровья, поэтому последствия биологической атаки для него могут быть сильнее, чем для военных формирований. Мирное население более уязвимо к биологическим агентам, содержащимся в питьевой воде и продуктах питания.

На встрече экспертов по инфекционным заболеваниям, проведенной в 1999 г. в Центре по контролю за инфекционными заболеваниями США, были рассмотрены ранее составленные списки потенциально опасных биологических агентов и разработаны общие критерии отбора тех из них, которые представляют наибольшую опасность при биотеррористической атаке. Отобрано около 40 биологических агентов (вирусы или группы вирусов, бактерии, риккетсии, грибы и токсины) и сформированы три категории A, B и C, включающие агенты по степени значимости угрозы для мирного населения [13]. Приводим распределение опасных биологических агентов по категориям [14].

Категория А

Bacillus anthracis (сибирская язва), *Clostridium botulinum* (ботулизм), *Yersinia pestis* (чума) *Variola major* (оспа натуральная) и другие покс-вирусы, *Francisella tularensis* (туляремия) Вирусные геморрагические лихорадки, вызываемые: аренавирусами (ЛХМ вирус, Хунин вирус, Мачупо вирус, Гуанарито, лихорадка Ласса), буньявирусами (хантавирусы, лихорадка долины Рифт) флавивирусами (Денге) филовирусами (Эбола, Марбург)

Категория В

Burkholderia pseudomallei (мелиоидоз), *Coxiella burnetti* (лихорадка Ку), *Brucella species* (бруцеллез), *Burkholderia mallei* (сап), *Ricinus communis* (токсин Рицин), *Clostridium perfringens* (Эпсилон токсин), Стафилококковый энтеротоксин В, *Rickettsia prowazekii* (сыпной тиф).

Патогены, угрожающие пищевой и водной безопасности: Бактерии *(E. coH* - диарея, холерные вибрионы, шигеллиозы, сальмонеллезы, *Listeria monocytogenes* - листериоз, *Campylobacter jejuni* - энтерит, *Yersinia enterocolitica* - энтерит), вирусы *(Caliciviruses,* гепатит А) простейшие *(Cryptosporidium parvum* - диарея, *Cyclospora cayatanensis* - диарея, *Giardia lamblia* - энтерит, *Entamoeba histolytica* -амебиаз, *Toxoplasma* — токсоплазмоз, *Microsporidia* — микроспоридии) дополнительные вирусные энцефалиты (вирус лихорадки Западного Нила, Ла Кросс, Калифорнийский энцефалит. Венесуэльский энцефаломиелит лошадей, Восточный энцефаломиелит лошадей. Западный энцефаломиелит лошадей, вирус японского энцефалита, вирус болезни леса Кьяссанур).

Категория С

Вирусы клещевых геморрагических лихорадок (вирус Конго-Крымской геморрагической лихорадки), Вирусы клещевых энцефалитов, Желтая лихорадка, Устойчивые к лекарствам, формы туберкулеза, Грипп, Риккетсиозы, Бешенство.

В 2002 г. этот список был использован Национальным институтом аллергии и инфекционных заболеваний, одним из ведущих в США в области изучения инфекционных агентов, при разработке краткосрочного и долгосрочного планов исследований по противодействию терроризму. Оценка опасности биологических агентов как средств терроризма против гражданского населения проводилась по следующим критериям:

•высокая заболеваемость и смертность;

• потенциал для непосредственной трансмиссии от человека к человеку либо через переносчика;

• низкая инфекционная доза и высокая инфекционность аэрозоля, способная вызывать большие вспышки;

• способность контаминировать продовольственные и водные ресурсы;

• отсутствие специфических диагностических тестов и/или эффективного лечения;

• отсутствие безопасных и эффективных вакцин;

• потенциал вызывать страх у населения и медицинских работников;

• потенциал для использования в качестве биологического оружия.

Агенты, отнесенные к категории А, представляют наибольшую угрозу для мирного населения. Их применение может привести к массовым жертвам, а некоторые из них, например оспа и чума, способны поставить под угрозу функционирование всего государства. Вирус натуральной оспы считается самым опасным из-за своих патогенных и эпидемических свойств [15]. За всю историю человечества оспа унесла около полумиллиарда человеческих жизней - больше, чем войны и прочие эпидемии вместе взятые [2].

Большинство предпринимаемых ныне мер ориентированы на защиту мирного населения именно от агентов, относящихся к категории А. Однако необходимо помнить, что в качестве биологического оружия можно использовать и обычные микроорганизмы, например, сальмонеллы, легионеллу или вирус гриппа, которые способны надолго вывести из строя большую часть населения страны, подорвать экономику государства. К такому выводу исследователи пришли на основе изучения пяти вспышек инфекционных болезней, недавно имевших место в различных странах. Санитарно-эпидемиологические службы и органы здравоохранения этих стран не смогли адекватно отреагировать на резкий прирост заболеваемости [16].

Крайне опасно использование в террористических целях агентов "возникающих инфекций". По оценкам экспертов, нам известно не более нескольких процентов существующих вирусов и чуть большая доля бактерий, а природа постоянно создает новые патогены. Только за последние 40 лет открыто и идентифицировано более 30 новых инфекционных агентов, среди которых ВИЧ, вирусы Марбург и Эбола. Для этих заболеваний не разработаны средства лечения и профилактики. Ряд возникающих и вновь появляющихся патогенов, таких как вирус Западного Нила, лекарственно устойчивые *Streptococcus, Staphylococcus* и *Mycobacterium tuberculosis,* также могут быть опасными биологическими агентами [9].

Значительную угрозу представляют и химерные организмы, сконструированные с помощью простых генетических манипуляций. На конференции, прошедшей в Бельгии в ноябре 2001 г., ученые пришли к выводу, что пандемию гриппа можно вызвать искусственным путем. По мнению доктора Р. Бебстера - директора Сотрудничающего центра ВОЗ по изучению экологии гриппа у животных и птиц - террористы вполне могут инициировать вспышку гриппа. Возможности современной биотехнологии позволяют создать вирус гриппа того типа, который наблюдался в 1919 г. и вызвал многомиллионные смерти во всем мире [17]. В противовес этим угрозам должны быть разработаны методики выявления таких искусственно созданных агентов и специфические средства для профилактики и лечения вызываемых ими заболеваний.

* * *

Возрастание угрозы применения биологического оружия террористами и масштабы возможного воздействия биологических агентов на гражданское население заставили правительства разных стран и международные организации готовить планы ответных мер, находить способы

пресечения биотеррора. В середине 2001 г. обнародованы черновые материалы - рекомендации ВОЗ "Ответные меры системы общественного здравоохранения на угрозу применения биологического и химического оружия" [12]. В составлении этого документа принимали участие ведущие ученые разных стран.

В документе основное внимание уделено национальным планам противодействия терроризму. Национальное здравоохранение должно быть готово обнаружить и ликвидировать последствия вспышки любого биологического агента, включая традиционные и экзотические виды микроорганизмов. Существующие системы государственного эпидемиологического надзора и борьбы с инфекционными болезнями должны быть способны выявлять, локализовать и ликвидировать вспышку инфекционного заболевания независимо от того, следствие ли она естественного проявления природного патогена или результат его преднамеренного использования. Несомненно, что национальные планы противодействия биотерроризму должны входить составной частью в планы по борьбе со вспышками инфекционных заболеваний, химическими и радиологическими инцидентами.

В рекомендациях ВОЗ отмечается, что вводимые в практику методы обнаружения биологических агентов, базирующиеся на молекулярных технологиях, нуждаются в повышении чувствительности, быстроты и точности. Для обеспечения должного уровня профилактических мероприятий нужны новые безвредные и эффективные вакцины, созданные современными методами биотехнологии.

Необходимость дальнейшего развития медико-биологических исследований подчеркивается и в стратегическом плане, разработанном Национальным институтом аллергии и инфекционных заболеваний США уже после событий сентября 2001 г. В нем отмечается, что возможности выявления и предотвращения инфекций как последствий биотеррористических актов в немалой степени зависят от уровня фундаментальных и прикладных медико-биологических исследований.

США готовились к противодействию биотерроризму с середины 90-х годов прошлого века. В июне 1995 г. была издана секретная директива президента США, предусматривающая повышение готовности страны на случай совершения терактов, в том числе биологических. В мае 1998 г. началась разработка всеобъемлющей стратегии борьбы с биотерроризмом. В 2000 г. Центр по контролю за инфекционными заболеваниями США публикует Национальный стратегический план по готовности к действиям в случаях биологического и химического терроризма [18]. План предусматривает координированное участие в выявлении и ликвидации инцидентов более десяти различных организаций. Основные разделы плана: профилактика; надзор; диагностика биологических и химических агентов; принятие мер по ликвидации инцидента; система оповещения и информационного обеспечения. Предполагается обучение персонала, эффективный санитарно-эпидемиологический надзор и обеспечение готовности всех участников к обнаружению и ликвидации последствий возможного применения химических и биологических агентов. Ключевым моментом плана является создание в США многоуровневой сети диагностических лабораторий для быстрого обнаружения, идентификации и оповещения служб здравоохранения территорий, штатов, районов и городов о выявленных агентах биологической и химической природы. План ориентирован на модернизацию существующих структур по борьбе с инфекционными болезнями, прежде всего на местном уровне.

В планах ВОЗ и Центра по контролю за инфекционными заболеваниями США предлагаются меры, направленные на совершенствование клинической базы и подготовку медицинского персонала. Медики должны хорошо представлять текущую эпидемическую ситуацию, знать потенциальные биологические агенты и симптоматику инфекционных заболеваний, нередко отличающуюся от естественно возникающих заболеваний. Они должны овладеть средствами лечения и способами предотвращения эпидемий. Особое внимание в этих планах уделено созданию системы мониторинга за необычными случаями заболеваний.

В 1999 г. на борьбу с биотерроризмом различным ведомствам США были выделены значительные средства. Началась реализация программ по созданию запасов 18 новых вакцин, включая новые вакцины против оспы, запасов медикаментов и антибиотиков, предназначенных в первую очередь для полиции, пожарных и медицинских работников. Проведен ряд учений, моделирующих использование террористами в крупных городах особо опасных инфекционных агентов - чумы, сибирской язвы, оспы [19-21].

К сентябрю 2001 г. США отнюдь не считали себя неподготовленными к террористическим актам с применением биологического и другого оружия массового уничтожения. Вместе с тем оказалось, что система здравоохранения США не располагает реальными возможностями, необходимыми для быстрой обработки большого числа жертв, не имеет достаточных площадей изоляторов, где должны размещаться инфекционные больные. Кроме того, врачи не сразу сумели поставить правильный диагноз сибирской язвы. Так, случай заражения грудного младенца в Нью-Йорке был подтвержден только через полторы недели после появления первых симптомов [1]. Обнаружилось, что наборы медицинских средств борьбы с инфекцией - диагностические тест-системы, вакцины и терапевтические лекарства – устарели, а их запасы недостаточны.

Сентябрьские события 2001 г. вызвали страх и панику среди населения, напуганного не только самим фактом биотерроризма, но и неготовностью здравоохранения, демонстрировавшего признаки перенапряжения даже при малочисленных случаях заражения сибирской язвой. Очевидно, что выбор биологического агента и способа его распространения в большей степени имел целью оказать психическое воздействие на общество, чем вызвать крупномасштабную эпидемию. И цель была достигнута. Недостаток правдивой, объективной и профессионально поданной информации об используемой террористами бактериальной рецептуре, ее поражающем действии и способах профилактики усугубил панику.

Многие страны, осознав реальную возможность применения биологических агентов террористами, предприняли определенные шаги и в области совершенствования законодательной базы. В частности, были внесены поправки в уже существующие законы, ужесточающие наказание за терроризм. В США в январе 2002 г. подписан Закон о терроризме. В июне 2002 г. принят Закон о защите здоровья населения и реагировании на биотерроризм, направленный на улучшение работы портовых инспекций, защиту продовольственных поставок, контроль биологических материалов и расширение возможностей реагирования системы здравоохранения на серьезное нападение [22, 23]. После подписания этих законов на борьбу с биотерроризмом выделили дополнительно 2.9 млрд. долл. В федеральном бюджете на 2003 финансовый год на эти цели предлагается выделить уже 5.9 млрд. долл. - в три раза больше, чем в 2002 финансовом году. Почти половина этих средств (2.4 млрд. долл.) будет направлена на развитие фундаментальных и прикладных исследований, призванных обеспечить США медицинскими средствами, которые требуются для эффективного ответа на вызов террористов [24].

В России начиная с 1997 г. предпринимаются меры противодействия биотерроризму. Создана Межведомственная антитеррористическая комиссия РФ, для решения оперативных вопросов образована секция по биотерроризму, включающая в себя специалистов многих министерств и ведомств. В 1999 г. по инициативе Минздрава России на уровне Межведомственной антитеррористической комиссии РФ была представлена концепция деятельности государственных органов власти при возникновении чрезвычайных ситуаций, вызванных терактами с применением биологического и химического оружия. В том же году утверждена Федеральная целевая программа "Создание методов и средств защиты населения и среды обитания от опасных и особо опасных патогенов в чрезвычайных ситуациях природного и техногенного характера на 1999-2005 гг." (нынешнее ее название - "Защита от патогенов"). В ней определены следующие приоритеты: фундаментальные исследования патогенов, прогнозирование вспышек инфекционных заболеваний, специфическая индикация и диагностика, профилактика и лечение, защита от патогенов (средства и методы обеззараживания). Создан Центр специальной

лабораторной диагностики и лечения опасных и экзотических инфекций, организован Федеральный межведомственный центр подготовки специалистов, испытания средств и методов индикации возбудителей особо опасных инфекций [19,25].

После событий осени 2001 г. в нашей стране подготовлен проект поправок к Закону "О борьбе с терроризмом", ряд министерств ведет работу над Концепцией биологической безопасности России [26]. Российская академия медицинских наук и Минздрав России разрабатывают программу, предусматривающую план действий по оказанию населению медицинской и психологической помощи в связи с возможными угрозами биотерроризма. В план включена специальная подготовка медицинского персонала и обучение населения методам защиты от угрозы биотерроризма [27].

Большую актуальность приобретает созданная еще в 2000 г. национальная Программа фундаментальных и прикладных исследований вируса оспы. Нынешнее поколение врачей не имеет опыта в диагностике и лечении этой инфекции, отсутствуют современные диагностикумы, лечебные препараты, ограничен запас вакцин [28]. Минздрав России подготовил Концепцию возобновления вакцинации против оспы, которая в 2002 г. внесена на рассмотрение правительства.

В России значительная часть научно-организационных мер противодействия биотерроризму проводится в рамках существующей системы борьбы с инфекционными заболеваниями. Основные задачи этой системы:

• повышение эффективности эпидемического надзора за инфекционными заболеваниями на основе повсеместного использования компьютерных информационно-аналитических систем, мониторинга состояния окружающей среды и коллективного иммунитета населения;

• развитие нормативной и методической базы в области профилактики инфекционных заболеваний;

• реализация федеральных и региональных программ по обеспечению санитарно-эпидемиологического благополучия населения;

• совершенствование системы вакцинопрофилактики инфекционных заболеваний;

• расширение информационно-пропагандистской системы по соблюдению населением мер личной и общественной профилактики инфекционных болезней;

• укрепление материально-технической базы лабораторий лечебно-профилактических учреждений и центров Госсанэпиднадзора, оснащение их необходимым оборудованием, внедрение современных методов индикации возбудителей инфекционных заболеваний (ПЦР и др.);

• активизация научных исследований в области диагностики, эпидемиологии, лечения и профилактики инфекционных заболеваний [25].

Готовность к возможным актам биотерроризма удается повысить, если в крупных региональных центрах, особенно там, где есть международные аэропорты, будут постоянно функционировать инфекционные больницы, оборудованные с учетом должного уровня биозащиты (не ниже Р-3). На том же уровне биобезопасности следует оборудовать региональные клинико-микробиологи-ческие и иммунологические лаборатории, которые должны сотрудничать с инфекционными больницами и соответствующими НИИ.

Комплекс мер противодействия угрозе биотерроризма, дополняя уже существующую систему борьбы с инфекционными заболеваниями, призван усовершенствовать структуру здравоохранения, повысить уровень биомедицинских исследований, а также улучшить взаимодействие с другими министерствами и ведомствами, учреждениями Госсанэпиднадзора и НИИ соответствующего профиля. * * *

После событий осени 2001 г. еще очевиднее стала необходимость усиления международного сотрудничества в деле борьбы с угрозой биотерроризма. Консолидация усилий государств в этой борьбе ведется на различных уровнях.

В ноябре 2001 г. президенты России и США приняли совместное заявление, в котором отмечается, что обе страны будут вести совместную работу по противодействию угрозе биотерроризма. Стороны заявили о приверженности Конвенции 1972 г. о запрещении разработки, производства и накопления бактериологического, биологического, токсинного оружия и его уничтожении [29].

В ноябре 2001 г. США и шесть других стран присоединились к Оттавскому плану, предусматривающему усиление международного сотрудничества в предупреждении биологических терактов. Страны договорились налаживать совместное сотрудничество в обеспечении вакцинами и антибиотиками; участвовать в конструктивном диалоге по унификации нормативно-правовой базы создания вакцин, в частности, вакцин против оспы; оказывать дальнейшую поддержку существующей сети ВОЗ по наблюдению за заболеваниями и ее усилиям по выработке согласованной стратегии сдерживания вспышек заболеваний. Предполагается обмениваться планами подготовки к чрезвычайным ситуациям и ликвидации их последствий; рассматривать возможности совместной подготовки кадров; организовать обмен данными наблюдений национальных медицинских лабораторий и информацией о реальном или грозящем заражении продовольствия, стратегиями безопасного продовольственного снабжения [30].

Тема объединения усилий по противодействию терроризму обсуждалась на состоявшемся в мае 2002 г. в Москве рабочем совещании, на котором присутствовали представители американских и российских министерств иностранных дел, обороны, здравоохранения, науки [31]. Вопрос о принятии общественным здравоохранением ответных мер при умышленном использовании биологического, химического или радиологического оружия был рассмотрен в мае 2002 г. на 55-й Всемирной ассамблее здравоохранения. Секретариат ассамблеи отметил важность борьбы с возникающими в природных условиях эпидемиями, например, с лихорадкой Эбола. Особое внимание было уделено мерам защиты воды и продуктов питания от заражения химическими и биологическими агентами [33].

В мире имеются ресурсы для борьбы с инфекционными болезнями, и эти ресурсы могут быть использованы для противодействия биотерроризму. В 1997 г. на базе национальных центров и лабораторий, сотрудничающих с ВОЗ, была создана международная сеть по сбору данных и контролю за вспышками наиболее опасных заболеваний. Действуют сотни центров ВОЗ, специализирующихся по отдельным инфекциям, сеть лабораторий Панамериканской организации здравоохранения, Международная сеть клинической эпидемиологии, сеть институтов Пастера, сеть исследовательских центров Национального института здравоохранения США, в которую вовлечены и университеты [9].

В наши дни большое внимание уделяется созданию автоматизированных систем эпидемического обнаружения и реагирования. В США уже внедрены несколько систем для улучшения надзора как за инфекционными заболеваниями, так и за выявлением случаев биотерроризма в крупных городах. Так называемая Система усовершенствованного эпидемиологического обнаружения и экстренного реагирования функционирует в 79 госпиталях [33]. Разработана автоматизированная система для учета информации, полученной при амбулаторном посещении больных и во время телефонных разговоров [34].

Существенную помощь в анализе различных эпидемических ситуаций могут оказать современные геоинформационные системы, или ГИС-технологии. Первые исследования в области эпидемиологии, проведенные в России с применением ГИС-технологий, показали, что с их помощью можно изучать закономерности распространения инфекционных заболеваний, прогнозировать их развитие, анализировать последствия актов биотерроризма [35].

По традиции для ликвидации очагов заболевания используются созданные под эгидой ВОЗ специализированные команды (эпидотряды). Они ликвидировали эпидемические вспышки геморрагической лихорадки Марбург в Конго в 1999 г., энцефалит, вызванный вирусом *Nipah,* в Малайзии в 1999 г., лихорадку Рифт-Вэлли в Саудовской Аравии в 2000 г., желтую лихорадку в Либерии в 2001 г. [36].

Чтобы повысить эффективность борьбы с инфекционными заболеваниями, Д. Хендерсон - главный советник по науке министра здравоохранения и социального обеспечения США, предлагает организовать сеть из 15 региональных центров. Они должны располагать: клиническими амбулаторными службами по инфекционным болезням; исследовательскими диагностическими лабораториями; эпидотрядами на правах службы эпидемиологической разведки, обеспечивающими контроль за регионом, в котором проживают 2-5 млн. человек; образовательно-тренировочной базой для подготовки национального и международного персонала. Эта сеть должна взаимодействовать с такими организациями, как Центр по контролю за инфекционными заболеваниями США, Национальный институт аллергических и инфекционных заболеваний США и с другими центрами. Для обеспечения легитимности и стабильной работы региональных центров необходима их тесная связь с ВОЗ и государственными структурами стран, в которых они находятся [9].

В настоящее время идет работа над организацией единого Европейского центра по инфекционным заболеваниям, который начнет функционировать в 2005 г. Подобно Национальному центру инфекционных болезней США, европейский центр будет координировать научно-исследовательские работы, осуществлять надзор за инфекционными заболеваниями, проводить профессиональное обучение. Предполагается, что новый центр поможет оптимизировать деятельность уже существующих в Европе национальных структур, таких как Институт Пастера (Франция), Каролинский институт (Швеция), Институт им. Роберта Коха (Германия), и повысить готовность Европы противодействовать угрозе биотерроризма [37].

В России уже функционирует уникальная система, предназначенная для борьбы и надзора за инфекционными заболеваниями, которой нет нигде в мире, - Государственная санитарно-эпидемиологическая служба: 89 региональных и 1700 центров районного уровня. Есть система противочумных институтов, включающая 5 НИИ, 11 станций и 14 отрядов, работающих на территории природных очагов [38].

Учитывая зарубежный опыт, представляет интерес идея создания и в России региональных центров по борьбе с инфекционными заболеваниями на базе существующих научно-исследовательских центров и институтов данного профиля. Под руководством Минздрава России эти региональные центры могли бы выполнять программы, ориентированные на выявление и ликвидацию природных или террористических вспышек инфекционных заболеваний в своем регионе. Территориальное разграничение зон действий таких центров должно в первую очередь предусматривать экономическую и геополитическую значимость региона для национальной безопасности России. В дальнейшем российские региональные центры могли бы войти в международную систему биологической безопасности [9].

Успешное противодействие биологическому и химическому терроризму невозможно без объединения усилий различных ведомств, например, Минобороны и Минздрава России, РАМН, РАН, РАСХН. Накопленный этими ведомствами опыт может послужить основой для создания национальной системы противодействия террористическим актам. Заслуживает внимания Система мониторинга особо опасных малоизученных, экзотических, в том числе зооантропонозных заразных болезней животных, разработанная в Минсельхозе России [39].

Несомненным условием обеспечения биологической безопасности России является достаточное и стабильное государственное финансирование фундаментальных и прикладных биомедицинских исследований, направленных на разработку диагностических и лечебно-профилактических средств нового поколения [40]. На VIII съезде эпидемиологов, микробиологов и паразитологов, проходившем в Москве в марте 2002 г., была подчеркнута необходимость кардинального расширения научно-исследовательских и опытно-конструкторских работ в следующих направлениях:

• новые ускоренные методы и средства индикации возбудителей инфекционных заболеваний, создаваемые на основе перспективных разработок в области биотехнологии и нанотехнологий;

• вакцины нового поколения, живые рекомби-нантные вакцины на базе вирусных векторов, разрабатываемые с использованием методов генной инженерии, живых поливалентных противовирусных вакцин, ДНК-вакцин;

• новые химические субстанции и рецептура новых дезинфицирующих препаратов [25].

Следует также продолжить поиск, испытания и организацию производства более эффективных препаратов для лечения инфекционных заболеваний. Дальнейшее изучение молекулярного разнообразия и молекулярной изменчивости инфекционных агентов позволит не только проводить быструю идентификацию вызвавших вспышку разновидностей инфекционных агентов, но и прогнозировать возникновение новых патогенов на основе естественной их эволюции или путем скрытых работ биотеррористов по направленному искусственному изменению их свойств.

В заключение считаем необходимым еще раз подчеркнуть, что способность государства противодействовать угрозе биотерроризма - одному из факторов риска появления и распространения инфекционных заболеваний - определяется состоянием и подготовленностью системы здравоохранения к обнаружению, локализации и ликвидации вспышек инфекций независимо от происхождения вызвавших их патогенов; уровнем проводимых фундаментальных и прикладных исследований, направленных как на молекулярно-эпидемиологическое изучение патогенов, так и на создание средств диагностики, профилактики и лечения, требуемых для предотвращения вспышек заболеваний или их ликвидации. И безусловно, успешной борьбе с биотерроризмом будет способствовать вхождение России в зарождающуюся международную систему биологической безопасности.

Выражаем признательность Т.Ю. Иванькиной и М.И. Кисуриной за помощь в подготовке материала и оформлении настоящей статьи.

Fred Charatan

Marcia Angell: **The Truth About the Drug Companies: How they deceive us and what to do about it. Review**

BMJ, 9 October 2004, Vol. 329: 262
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC521592/

Dr. Marcia Angell, a member of Harvard Medical School's Department of Social Medicine, has written a painstakingly researched book on the wiles and ways of what has come to be called "big pharma." It is a clear exposé of the American drug industry and is written in the impassioned but impeccable prose we expect from a former editor of the New England Journal of Medicine.

Angell says that $200bn (£110bn; €165bn) is spent annually on prescription drugs in the United States. With the cost rising 12% a year, it is the fastest growing part of America's swollen health bill. In 2002 the average price of the 50 commonest drugs used by elderly people was nearly $1500 for a year's supply. At, say, six prescriptions – not an uncommon number among elderly Americans – that's $9000 a year for one person's drugs. What are the remedies for this unaffordable financial burden? Choose between food, fuel, or drugs? Take half doses? Take a trip to Canada to buy cheaper drugs? Or ignore your doctor's prescriptions altogether?

To deal with this dilemma the US Congress passed the Medicare Reform Bill at the end of 2003, with a drug benefit to begin in 2006 – but this is already inadequate, as it's been overtaken by sharply rising costs.

Angell says that public resentment and resistance to these consumer rip offs has been growing. Big pharma's response has led not to drug discounts but to public relations ploys justifying bloated prices, mainly involving the three marketing mantras: research, innovation, and free enterprise in the interests of shareholders. She points out that the United States is the world's major profit centre for drugs. Big pharma relocates here from other countries "to feed on the unparalleled research output of American universities and the [taxpayer funded] National Institutes of Health."

For two decades the drug industry was the most profitable sector; even in 2003 it came third, behind crude oil and banking. But now, Angell says, it is facing "a tidal wave of government investigations and civil and criminal lawsuits."

She writes, "The litany of charges includes illegally overcharging Medicaid and Medicare, paying kickbacks to doctors, engaging in anticompetitive practices, colluding with generic companies to keep generic drugs off the market, illegally promoting drugs for unapproved uses, engaging in misleading direct-to-consumer advertising, and, of course, covering up evidence. Some of the settlements have been huge."

The book's 13 chapters examine the drug industry's exaggerated claims of producing new drugs and its barrage of media marketing disguised as consumer education. Actually, big pharma's main business is in producing what are called "me too" drugs: merely variations of old drugs created to prolong patent rights and to grab market share.

Angell remembers the philosopher Immanuel Kant: "Physicians think they do a lot for a patient when they give his disease a name." And she writes, "As the whole world knows, there is now a condition recently christened ‘erectile dysfunction,’ and a drug, Viagra [sildenafil], and two me-toos, Levitra and Cialis, to treat it. Advertisements for these drugs feature not decrepit old men but young athletes. The implication is obvious. Any episode of impotence, no matter how rare and how mild, is ‘erectile dysfunction,’ there is a pill for it, and if this macho quarterback is not too embarrassed to ask for it, you don’t have to be either."

Less profitable drugs – those against malaria and tuberculosis, for example – receive much less attention. The Bush administration, friendly to big pharma, "has refused to allow any of the promised $15bn in federal funds allotted for HIV/AIDS treatment in the Third World to be spent on generic drugs."

Among the many wiles exposed are big pharma’s use of contract research organisations to exert undue influence over clinical research and its insidious seduction of doctors. In 2001 drug companies gave doctors nearly $11bn worth of "free samples." This was in addition to the "food, flattery, and friendship" provided by drug company representatives to doctors (BMJ 2003;326:1189).

The final chapter, "How to Save the Pharmaceutical Industry – And Get Our Money’s Worth," gives seven essential reforms, chief of which is for the Food and Drug Administration to compare new drugs not with placebos but with old drugs, to see whether there are any additional benefits.

Angell’s goal is access to good drugs at reasonable prices, which requires public pressure to spur the government to action against big pharma’s powerful and ubiquitous lobbyists (more numerous than the members of Congress) and its political campaign contributions. She has performed an important public service in focusing on the drug companies and their disingenuousness. The reform of big pharma starts with a public outcry against the abuses she has shown. And here doctors should stand by their patients, not their purses.

Dr. Sherri Tenpenny

Polio "Non-Outbreak" Among the Amish

The National Vaccine Information Center, 2 December 2005
https://www.vaccineinfo.net/news/Polionoutbreak_Amish.shtml

On October 14, the major media outlets shrieked a report of "*the first outbreak of polio in the United States in 26 years*," occurring in an Amish community in central Minnesota. =>
[David Brown. Polio Outbreak Occurs Among Amish Families In Minnesota. – Wasington Post, 14 October 2005]
https://www.washingtonpost.com/archive/politics/2005/10/14/polio-outbreak-occurs-among-amish-families-in-minnesota/0fe0558f-dc8d-4052-8c1e-dce03759d9c1/

The specter of hundreds of children in braces and iron lung machines lining the halls of hospitals immediately danced through the air, and directly into the minds of parents who have chosen to not vaccinate their children.

More than a month later, phone calls and emails from concerned parents continue to pour in. The fears surrounding this "outbreak" need to be put to rest.

First of all, there wasn't an "outbreak of polio." There was only the discovery of an inactivated polio virus in the stool of four children. The first confirmation was in a 7-month old Amish infant, presumably hospitalized, with severe immune deficiency. The "find" prompted screening of other children in the community; four children were confirmed positive. None experienced any type of paralysis.

Part of the panic can be blamed on inaccurate reporting. The virus that was identified was not "wild polio." It was a virus that is found only in the oral polio vaccine (OPV). Oral vaccine-strain viruses are inactivated with formaldehyde and are generally considered by the CDC "too weak" to cause disease. Even though the OPV is still used extensively in Third World countries, it has not been used in the United States since 2000. How did children in an isolated Amish community, with no exposure to foreigners, become exposed to vaccine-strain polio virus? That remains a mystery.

The unasked question is why was finding this strain front-page news? My suspicion is that it was because it was an Amish child; a large number of the Amish choose to not vaccinate their children. A confirmation would serve a dual purpose: to make an "example" of the Amish and scare parents into believing polio still being "in circulation," when in fact, it is not.

A review of polio is important to alleviating the fears about the disease. Keep in mind that the last case of "wild type" polio virus in U.S was in 1979; the last case the Western Hemisphere was in the Peru, in 1991.

Polioviruses are transient inhabitants of the gastrointestinal tract. Up to 95% of all polio infections are completely asymptomatic. Approximately 5% of polio infections consist of a minor, nonspecific illness consisting of an upper respiratory tract infection (sore throat and fever) and gastrointestinal disturbances (nausea, vomiting, abdominal pain, and diarrhea). This influenza-like illness, clinically indistinguishable from the myriad of other viral illnesses, is characterized by complete recovery in less than a week with resultant life time immunity.

Less than 1% of all polio infections result in paralysis. Most importantly, the vast majority of individuals who contract paralytic poliomyelitis recover with complete-or near complete-return of muscle function. Any weakness that is still present 12 months after onset of paralysis is usually considered permanent.[1]

The take home message from the "Amish outbreak" is this:

1. Polio is not a synonym for paralysis.
2. The presence of vaccine-strain polio identified in the stool of 4 asymptomatic children is not a "polio outbreak."
3. There have been no wild polio viruses identified in the Western hemisphere since 1991.
4. The WHO certified the Western hemisphere "polio free" in 1994.

For parents who choose not to vaccinate, assessing the risk of contracting polio, based on the facts of this so-called outbreak and the truth about the disease, needs to be put in perspective. Here are some things to think about:

In 1997 alone, 112 children died from falls.

In 1999, in Georgia alone, 53 children died in drowning accidents; 4 drowned at home in a bathtub.[2]

Would you stop bathing your children or prohibit swimming and playing due to these small risks?

What is the real risk of contracting polio? Certainly, it is zero from this Amish "outbreak." The entire vaccine industry is based on fear. Learning the facts about polio will dissipate personal fears and so will putting the risks in perspective.

Leavitt to Grant Waivers for Bird Flu Vaccine Makers

Fox News, Associated Press, 13 February 2006
https://www.foxnews.com/story/leavitt-to-grant-waivers-for-bird-flu-vaccine-makers

Washington – The government won't wait for bird flu to hit U.S. shores before granting liability protections to vaccine manufacturers and others that make products needed to battle a pandemic.

Health and Human Services Secretary Mike Leavitt said Monday that the administration soon would enter into contracts for bird flu vaccine, rapid tests to detect the virus, and technology that would make available vaccine go farther.

"At some point in that process, we'll need to deal with the issue of liability," he told reporters.

In December, Congress gave Leavitt the authority to grant liability waivers if a public health emergency exists.

Under the waivers, people injured by a vaccine against bird flu would have to prove willful misconduct to bring a claim for damages. Critics have said that such a high threshold would make it almost impossible for people injured by a drug to file a lawsuit.

Leavitt said it's possible that vaccine manufacturers would want the extra protections before conducting clinical trials.

"If you're a vaccine manufacturer, you're likely not going to want to move to that step unless you've got adequate liability protection." he said.

Bird flu has killed at least 88 people in Asia and Turkey since 2003, according to the World Health Organization. An additional two deaths from bird flu have been confirmed in Indonesia. Birds carrying the virus have also been detected in Italy, Greece and Nigeria.

Leavitt said there's no reason to think that H5N1 virus will stop its migration.

"At some point in time, there will be a wild bird that will be discovered (with the virus) in the United States," he said. "That in itself won't be an emergency. That is something we should expect."

Influenza Vaccination During Pregnancy:
A Critical Assessment of the Recommendations of the Advisory Committee on Immunization Practices (ACIP)

JAAPS, Summer 2006, 11(2): 41-47
https://www.jpands.org/jpands1102.htm // https://www.jpands.org/vol11no2/ayoub.pdf

Abstract

Influenza vaccination during all trimesters of pregnancy is now universally recommended in the United States. We critically reviewed the influenza vaccination policy of the CDC's Advisory Committee on Immunization Practice (ACIP) and the citations that were used to support their recommendations.

The ACIP's citations and the current literature indicate that influenza infection is rarely a threat to a normal pregnancy. There is no convincing evidence of the effectiveness of influenza vaccination during this critical period. No studies have adequately assessed the risk of influenza vaccination during pregnancy, and animal safety testing is lacking. Thimerosal, a mercury-based preservative present in most inactivated formulations of the vaccine, has been implicated in human neurodevelopment disorders, including autism, and a broad range of animal and experimental reproductive toxicities including teratogenicity, mutagenicity, and fetal death. Thimerosal is classified as a human teratogen.

The ACIP policy recommendation of routinely administering influenza vaccine during pregnancy is ill-advised and unsupported by current scientific literature, and it should be withdrawn. Use of thimerosal during pregnancy should be contraindicated.

...

- InfluenzaVaccine
- Influenza in Pregnancy
- Is Influenza Vaccination During Pregnancy Effective?

- The CDC's Influenza Statistics ... => The CDC and news media frequently proclaim that there are about 36,000 influenza-associated deaths annually. Review of the mortality data from the CDC's National Vital Statistics System (NVSS) reveals these estimates are grossly exaggerated.

- Is InfluenzaVaccination Safe During Pregnancy?
- Thimerosal, a Preservative with Risks
- Neurotoxicity ofMercury
- Fetal and Reproductive Toxicity of Mercury

Conclusions

The ACIP's recommendation of influenza vaccination during pregnancy is not supported by citations in its own policy paper or in current medical literature. Considering the potential risks of maternal and fetal mercury exposure, the administration of thimerosal during pregnancy is both unjustified and unwise. Pregnancy should continue to be a time when doctors are highly protective of their patients with regard to any fetal exposure. Without adequate safety testing, a risk-benefit analysis of influenza vaccination during pregnancy is not possible, and therefore the ACIP's present recommendation should be withdrawn.

The Progressive

Matthew Rothschild

Exclusive!

The FBI Deputizes Business

The Progressive, 7 February 2008
https://web.archive.org/web/20080214145659/http:/www.progressive.org/mag_rothschild0308

Today, more than 23,000 representatives of private industry are working quietly with the FBI and the Department of Homeland Security. The members of this rapidly growing group, called InfraGard, receive secret warnings of terrorist threats before the public does – and, at least on one occasion, before elected officials. In return, they provide information to the government, which alarms the ACLU. But there may be more to it than that. One business executive, who showed me his InfraGard card, told me they have permission to "shoot to kill" in the event of martial law.

InfraGard is "a child of the FBI," says Michael Hershman, the chairman of the advisory board of the InfraGard National Members Alliance and CEO of the Fairfax Group, an international consulting firm.

InfraGard started in Cleveland back in 1996, when the private sector there cooperated with the FBI to investigate cyber threats.

"Then the FBI cloned it," says Phyllis Schneck, chairman of the board of directors of the InfraGard National Members Alliance, and the prime mover behind the growth of InfraGard over the last several years.

InfraGard itself is still an FBI operation, with FBI agents in each state overseeing the local InfraGard chapters. (There are now eighty-six of them.) The alliance is a nonprofit organization of private sector InfraGard members.

"We are the owners, operators, and experts of our critical infrastructure, from the CEO of a large company in agriculture or high finance to the guy who turns the valve at the water utility," says Schneck, who by day is the vice president of research integration at Secure Computing.

"At its most basic level, InfraGard is a partnership between the Federal Bureau of Investigation and the private sector," the InfraGard website states. "InfraGard chapters are geographically linked with FBI Field Office territories."

In November 2001, InfraGard had around 1,700 members. As of late January, InfraGard had 23,682 members, according to its website, www.infragard.net, which adds that "350 of our nation's Fortune 500 have a representative in InfraGard."

To join, each person must be sponsored by "an existing InfraGard member, chapter, or partner organization." The FBI then vets the applicant. On the application form, prospective members are asked which aspect of the critical infrastructure their organization deals with. These include: agriculture, banking and finance, the chemical industry, defense, energy, food, information and telecommunications, law enforcement, public health, and transportation.

Examining the FDA's HPV Vaccine Records

A Judicial Watch Special Report, 30 June 2008
http://www.whale.to/vaccine/JWReportFDAhpvVaccineRecords.pdf

Detailing the Approval Process, Side-Effects, Safety Concerns and Marketing Practices of a Large-Scale Public Health Experiment

Introduction

This Judicial Watch Special Report is an analysis of records obtained from the Food and Drug Administration (FDA) concerning a recent vaccine called Gardasil. Gardasil helps protect against four types of human papillomavirus (HPV). The vaccine was approved in May 2006 and was created and marketed by Merck & Company Incorporated.

The records include Merck's patent and drug information submitted to the FDA, transcripts and briefing material from approval meetings, and reports documenting health, safety, and efficacy test results, as well as Vaccine Adverse Event Reporting System (VAERS) documents detailing 8,864 cases of adverse effects experienced by people after receiving the Gardasil vaccine. VAERS reports show that at least eighteen people have died after receiving Gardasil.[1] Many health officials believe that adverse reactions to medications are widely underreported, therefore the actual number of adverse events occurring after vaccination with Gardasil is likely to be higher.

Judicial Watch obtained these records under the provisions of the Freedom of Information Act (FOIA), 5 U.S.C. § 552. The request, asking for documents concerning Gardasil, was originally submitted to the FDA on May 9, 2007. The FDA produced documents on May 15, 2007; September 13, 2007; February 27, 2008, and June 10, 2008.

Judicial Watch uncovered thousands of pages of material pertaining to Gardasil, which is designed to prevent cervical cancer. The controversial vaccine was fast-tracked for approval by the FDA despite concerns about Gardasil's safety and long-term effects. The vaccine is still in the testing stages (final report due September 30, 2009), but it is already being administered to thousands of young girls and women.[2] Mandatory vaccination has been opposed by the American College of Pediatrics and The New England Journal of Medicine. Legislators in 41 states and Washington, DC have introduced legislation to require, fund or educate the public about the HPV vaccine and 17 states have enacted legislation. Michigan, Texas and Virginia took steps toward mandatory vaccination for sixth grade girls; however, all three states have postponed that required mandate.[3]

Judicial Watch is concerned by the facts detailed in the FDA's adverse event reporting associated with Gardasil. Merck has waged an aggressive lobbying campaign with state governments to mandate this HPV vaccine for young girls. Given all the questions about Gardasil, the best public health policy would be to reevaluate its safety and to prohibit its distribution to minors. In the least, governments should rethink any efforts to mandate or promote this vaccine for children.

Executive Summary

In May 2007, Judicial Watch submitted a request to the FDA under the Freedom of Information Act for all records concerning Merck's new anti-HPV vaccine, Gardasil.

After Judicial Watch filed a lawsuit in October 2007 to compel record production, the FDA finally released four sets of documents, the last in June 2008. These records detail the development and expedited approval of Gardasil. The documents include patent and licensing memoranda, test reports for the vaccine, and the final briefing document on Gardasil submitted to the FDA in April 2006, one month before the vaccine was approved. The FDA also produced 8,864 VAERS reports. Judicial Watch uncovered a transcript of Merck's May 18, 2006, meeting with the Vaccines and Related Biological Products Advisory Committee (VRBPAC), at which the vaccine received a unanimous vote of approval.

Analysis of the records shows:

• Gardasil is a prophylactic, preventative vaccine and will not treat pre-existing HPV infection. It is not a cancer vaccine or cure.

• Gardasil is marketed as a vaccine that prevents cancer, but it " . . . has not been evaluated for the potential to cause carcinogenicity or genotoxicity."

• Gardasil is not 100% effective against all HPVs. It is designed to protect against only four strains of HPV, even though there are over thirty strains including at least fifteen that can cause cancer.

• While Gardasil is the most expensive vaccine ever to be recommended by the FDA, its long-term effectiveness is unknown and could be as brief as only two to three years.

• During testing, an aluminum-containing placebo was used. Aluminum can cause permanent cell damage and is a reactive placebo, unlike most standard saline placebos. This means that tests of Gardasil may not have given an accurate picture of safety levels.

• Although some states are considering making it mandatory for young girls to get the Gardasil vaccine, it has only been tested with one other vaccine commonly given to children. There are ten commonly administered adolescent vaccines.

• Gardasil is still in the testing stages, and will not be fully evaluated for safety until September 2009. VAERS reports show that as many as eighteen people have died after receiving Gardasil.

...

Conclusions

Gardasil is such a new drug that it is impossible to say at this point how beneficial it may be. Most scientists, including Dr. Diane Harper, agree that booster shots will be needed, and guess that the original vaccine will be effective for at least five years. It is important to emphasize that regardless of how effective Gardasil is, it does not protect against all HPV strains and it will never eliminate the need for regular testing and Pap screening.

Gardasil's safety for the general public is a serious concern. While no drug is ever completely risk-free, a careful analysis must be made as to whether the benefits are worth the costs. HPV, though potentially devastating, is quite often completely harmless.

Most HPV infections, even ones caused by high-risk strains, go away on their own and never develop into cancer. Even when they do, in most cases it takes years for cancer to occur and it is easily preventable as long as the HPV infection is detected early.

Even without Gardasil, cervical cancer deaths have decreased drastically in the past several decades. The American Cancer Society estimates that deaths from cervical cancer declined 74% between 1955 and 1992, and that the rate continues to decrease by about 4% each year. Also, most cases occur in women in their forties.[57] With these statistics in mind, one might ask whether Gardasil vaccination is absolutely necessary, especially for children. At this point in time, we do not know if it will prevent cancer, or whether it will have unforeseen consequences. The American public must ask themselves if Gardasil is really worth the risk. Fast-tracking drugs and vaccines before their safety has been fully evaluated is unethical and dangerous, and until more tests have been completed on Gardasil no vaccination mandates should be established.

• Gardasil has not been tested thoroughly enough to know whether it will be safe or effective in the long term.

• Even if it shown that the Gardasil vaccine is effective, it is still unknown how long the vaccine lasts or if there will be a need for booster shots.

• Regardless of its potential to help prevent HPV and cancer, Gardasil should never be administered without a prescreening for HPV since it has the potential to make existing cases worsen.

• It is important that people remember that this vaccine will not eliminate the need for regular Pap screening. No vaccine is 100% effective, and Gardasil is designed to protect against only four strands of HPV.

• While Gardasil may be an important medical advance, it is unwise to compromise the health and safety of the American public, especially children, by mandating or marketing it before sufficient tests are concluded.

The Worldwide Environmental Crisis Gone Missing: The Precautionary Principle

Global Research, 11 February 2009
https://web.archive.org/web/20100509204257/http://globalresearch.ca/index.php?context=va&aid=12268

"We believe there is compelling evidence that damage to humans and the worldwide environment, is of such magnitude and seriousness that new principles for conducting human activities are necessary." Wingspread Conference Center. January 1998.

It is a given that our environment is in grave trouble. Although the window is now small, we still have the luxury to discuss it, and even continue to change our wasteful behavior. Not so, for the great majority of poor people around our planet who have to deal day-to-day with bare survival. The causes are many but primarily include human-created environmental devastation, at least 60 illegal Clandestine Weather Modification programs (including dispersal of highly toxic aerosol Chemtrails that poison every breath we take), massive destruction of habitats, unsustainable uses of fuels, logging, mining, and overfishing, to name some of the major ones. These are all done with gargantuan technologies that leaves behind unmitigated devastation.

...

When they treat their patients, doctors take an oath first "**to do no harm**." As with humans, so it must also be with our fragile environment. This is the basis of the Precautionary Principle: first, do no harm.

Dr. Peter Montague, Executive Director of Environmental Research Foundation and Editor of "Rachel's Democracy and Health News," noted in a 2006 speech, there are three elements in taking a precautionary approach (2):

1. When we have reasonable suspicion of harm
2. When there is scientific uncertainty
3. We then have a duty to take action to prevent harm

Unfortunately, after publishing almost 1,000 issues of "Rachel's News" (since 1986), the outstanding Environmental Research Foundation [ERF] will close on Feb. 26. This is an enormous loss for so many of us who have often read "Rachel's" environmental news (first in print and later on-line) that was not reported elsewhere. ERF's website (www.rachel.org) has become a vital beacon for the latest news about the Precautionary Principle as well as for its outstanding reporting on a wide array of environmental issues with its high standard of excellence. There will be an archive; but the important up-to-date contributions will be greatly missed.

...

Many of our most formidable technological advances come at a very heavy price for our Collective Soul: genetically modified crops that poison the soil, contaminate the food that is grown in it, and grievously harm the farmers; extracting, at great human cost, the last of fossil fuels and precious metals, such as copper or gold --"peeling away the skin of the Earth!" as one Indonesian islander recently put it (4); and, over many decades, the marketing of unsafe pharmaceuticals without long-term testing, resulting in one serious medical crisis after another (while the companies took in windfall profits, their customers were often critically ill with drugs, then belatedly taken off the market). None of this massive harm speaks of any ethical concern. It bespeaks only of the corporate short-term bottom line: profit...

Special Report: Few Gaps in Analgesic Practice after Reuben Retractions

MedPage Today, 3 April 2009
http://www.medpagetoday.com/Surgery/Anesthesiology/13592

Little Falls, N.J., April 3 - With some of their specialty's most prominent, cutting-edge studies now exposed as fakes, anesthesiologists and pain management specialists are asking themselves: what do we know for sure?

The answer from academics, journal editors, and practicing physicians is: we still know a whole lot. But there are some hypotheses that will certainly need to be retested.

At the top of the list, the effects of NSAIDs and COX-2 inhibitors on bone fusion will have to be re-evaluated, along with the role of multimodal analgesic regimens in preventing chronic pain.

The impetus for this reworking is an internal audit by Baystate Medical Center in Springfield, Mass., into the work of Scott Reuben, M.D., until recently one the nation's most respected authorities on anesthesia and pain medicine.

In March, Dr. Reuben was accused of fabricating data in 21 studies over the last 15 years.

Now, some researchers say additional retractions may be in the cards. In fact, a PubMed search yielded more than 70 studies by Dr. Reuben, who is on indefinite leave from his position at Baystate and no longer holds a professorship at Tufts University in Medford, Mass.

Despite the need for some new, incontrovertible data, there isn't much in current clinical practice based solely on Dr. Reuben's work on multimodal anesthesia and other cutting-edge projects, researchers say.

"The big ramification isn't 'What pieces of information are we suddenly missing?' because I don't think there are huge gaps," said James P. Rathmell, M.D., of director of the Center for Pain Medicine at Massachusetts General Hospital. "Multimodal anesthesia works. It's not a panacea, but even [Dr. Reuben's] data didn't show it to be one."

What Works

The multimodal approach to analgesia involves using more than just opioids to control pain. NSAIDs and COX-2 inhibitors have been common, effective additions to analgesic regimens in the perioperative period of orthopedic and spinal surgeries. There were others besides Dr. Reuben who demonstrated the effectiveness of these combinations.

"We know that if you try multiple approaches to pain control rather than just one approach, you're more likely to have good pain control and reduce overall side effects," said Steven Shafer, M.D., of Columbia University and editor of Anesthesia & Analgesia, a journal that published some of Dr. Reuben's work. "That's not really in doubt."

James C. Eisenach, M.D., of Wake Forest University and editor of Anesthesiology, which also published some of the retracted studies, noted that Dr. Reuben also investigated whether antiepileptic and antidepressant agents could be used in multimodal approaches.

Dr. Reuben's positive findings were corroborated by other work, so Dr. Eisenach said he doubts that the practice of using these agents such as pregabalin (Lyrica) and gabapentin (Neurontin), "is going to change as a result of retracting those articles."

However, Dr. Eisenach said the role of COX-2 inhibitors, specifically in the postoperative period of orthopedic surgery, "remains controversial with Scott's studies taken out."

Invalidated Hypotheses

One major question that has arisen with the wake of the scandal is whether COX-2 inhibitors slow bone healing.

One of Dr. Reuben's studies found that COX-2 inhibitors "had no apparent effect on the rate of nonunion at the time of the one-year follow-up."

Many animal studies, however, have found the opposite effect, so Dr. Rathmell said most orthopedic surgeons were already skeptical about using COX-2 and other anti-inflammatories, particularly in spinal surgeries.

"Scott had a small amount of data and it wasn't very convincing," Dr. Rathmell said. "It wasn't prospective randomized studies. The first work was done retrospectively and the latter work prospectively but without randomization. So we were worried about it anyway."

The role of COX-2 inhibitors in chronic pain years after surgery is also called into question.

"Scott suggested that Celebrex, given around the time of surgery for a few days helped reduce the incidence of chronic pain a year later, but that work was retracted," Dr. Eisenach said. "So we'll have to repeat the research to know if that's true or not."

He noted that since the work only entailed a study, he doubts "most clinicians in regular practice picked up on that and started using it."

Another area that needs to be re-evaluated is the "preemptive" effect of NSAIDs and COX-2 inhibitors, according to Paul F. White, M.D., Ph.D., of University of Texas Southwestern Medical Center.

In an editorial to be published online in Anesthesia & Analgesia, Dr. White noted that Dr. Reuben and his colleagues consistently reported that NSAIDs produce a preemptive effect when given before surgical incision, rather than afterwards.

Those effects include a longer duration of analgesia during surgery, less need for the use of opioids, and lower pain scores.

However, several reviews have disagreed with those findings, said Dr. White, who believes that more retractions will occur in the future.

Overall, few anesthesiologists are worried that practice will change dramatically.

"I really don't think [the retractions] will change what doctors do normally," Dr. Eisenach said. "That's not to say the work was inconsequential, but others have validated [much of the data]."

"I think it is a tragedy, and there will be some holes," Dr. Rathmell said, "but they're not enormous holes and it really isn't going to change what we do every day."

Getting Back on Track

Journal editors have already taken action to fill the vacuum left by Dr. Reuben's retracted work. Anesthesiology's Dr. Eisenach published an editorial with a call for "submission of studies reexamining the questions that seemed to be answered by Reuben."

Anesthesia & Analgesia will publish Dr. White's editorial in May, and Dr. Shafer anticipates that the journals will end up working together to determine how best to handle the potential scope of the fraud.

"For fraud this massive, we have to consider the possibility that everything has been falsified," Dr. Shafer said. "I'm hoping to work with other journals to identify those papers for which nobody can vouch for the data. If nobody can vouch for their integrity, then I think we have to consider additional retractions."

Dr. Shafer said there would be no reason to retract studies that cite Dr. Reuben's work, and he also added that he believes the co-authors on the retracted studies are also victims in the scandal.

Dr. Rathmell says the biggest victims may be participants in clinical trials.

"As researchers, we're just worried that our own patients we're enrolling in trials will have some kind of suspicion about the way we do things," he said. "The most important ramification [of the entire situation] is its effects on the public in terms of their confidence in what we do -- that's the real catastrophe here."

Пандемия «испанки» 1918-1920 гг. в контексте других гриппозных пандемий и «птичьего гриппа»

Supotnitskiy.ru, 29 апреля 2009
https://www.supotnitskiy.ru/stat/stat51.htm#zametki

Пандемия птичьего гриппа может унести от 5 до 150 млн. жизней на планете. Но случится это только в том случае, если в результате мутации вирус птичьего гриппа H5N1 сможет легко передаваться от человека к человеку.

Д. Набарро – координатор ООН по борьбе с птичьим гриппом, 2005

Содержание

Ведение

Завершившаяся шумная и дорогостоящая кампания борьбы с «птичьим гриппом», который должен был перейти в «испанку, да так почему-то и не перешел, требует подведения некоторых итогов. В этой статье сделана попытка объяснить феномен «испанки» в контексте других пандемий гриппа и исследованы научные предпосылки возможности ее возвращения в связи с эпизоотиями гриппа среди птиц.

1. Грипп до «испанки»

Первые исторически зафиксированные эпидемии гриппа. Гриппозные эпидемии XVII столетия. Гриппозные эпидемии и пандемии XVIII столетия. Гриппозные эпидемии и пандемии XI X столетия. Грипп в начале XX столетия.

...

2. Пандемия гриппа 1918 – 1920-х гг. («испанка»)

Первая волна пандемии. Вторая волна пандемии. Третья волна пандемии. Австралия и Новая Зеландия. Великобритания. Германия. Россия. США. Сопоставление «испанки» с пандемией гриппа 1889–1892 гг. Клиническая картина «испанского» гриппа. Патологоанатомические изменения при «испанском гриппе». Лечение. Исследование структуры отдельных генов вируса, вызвавшего пандемию «испанки». Эпидемические катастрофы 1918–1922 гг.

...

3. Попытка объяснения феномена «испанки»

Объяснение клиники «испанки». «Альтернативный хозяин».

...

4. Проверим себя — грипп после «испанки»

Грипп между пандемиями. Пандемия Азиатского гриппа. Пандемия Гонконгского гриппа (1968-1970 гг.). Пандемия Русского гриппа (1977 — 1978 гг.). Грипп между пандемиями.

...

5. Мог ли «птичий грипп» «унести от 5 до 150 млн. жизней на планете»?

Эпизоотии гриппа среди птиц. Пределы эволюции вирусов, вызывающих грипп птиц. Случайные паразиты человека.

... =>

Теперь сделаем некоторые обобщения по разделу.

При всей опасности вируса гриппа птиц для птицехозяйств, не было никаких научных оснований утверждать, что он, образовав рекомбинант (реассортант) с вирусом гриппа человека, вызовет «испанку», которая унесет «от 5 до 150 млн. жизней на планете».

В *основе информационной кампании* по «борьбе с птичьим гриппом» *лежало сокрытие, подлог и агрессивное искажение информации*.

Ни один крупный российский эпидемиолог (даже в ранге академика РАМН) *не выступил против профанации* проблемы гриппа в 2004-2006 гг., что является очень тревожным индикатором состояния научной этики в России вообще, и самой эпидемиологии, в частности.

Заключение

Данная статья не является констатацией события «задним числом», т. е. после прекращения пандемии птичьего гриппа 2004-2006 гг. В своих более ранних публикациях я уже указывал на тупиковость используемого Taubenberger с соавт. подхода к пониманию феномена «испанки» и на невозможность перехода «птичьего гриппа» в «испанку» (Супотницкий М.В., 2001; 2005). Феномен «испанки» во время пандемии гриппа 1918-1920-х гг. нуждается в исследовании с совершенно иной стороны, чем это имело место до последнего времени. Объектами такого исследования должны стать:

- геном людей, у которых гриппозная инфекция развивалась с геморрагическим синдром, симптомами нарушения гемодинамики и быстрым развитием осложнений со стороны легких;
- «альтернативный хозяин», на существовании которого настаивают Taubenberger с соавт., но его поиски целесообразно продолжить среди простейших водоемов и почвы.

Необходимость этих исследований вызвана периодическим повторением пандемий подобного типа, о чем свидетельствуют исторические источники. Ранними косвенными признаками возвращения пандемии «испанки» можно считать следующие:

- учащение регистрации случаев смертельных исходов при гриппе у детей, когда на первый план у погибших выступают нарушения гемодинамики и геморрагические явления. На вскрытии в легких либо не обнаруживаются пневмонические очаги, либо они носят характер мелкоочаговой геморрагической пневмонии с массивными геморрагиями в других внутренних органах. Особенную настороженность должны вызывать такие вспышки среди изолированных популяций людей, в которых преобладают родственники;
- устойчивую тенденцию к вытеснению штаммом одного подтипа вируса, вирусов гриппа других подтипов;
- рост числа регистрируемых случаев гриппа, протекающих «с выраженной интоксикацией» и осложнений гриппа среди людей в возрасте до 30 лет на фоне сообщений о неэффективности применения противовоспалительных и противовирусных препаратов.

Для самих же ученых крайне важным является *не допускать превращения науки в «третью древнейшую профессию»*.

Scie chimiche: il genocidio silenzioso
(articolo della Dottoressa Perlingieri)

TankerEnemy Blogg, 1 Maggio 2009
http://www.tankerenemy.com/2009/05/scie-chimiche-il-genocidio-silenzioso.html

Greg Szymanski ha recentemente rilanciato un articolo della Dottoressa Perlingieri intitolato "L'ultimo assalto agli Stati Uniti". Il testo della Perlingieri globalmente non aggiunge informazioni nuove, ma si segnala per la denuncia esplicita del problema "scie tossiche" e per il riferimento ad una sintomatologia riconducibile al Morgellons tra gli animali domestici e selvatici. E' un tema che approfondiremo appena possibile.

Le scie chimiche stanno uccidendo silenziosamente e lentamente un numero non quantificabile di persone, secondo credibili ricercatori.

Raramente passa un giorno in cui i cieli non siano solcati di linee bianche prodotte dai tankers chimici.

Dopo che le chemtrails sono state create, permangono nel cielo formando dense ed innaturali nuvole. Molte persone pensano che queste scie siano dovute a fenomeni di condensazione del vapore acqueo e non collegano le bianche strisce di primo mattino con le coperture del pomeriggio.

Pubblico un articolo della dottoressa Ilya Sandra Perlingieri intitolato "L'ultimo assalto agli Stati Uniti", inviato al sito Arctic Beacon e che illustra il problema "scie chimiche".

Negli ultimi due giorni è stato sferrato un drammatico attacco chimico in gran parte della Nuova Inghilterra ed anche sulla costa occidentale.

Venerdì mattina, 17 aprile 2009, ore 06:00, il cielo era di un vibrante profondo rossastro, tratteggiato di un nero sintetico. Da metà mattinata la copertura nuvolosa è diventata del tutto artificiale con *chemtrails* che sono associate al morbo di Morgellons ed ai filamenti polimerici di questa malattia.

Più tardi, nella mattina, si contavano più di otto aerei nel cielo che compivano, contemporaneamente, il loro sporco lavoro, disegnando miglia e miglia di linee parallele.

Come potrebbe qualcuno pensare che ciò sia normale?

Con quest'ultima offensiva tossica, ora l'aria ha l'odore di sostanze chimiche. Non esiste nulla più di simile all'aria pura. Da metà pomeriggio, il cielo era completamente coperto da una patina bianco-grigiastra che è durata sino a sabato.

Esistono molte testimonianze di malattie respiratorie difficili da curare (rinite, tosse, bronchite, polmonite). I bambini e le persone anziane sembrano quelli colpiti maggiormente. Spesso sono necessarie settimane e settimane per guarire da queste malattie (a volte due mesi). Ciò che i medici diagnosticano come rinite o bronchite è costituito in realtà da forme non usuali che non esistevano prima del 2000. I farmaci sembrano non essere efficaci, mentre le medicine alternative giovano un po' di più. Le malattie dell'apparato respiratorio sono oggi la terza causa di morte.

Tutti i mammiferi sono colpiti: perciò anche gli animali. I gatti ed i cani manifestano derma infiammato e pruriginoso. Sintomi simili si notano anche negli animali degli allevamenti (mucche, pecore, maiali e capre). Nella mia tenuta ed in quella dei miei vicini, gli scoiattoli, i ricci e gli occasionali procioni sono sempre intenti a grattarsi.

Sembra che la situazione per i mammiferi peggiori quando si crea una copertura uniforme di veleni chimici.

Quest'anno non si notano zanzare o altri insetti.

Nel 2003 Clifford Carnicom, in una sua indagine, intervistò alcuni insiders i quali affermarono che il Pentagono e le industrie farmaceutiche sono coinvolte nelle irrorazioni clandestine. [1]

Il nostro sistema immunitario è sotto attacco ogni giorno e sta collassando a causa di questa cronica attività di avvelenamento decisa dai governi. Gli elementi chimico-biologici usati (bario, alluminio, batteri e virus) compromettono le capacità di autoguarigione del nostro organismo. Stiamo respirando ogni giorno questi veleni. Quali conseguenze sono stati causate, diffondendo ogni giorno alluminio che danneggia il cervello? [2]

In questo periodo vengono pubblicati articoli dell'attuale illegale amministrazione Obama che intende sviluppare la geoingegneria. Con bugie ed inganni che si affastellano per abbindolare le masse, affermano di voler "combattere il riscaldamento globale". Eppure la maggioranza degli scienziati oggi sta dichiarando che non esiste il riscaldamento globale, piuttosto il nostro pianeta sta subendo dei cambiamenti climatici dovuti alle operazioni clandestine di aerosol. Ciò non bisogna dire: che i singoli cittadini non hanno provocato danni significativi alla biosfera, mentre o sfruttamento indiscriminato delle risorse naturali continua ad un ritmo sfrenato, ma di ciò sono responsabili soprattutto le multinazionali che continuano ad accumulare profitti: a queste società non interessa la massiccia distruzione degli ecosistemi. Noi comuni cittadini rimaniamo sull'apice di una ragnatela avvelenata ed in procinto di cadere.

La terra sta mostrando segni di raffreddamento e sono stati pubblicati numerosi studi scientifici che lo confermano. L'ultimo rapporto dell'I.P.C.C. è stato un fallimento e non ha incluso alcuni importanti fenomeni, come l'attività solare. [3]

Quanti cambiamenti climatici sono invece stati provocati, negli ultimi dieci anni, da più di sessanta differenti programmi di modificazione meteorologica clandestini. Sono programmi militari, privati e "pubblici", ossia si usa il denaro dei contribuenti per avvelenarli. Nessuno di questi programmi è stato mai preceduto da una discussione pubblica.

In un volo recente attraverso gli Stati uniti, tra lo stato dello Iowa ed il Grand Canyon, ho contato dieci aerei che stavano rilasciando scie grigio-nerastre. Un aereo volava perpendicolare al nostro corridoio e sotto di noi: e vi si leggeva la parola "United". Proprio così! Almeno un velivolo che

rilasciava questi aerosol apparteneva alla *United Airlines*. Qualcun altro ricercatore ha notizie di scie nere? Quali veleni contengono?

Milioni di persone conoscono l'estrema minaccia costituita dalle scie chimiche. Molti comuni cittadini hanno analizzato il suolo, l'acqua e la neve e trovato pericolose concentrazioni di veleni. Sino a quando saremo cavie di questi quotidiani assalti mortali? Quando ci sveglieremo e porremo fine a questa criminale attività?

Noi ci troviamo di fronte ad un collasso non solo della nostra economia, ma soprattutto della nostra salute. Inoltre, poiché ogni argomento di scottante attualità è inserito in compartimenti stagni, invece di abbracciarlo con uno sguardo interdisciplinare e di considerarne tutti gli addentellati, non ci accorgiamo dell'avvelenamento quotidiano, fino a quando non capiamo quanto è fragile la nostra salute. Stiamo sperimentando il metodo di Ponzi degli "Illuminati". La loro è la ricetta per il disastro.

Ogni funzionario e banchiere corrotto, che ci sta portando verso la catastrofe, deve essere accusato e ritenuto responsabile. Sono gli autori di crisi ininterrotte che hanno deliberatamente creato.

Dobbiamo fare *tabula rasa*.

THE TIMES

John Harlow

Billionaire club in bid to curb overpopulation: America's richest people meet to discuss ways of tackling a 'disastrous' environmental, social and industrial threat

The Sunday Times, Los Angeles, 24 May 2009, 1.00am BST,
https://www.thetimes.com/world/us-world/article/billionaire-club-in-bid-to-curb-overpopulation-d2fl22qhl02?region=global
https://web.archive.org/web/20250315042349/https://www.thetimes.com/world/us-world/article/billionaire-club-in-bid-to-curb-overpopulation-d2fl22qhl02?region=global

Some of America's leading billionaires have met secretly to consider how their wealth could be used to slow the growth of the world's population and speed up improvements in health and education.

The philanthropists who attended a summit convened on the initiative of Bill Gates, the Microsoft co-founder, discussed joining forces to overcome political and religious obstacles to change.

Described as the Good Club by one insider it included David Rockefeller Jr, the patriarch of America's wealthiest dynasty, Warren Buffett and George Soros, the financiers, Michael Bloomberg, the mayor of New York, and the media moguls Ted Turner and Oprah Winfrey.

These members, along with Gates, have given away more than £45 billion since 1996 to causes ranging from health programmes in developing countries to ghetto schools nearer to home.

They gathered at the home of Sir Paul Nurse, a British Nobel prize biochemist and president of the private Rockefeller University, in Manhattan on May 5. The informal afternoon session was so discreet that some of the billionaires' aides were told they were at "security briefings".

Stacy Palmer, editor of the Chronicle of Philanthropy, said the summit was unprecedented. "We only learnt about it afterwards, by accident. Normally these people are happy to talk good causes, but this is different - maybe because they don't want to be seen as a global cabal," he said.

Some details were emerging this weekend, however. The billionaires were each given 15 minutes to present their favourite cause. Over dinner they discussed how they might settle on an "umbrella cause" that could harness their interests.

The issues debated included reforming the supervision of overseas aid spending to setting up rural schools and water systems in developing countries. Taking their cue from Gates they agreed that overpopulation was a priority.

This could result in a challenge to some Third World politicians who believe contraception and female education weaken traditional values.

Gates, 53, who is giving away most of his fortune, argued that healthier families, freed from malaria and extreme poverty, would change their habits and have fewer children within half a generation.

At a conference in Long Beach, California, last February, he had made similar points. "Official projections say the world's population will peak at 9.3 billion [up from 6.6 billion today] but with charitable initiatives, such as better reproductive healthcare, we think we can cap that at 8.3 billion," Gates said then.

Patricia Stonesifer, former chief executive of the Bill and Melinda Gates Foundation, which gives more than £2 billion a year to good causes, attended the Rockefeller summit. She said the billionaires met to "discuss how to increase giving" and they intended to "continue the dialogue" over the next few months.

Another guest said there was "nothing as crude as a vote" but a consensus emerged that they would back a strategy in which population growth would be tackled as a potentially disastrous environmental, social and industrial threat.

"This is something so nightmarish that everyone in this group agreed it needs big-brain answers," said the guest. "They need to be independent of government agencies, which are unable to head off the disaster we all see looming."

Why all the secrecy? "They wanted to speak rich to rich without worrying anything they said would end up in the newspapers, painting them as an alternative world government," he said.

Paul Joseph Watson

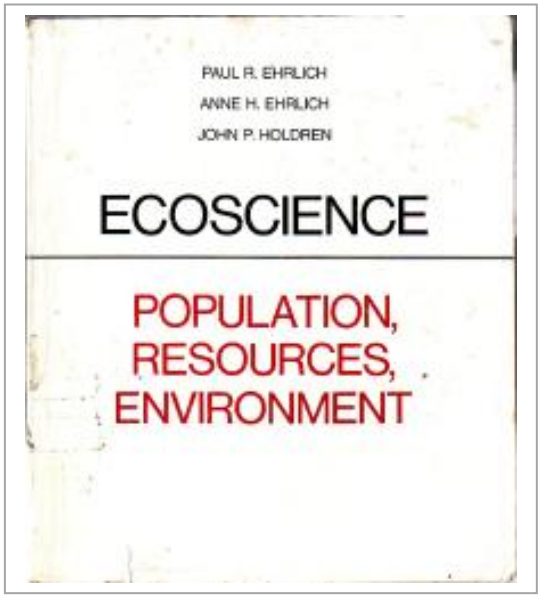
Obama Science Advisor Called For "Planetary Regime" To Enforce Totalitarian Population Control Measures

Prison Planet, 11 July 2009

https://web.archive.org/web/20090918204751/http://www.prisonplanet.com/obama-science-advisor-called-for-planetary-regime-to-enforce-totalitarian-population-control-measures.html

In 1977 book, John Holdren advocated forced abortions, mass sterilization through food and water supply and mandatory bodily implants to prevent pregnancies.

President Obama's top science and technology advisor John P. Holdren co-authored a 1977 book in which he advocated the formation of a "planetary regime" that would use a "global police force" to enforce totalitarian measures of population control, including forced abortions, mass sterilization programs conducted via the food and water supply, as well as mandatory bodily implants that would prevent couples from having children.



The concepts outlined in Holdren's 1977 book *Ecoscience*, which he co-authored with close colleagues Paul Ehrlich and Anne Ehrlich, were so shocking that a February 2009 Front Page Magazine story on the subject was largely dismissed as being outlandish because people couldn't bring themselves to believe that it could be true.

It was only when another Internet blog obtained the book and posted screenshots that the awful truth about what Holdren had actually committed to paper actually began to sink in.

This issue is more prescient than ever because Holdren and his colleagues are now at the forefront of efforts to combat "climate change" through similarly insane programs focused around geoengineering

the planet. As we reported in April, Holdren recently advocated "Large-scale geo-engineering projects designed to cool the Earth," such as "shooting pollution particles into the upper atmosphere to reflect the sun's rays," which many have pointed out is already occurring via chemtrails.

Ecoscience discusses a number of ways in which the global population could be reduced to combat what the authors see as mankind's greatest threat – overpopulation. In each case, the proposals are couched in sober academic rhetoric, but the horrifying foundation of what Holdren and his co-authors are advocating is clear. These proposals include;

> - Forcibly and unknowingly sterilizing the entire population by adding infertility drugs to the nation's water and food supply.
>
> - Legalizing "compulsory abortions," ie forced abortions carried out against the will of the pregnant women, as is common place in Communist China where women who have already had one child and refuse to abort the second are kidnapped off the street by the authorities before a procedure is carried out to forcibly abort the baby.
>
> - Babies who are born out of wedlock or to teenage mothers to be forcibly taken away from their mother by the government and put up for adoption. Another proposed measure would force single mothers to demonstrate to the government that they can care for the child, effectively introducing licensing to have children.
>
> - Implementing a system of "involuntary birth control," where both men and women would be mandated to have an infertility device implanted into their body at puberty and only have it removed temporarily if they received permission from the government to have a baby.
>
> - Permanently sterilizing people who the authorities deem have already had too many children or who have contributed to "general social deterioration".
>
> - Formally passing a law that criminalizes having more than two children, similar to the one child policy in Communist China.
>
> - This would all be overseen by a transnational and centralized "planetary regime" that would utilize a "global police force" to enforce the measures outlined above. The "planetary regime" would also have the power to determine population levels for every country in the world.

The quotes from the book are included below. We also include comments by the author of the blog who provided the screenshots of the relevant passages. Screenshots of the relevant pages and the quotes in their full context are provided at the end of the excerpts. The quotes from the book appear as text indents and in bold. The quotes from the author of the blog are italicized.

Page 837: Compulsory abortions would be legal

> "Indeed, it has been concluded that compulsory population-control laws, even including laws requiring compulsory abortion, could be sustained under the existing Constitution if the population crisis became sufficiently severe to endanger the society."

As noted in the FrontPage article cited above, Holdren "hides behind the passive voice" in this passage, by saying "it has been concluded." Really? By whom? By the authors of the book, that's whom. What Holdren's really saying here is, "I have determined that there's nothing unconstitutional about laws which would force women to abort their babies." And as we will see later, although Holdren bemoans the fact that most people think there's no need for such laws, he and his co-authors believe that the population crisis is so severe that the time has indeed come for "compulsory population-control laws." In fact, they spend the entire book arguing that "the population crisis" has already become "sufficiently severe to endanger the society."

Page 786: Single mothers should have their babies taken away by the government; or they could be forced to have abortions

> "One way to carry out this disapproval might be to insist that all illegitimate babies be put up for adoption – especially those born to minors, who generally are not capable of caring properly for a child alone. If a single mother really wished to keep her baby, she might be obliged to go through adoption proceedings and demonstrate her ability to support and care for it. Adoption proceedings probably should remain more difficult for single people than for married couples, in recognition of the relative difficulty of raising children alone. It would even be possible to require pregnant single women to marry or have abortions, perhaps as an alternative to placement for adoption, depending on the society."

Holdren and his co-authors once again speculate about unbelievably draconian solutions to what they feel is an overpopulation crisis. But what's especially disturbing is not that Holdren has merely made these proposals – wrenching babies from their mothers' arms and giving them away; compelling single mothers to prove in court that they would be good parents; and forcing women to have abortions, whether they wanted to or not – but that he does so in such a dispassionate, bureaucratic way. Don't be fooled by the innocuous and "level-headed" tone he takes: the proposals are nightmarish, however euphemistically they are expressed.

Holdren seems to have no grasp of the emotional bond between mother and child, and the soul-crushing trauma many women have felt throughout history when their babies were taken away from them involuntarily.

This kind of clinical, almost robotic discussion of laws that would affect millions of people at the most personal possible level is deeply unsettling, and the kind of attitude that gives scientists a bad name. I'm reminded of the phrase "banality of evil."

Not that it matters, but I myself am "pro-choice" – i.e. I think that abortion should not be illegal. But that doesn't mean I'm pro-abortion – I don't particularly like abortions, but I do believe women should be allowed the choice to have them. But John Holdren here proposes to take away that choice – to force women to have abortions. One doesn't need to be a "pro-life" activist to see the horror of this proposal – people on all sides of the political spectrum should be outraged. My objection to forced abortion is not so much to protect the embryo, but rather to protect the mother from undergoing a medical procedure against her will. And not just any medical procedure, but one which she herself (regardless of my views) may find particularly immoral or traumatic.

There's a bumper sticker that's popular in liberal areas which says: "Against abortion? Then don't have one." Well, John Holdren wants to MAKE you have one, whether you're against it or not.

Page 787-8: Mass sterilization of humans though drugs in the water supply is OK as long as it doesn't harm livestock

> "Adding a sterilant to drinking water or staple foods is a suggestion that seems to horrify people more than most proposals for involuntary fertility control. Indeed, this would pose some very difficult political, legal, and social questions, to say nothing of the technical problems. No such sterilant exists today, nor does one appear to be under development. To be acceptable, such a substance would have to meet some rather stiff requirements: it must be uniformly effective, despite widely varying doses received by individuals, and despite varying degrees of fertility and sensitivity among individuals; it must be free of dangerous or unpleasant side effects; and it must have no effect on members of the opposite sex, children, old people, pets, or livestock."

OK, John, now you're really starting to scare me. Putting sterilants in the water supply? While you correctly surmise that this suggestion "seems to horrify people more than most proposals," you apparently are not among those people it horrifies. Because in your extensive list of problems with this possible scheme, there is no mention whatsoever of any ethical concerns or moral issues. In your view, the only impediment to involuntary mass sterilization of the population is that it ought to affect everyone equally and not have any unintended side effects or hurt animals. But hey, if we could sterilize all the humans safely without hurting the livestock, that'd be peachy! The fact that Holdren has no moral qualms about such a deeply invasive and unethical scheme (aside from the fact that it would be difficult to implement) is extremely unsettling and in a sane world all by itself would disqualify him from holding a position of power in the government.

Page 786-7: The government could control women's reproduction by either sterilizing them or implanting mandatory long-term birth control

> Involuntary fertility control
> "A program of sterilizing women after their second or third child, despite the relatively greater difficulty of the operation than vasectomy, might be easier to implement than trying to sterilize men.
> The development of a long-term sterilizing capsule that could be implanted under the skin and removed when pregnancy is desired opens additional possibilities for coercive fertility control. The capsule could be implanted at puberty and might be removable, with official permission, for a limited number of births."

Note well the phrase "with official permission" in the above quote. John Holdren envisions a society in which the government implants a long-term sterilization capsule in all girls as soon as they reach puberty, who then must apply for official permission to temporarily remove the capsule and be allowed to get pregnant at some later date. Alternately, he wants a society that sterilizes all women once they have two children. Do you want to live in such a society? Because I sure as hell don't.

Page 838: The kind of people who cause "social deterioration" can be compelled to not have children

> "If some individuals contribute to general social deterioration by overproducing children, and if the need is compelling, they can be required by law to exercise reproductive responsibility–just as they can be required to exercise responsibility in their resource-consumption patterns–providing they are not denied equal protection."

To me, this is in some ways the most horrifying sentence in the entire book – and it had a lot of competition. Because here Holdren reveals that moral judgments would be involved in determining who gets sterilized or is forced to abort their babies. Proper, decent people will be left alone – but those who "contribute to social deterioration" could be "forced to exercise reproductive responsibility" which could only mean one thing – compulsory abortion or involuntary sterilization. What other alternative would there be to "force" people to not have children? Will government monitors be stationed in irresponsible people's bedrooms to ensure they use condoms? Will we bring back the chastity belt? No – the only way to "force" people to not become or remain pregnant is to sterilize them or make them have abortions.

But what manner of insanity is this? "Social deterioration"? Is Holdren seriously suggesting that "some" people contribute to social deterioration more than others, and thus should be sterilized or forced to have abortions, to prevent them from propagating their kind? Isn't that eugenics, plain and simple? And isn't eugenics universally condemned as a grotesquely evil practice?

We've already been down this road before. In one of the most shameful episodes in the history of U.S. jurisprudence, the Supreme Court ruled in the infamous 1927 Buck v. Bell case that the State of Virginia had had the right to sterilize a woman named Carrie Buck against her will, based solely on the (spurious) criteria that she was "feeble-minded" and promiscuous, with Justice Oliver Wendell Holmes concluding, "Three generations of imbeciles are enough." Nowadays, of course, we look back on that ruling in horror, as eugenics as a concept has been forever discredited. In fact, the United Nations now regards forced sterilization as a crime against humanity.

The italicized phrase at the end ("providing they are not denied equal protection"), which Holdren seems to think gets him off the eugenics hook, refers to the 14th Amendment (as you will see in the more complete version of this passage quoted below), meaning that the eugenics program wouldn't be racially based or discriminatory – merely based on the whim and assessments of government bureaucrats deciding who and who is not an undesirable. If some civil servant in Holdren's America determines that you are "contributing to social deterioration" by being promiscuous or pregnant or both, will government agents break down your door and and haul you off kicking and screaming to the abortion clinic? In fact, the Supreme Court case Skinner v. Oklahoma already determined that the Equal Protection Clause of the 14th Amendment distinctly prohibits state-sanctioned sterilization being applied unequally to only certain types of people.

No no, you say, Holdren isn't claiming that some kind of people contribute to social deterioration more than others; rather, he's stating that anyone who overproduces children thereby contributes to social deterioration and needs to be stopped from having more. If so – how is that more palatable? It seems Holdren and his co-authors have not really thought this through, because what they are suggesting is a nightmarish totalitarian society. What does he envision: All women who commit the crime of having more than two children be dragged away by police to the government-run sterilization centers? Or – most disturbingly of all – perhaps Holdren has thought it through, and is perfectly OK with the kind of dystopian society he envisions in this book.

Sure, I could imagine a bunch of drunken guys sitting around shooting the breeze, expressing these kinds of forbidden thoughts; who among us hasn't looked in exasperation at a harried mother buying candy bars and soda for her immense brood of unruly children and thought: Lady, why don't you just get your tubes tied already? But it's a different matter when the Science Czar of the United States suggests the very same thing officially in print. It ceases being a harmless fantasy, and suddenly the possibility looms that it could become government policy. And then it's not so funny anymore.

Page 838: Nothing is wrong or illegal about the government dictating family size

> "In today's world, however, the number of children in a family is a matter of profound public concern. The law regulates other highly personal matters. For example, no one may lawfully have more than one spouse at a time. Why should the law not be able to prevent a person from having more than two children?"

Why should the law not be able to prevent a person from having more than two children? Why?

I'll tell you why, John. Because the the principle of habeas corpus upon which our nation rests automatically renders any compulsory abortion scheme to be unconstitutional, since it guarantees the freedom of each individual's body from detention or interference, until that person has been convicted of a crime. Or are you seriously suggesting that, should bureaucrats decide that the country is overpopulated, the mere act of pregnancy be made a crime?

I am no legal scholar, but it seems that John Holdren is even less of a legal scholar than I am. Many of the bizarre schemes suggested in Ecoscience rely on seriously flawed legal reasoning. The book is not so much about science, but instead is about reinterpreting the Constitution to allow totalitarian population-control measures.

Page 942-3: A "Planetary Regime" should control the global economy and dictate by force the number of children allowed to be born

> Toward a Planetary Regime
>
> "Perhaps those agencies, combined with UNEP and the United Nations population agencies, might eventually be developed into a Planetary Regime—sort of an international superagency for population, resources, and environment. Such a comprehensive Planetary Regime could control the development, administration, conservation, and distribution of all natural resources, renewable or nonrenewable, at least insofar as international implications exist. Thus the Regime could have the power to control pollution not only in the atmosphere and oceans, but also in such freshwater bodies as rivers and lakes that cross international boundaries or that discharge into the oceans. The Regime might also be a logical central agency for regulating all international trade, perhaps including assistance from DCs to LDCs, and including all food on the international market."
>
> "The Planetary Regime might be given responsibility for determining the optimum population for the world and for each region and for arbitrating various countries' shares within their regional limits. Control of population size might remain the responsibility of each government, but the Regime would have some power to enforce the agreed limits."

In case you were wondering exactly who would enforce these forced abortion and mass sterilization laws: Why, it'll be the "Planetary Regime"! Of course! I should have seen that one coming.

The rest of this passage speaks for itself. Once you add up all the things the Planetary Regime (which has a nice science-fiction ring to it, doesn't it?) will control, it becomes quite clear that it will have total power over the global economy, since according to Holdren this Planetary Regime will control "all natural resources, renewable or nonrenewable" (which basically means all goods)

as well as all food, and commerce on the oceans and any rivers "that discharge into the oceans" (i.e. 99% of all navigable rivers). What's left? Not much.

Page 917: We will need to surrender national sovereignty to an armed international police force

> "If this could be accomplished, security might be provided by an armed international organization, a global analogue of a police force. Many people have recognized this as a goal, but the way to reach it remains obscure in a world where factionalism seems, if anything, to be increasing. The first step necessarily involves partial surrender of sovereignty to an international organization."

The other shoe drops. So: We are expected to voluntarily surrender national sovereignty to an international organization (the "Planetary Regime," presumably), which will be armed and have the ability to act as a police force. And we saw in the previous quote exactly which rules this armed international police force will be enforcing: compulsory birth control, and all economic activity.

It would be laughable if Holdren weren't so deadly serious. Do you want this man to be in charge of science and technology in the United States? Because he already is in charge.

Page 749: Pro-family and pro-birth attitudes are caused by ethnic chauvinism

> "Another related issue that seems to encourage a pronatalist attitude in many people is the question of the differential reproduction of social or ethnic groups. Many people seem to be possessed by fear that their group may be outbred by other groups. White Americans and South Africans are worried there will be too many blacks, and vice versa. The Jews in Israel are disturbed by the high birth rates of Israeli Arabs, Protestants are worried about Catholics, and Ibos about Hausas. Obviously, if everyone tries to outbreed everyone else, the result will be catastrophe for all. This is another case of the "tragedy of the commons," wherein the "commons" is the planet Earth. Fortunately, it appears that, at least in the DCs, virtually all groups are exercising reproductive restraint."

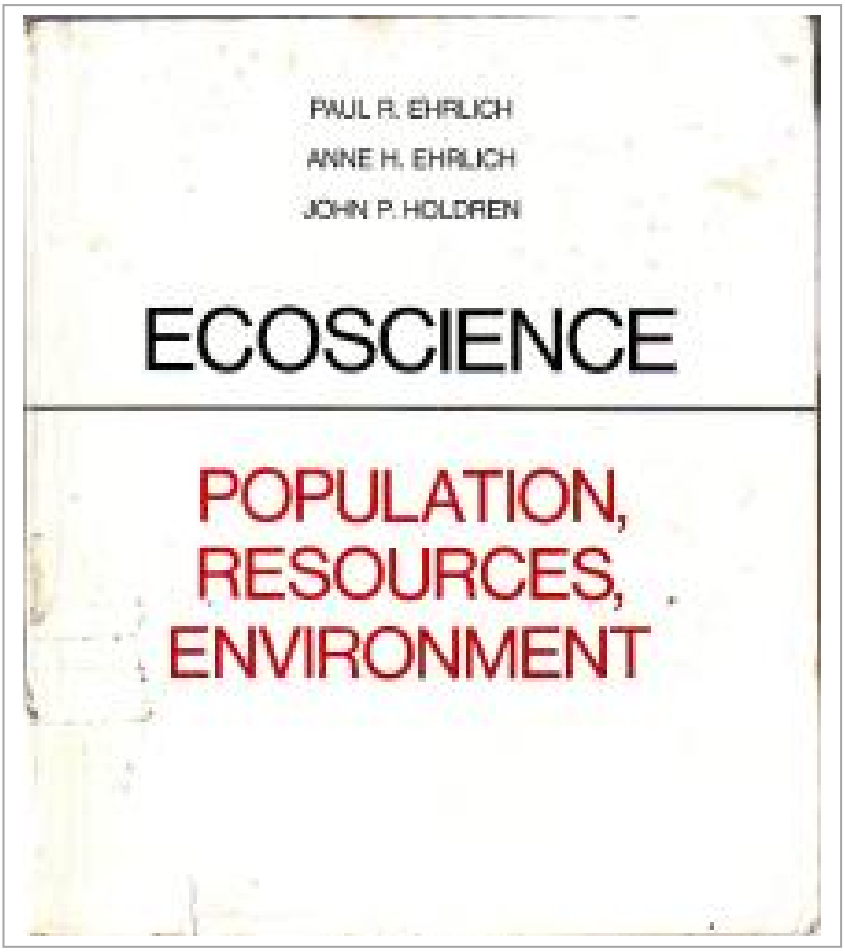
This passage is not particularly noteworthy except for the inclusion of the odd phrase "pronatalist attitude," which Holdren spends much of the book trying to undermine. And what exactly is a "pronatalist attitude"? Basically it means the urge to have children, and to like babies. If only we could suppress people's natural urge to want children and start families, we could solve all our problems!

What's disturbing to me is the incredibly patronizing and culturally imperialist attitude he displays here, basically acting like he has the right to tell every ethnic group in the world that they should allow themselves to go extinct or at least not increase their populations any more. How would we feel if Andaman Islanders showed up on the steps of the Capitol in Washington D.C. and announced that there were simply too many Americans, and we therefore are commanded to stop breeding immediately? One imagines that the attitude of every ethnic group in the world to John Holdren's proposal would be: Cram it, John. Stop telling us what to do.

Page 944: As of 1977, we are facing a global overpopulation catastrophe that must be resolved at all costs by the year 2000

> "Humanity cannot afford to muddle through the rest of the twentieth century; the risks are too great, and the stakes are too high. This may be the last opportunity to choose our own and our descendants' destiny. Failing to choose or making the wrong choices may lead to catastrophe. But it must never be forgotten that the right choices could lead to a much better world."

This is the final paragraph of the book, which I include here only to show how embarrassingly inaccurate his "scientific" projections were. In 1977, Holdren thought we were teetering on the brink of global catastrophe, and he proposed implementing fascistic rules and laws to stave off the impending disaster. Luckily, we ignored his warnings, yet the world managed to survive anyway without the need to punish ourselves with the oppressive society which Holdren proposed. Yes, there still is overpopulation, but the problems it causes are not as morally repugnant as the "solutions" which John Holdren wanted us to adopt.



Paul R. Ehrlich, Anne H. Ehrlich, John P. Holdren

Ecoscience: Population, Resources, Environment

A comprehensive introduction to basic ecological principlees. Offers an expanded treatment of raw materials; a major section is devoted to energy problems; new coverage is given to geophysical and climatological aspects of the environment; and a provocative discussion of the possiblities of social, politcal, and economic change is also included.

VACTRUTH
BECAUSE YOU CAN HANDLE THE TRUTH!

Dr. Andrew Moulden (Interview): What you were never told about vaccines

VacTruth, 21 July 2009, 7:48 AM
https://web.archive.org/web/20090804101942/http://vactruth.com/2009/07/21/dr-andrew-moulden-interview-what-you-were-never-told-about-vaccines/

Interview with Dr. Andrew Moulden
(*English Version* 07/21/09)

1) Dr. Moulden, can you tell us a bit about your background?

I am 44 years of age and have spent my entire adult life in academia, university, and clinical health science studies, practice, and research. My affinity for the brain and behavioral sciences stemmed from a genuine desire to find answers to many unanswered questions, questions such as – Why are we here? What makes us human? and What causes illnesses like schizophrenia, dementia, multiple sclerosis, learning disabilities, and many other often debilitating illnesses. My area of expertise is in neurobehavioral assessment of brain and behavioral disorders – www.BrainGuardMD.com

…

2) Dr. Moulden, we understand that you have made a revolutionary discovery. Can you tell us about it?

I would be happy to.

Through my extensive research and my work throughout the years, I have discovered that vaccinations are causing impaired blood flow (ischemia) to brain and body from clinically silent to death. These are strokes – across the board for all of us. I have reason to believe that all are being affected and all vaccinations ARE causing the overwhelming rise in autism, specific learning disabilities, attention deficit disorders, sudden infant death, gulf war syndrome, dementia, seizure disorders, some cancers it would appear, and much much more.

3) What led you away from the rigid and possibly blinkered views of most of the rest of the medical profession?

The brain and nervous system is wired in a very specific format. Functions are localized to specific areas. Having studied brain and behavior, neurosciences, clinical neuropsychology, child neurodevelopment, functional brain imaging, clinical neurology, clinical neuropsychiatry, clinical medicine, immunology, hematology, tests and measurement, and understanding the tools and assumptions and techniques of mainstream medicine, I fell in the unique position of having being able to see clinical medicine problems, from a multitude of simultaneous areas of expertise and scientific knowledge. Relative to the human brain, I understood "rules and laws" of brain function relative to brain damage and the mechanisms of medical physiology that can uniquely cause unique patterns of brain damage in ways that my clinical skills could detect, that mainstream neuroimaging cannot. The initial "aha" moment was in 2001.

4) What was it which caught your attention, what tipped you off and incited you to scratch the surface and investigate further?

=>See: https://web.archive.org/web/20090804101942/http://vactruth.com/2009/07/21/dr-andrew-moulden-interview-what-you-were-never-told-about-vaccines/

Dramatic moment man who 'threatened to blow up the White House' is tasered by police after eight-hour stand-off

Daily Mail, 14 August 2009, 17:42 BST,
https://www.dailymail.co.uk/news/article-1206515/Dramatic-moment-man-threatened-blow-White-House-Tasered-police-hour-stand-off.html

This is the moment a man making threats against the White House was finally seized from his car after an eight-hour stand-off.

The drama unfolded on Wednesday when the man, identified as Joseph Moshe, called a police dispatch number and threatened to blow up the White House, according to reports.

Officers then spotted his red Volkswagen Beetle at about 10am and pursued him through the west side of Los Angeles.

Moshe headed to the federal building parking area and drove around it once before a police SUV blocked him as he tried to return to the street. Authorities then surrounded his car with police cruisers and a large armored vehicle.

The federal building was locked down at noon and employees were told to stay inside.

The man then sat in the car smoking for hours before a robot broke a rear window of the car so officers could see inside and try to communicate. However Moshe did not respond, said a police spokesman.

A police robot manoeuvred next to the driver's door, and an armored vehicle parked in front of the vehicle so the man could not escape.

Police then fired tear gas into the suspect's vehicle in an attempt to force him to surrender.

But Moshe remained inside the car and briefly wound down the passenger window to let out the fumes.

He withstood four rounds of chemical agents before officers shot out the drivers' window with a bean bag gun.

Officers then used a Taser to restrain him before finally pulling him out of the car.

Detective Gus Villanueva said Moshe was booked on two previous unrelated misdemeanor warrants but did not provide details. Officials later said he was taken to a hospital for observation.

Asked how the man was able to withstand multiple rounds of tear gas, Villanueva said some people are able to resist the chemicals.

'I can't explain that, there's no way to explain that,' he said.

Who Is Joseph Moshe?

Godlike Productions, User ID: 574264, 16 August 2009

Sourse: http://www.godlikeproductions.com/forum1/message861009/pg1

"Joseph Moshe (Moshe is the man's middle name) is a bio-scientist. He works (worked?) for a unit within Mossad. He is an Israeli citizen.

The Secret Service was not the agency involved in the surveillance of Moshe at his home in California. This was done by the FBI, who had orders to detain him, or "bring him in."

Moshe did not send a threat to the White House. Rather, he communicated that he intended to go public with information he had regarding the flu vaccine that is being prepared by Baxter Labs, an Austrian company.

The information is this: The vaccine is being manufactured in Ukraine. It is not a vaccine at all, but rather an engineered genetically mutated bio-weapon meant to cause sickness and death. Moshe informed the White House he intended to go public with this information. When he became aware that the FBI was about to detain him, he packed some belongings in his car and set out for the Israeli consulate, located in close proximity to the federal building where the standoff took place. FBI pursuit kept him from reaching his destination.

Mounted on top of the large black vehicle was a microwave weapon which fried the electronics in Moshe's car as well as any communication devices he had which might have been used to contact the media or others who could help him.

Moshe did not suffer the same effects of the gas and pepper spray that others would have because he had built up an immunity to such weapons as a by-product of his Mossad training.

Moshe was not handcuffed because he was not placed under arrest. After leaving police or FBI custody, he returned to Israel, where he is at this time.

The information comes from one of my confidential sources. I have reason to believe it is accurate. If I receive more information, I will post it."

THE FLU CASE

Joseph Moshe: (MOSSAD Microbiologist)
"Swine flu vaccine is bioweapon"

The Flu Case, 21 August 2009

https://web.archive.org/web/20091102052516/http://www.theflucase.com/index.php?option=com_content&view=article&id=700%3Amicrobiologist-alleges-baxter-qswine-fluq-vaccine-is-a-bioweapon&Itemid=64

Joseph Moshe (MOSSAD Microbiologist)

Today, the MSM are not talking about this case any more. <...>

Professor Moshe had called into a live radio show by Dr. A. True Ott, (explanation of Joseph Moshe's call at 06:00) broadcast on Republic Broadcasting claiming to be a microbiologist who wanted to supply evidence to a States Attorney regarding tainted H1N1 Swine flu vaccines being produced by Baxter BioPharma Solutions. He said that Baxter's Ukrainian lab was in fact producing a bioweapon disguised as a vaccine.

He claimed that the vaccine contained an adjuvant (additive) designed to weaken the immune system, and replicated RNA from the virus responsible for the 1918 pandemic Spanish flu, causing global sickness and mass death. <...>

Does this sound like an insane conspiracy theory? Sure it does. Due to the scarcity and anonimity of the sources we would dismiss it as exactly that, if it weren't for some uncomfortable facts: Baxter Pharmaceutical has been caught, red-handed, in spreading a live, genetically engineered H5N1 Bird flu vaccine as a lethal biological weapon all over the world, destined to be used for human vaccinations. This happened just a few months ago. And only luck prevented a global catastrophe of epic proportions.

Baxter International Inc. had mixed live, genetically engineered avian flue viruses in vaccine material shipped to 18 countries. Only by sheer luck, a Czech laboratory decided to test the vaccine on a dozen ferrets, which all died in days. The World Health Organization was notified and catastrophe was averted. This was clearly a deliberate act on Baxter's part, because they adhere to BS3, bio-safety level three. Baxter admitted a "mistake". Such monumental screwups are totally impossible at that level. Many safety systems would have needed to be sabotaged, many key personell would have needed to be bribed. It simply can't be done without direction from the inside. They did not send out the wrong vial – they produced dozens of gallons of biological-weapon agent (genetically engineered live H5N1 / Bird flu virus), then sent it out as a "vaccine".

Baxter knew full well that their vaccine was lethal, because the year before they had tested it on a few hundred homeless Polish people – dozens died as a result. [See: Next page]

Zeiten Schrift

Bevölkerungsreduktion: Lauert in der Spritze der Tod?

Zeiten Schrift, 2010, Quartal 1, N 65
https://www.zeitenschrift.com/heft/zeitenschrift-65

Seuchen können in kurzer Zeit mehr Menschen dahinraffen als Krieg und Hunger. Was, wenn man sich dies zunutze machen würde? Werden Impfungen benutzt, um die Menschheit zu dezimieren?

...

Vorahnungen oder Insiderwissen?

Blenden wir einige Wochen weiter zurück in ein mehrere tausend Kilometer entferntes Aufnahmestudio des amerikanischen Radiosenders Republic Broadcasting. Am 11. August 2009 hatte Radiomoderator Dr. True Ott einen höchst merkwürdigen Telefonanruf mitten in seine Live-Sendung erhalten. Darin klärte ein gewisser Joseph Moshe die erstaunten Radiohörer darüber auf, daß er ein Mikrobiologe sei und hochbrisante Beweise besitze, die er einem Staatsanwalt übergeben wolle. Es gehe um einen verunreinigten H1N1-Schweinegrippeimpfstoff, den das amerikanische Pharmaunternehmen Baxter in der Ukraine herstelle. Dabei handle es sich in Tat und Wahrheit um eine als Impfung getarnte biologische Waffe. Zu diesem Zweck, so Moshe weiter, habe man der Impfung ein Adjuvans (Zusatzstoff) beigemischt, der das Immunsystem schwächen solle und RNA-Bestandteile jenes Virus enthalte, das 1918 die Spanische Grippe mit Millionen von Toten verursachte. Der Anrufer kündigte an, daß es in der Ukraine in naher Zukunft zum Ausbruch einer Seuche kommen werde.

Die tatsächliche Identität dieses in Kalifornien lebenden Joseph Moshe ist bis heute nicht zweifelsfrei geklärt. Manche behaupten, es handle sich dabei um den israelischen Professor Moshe bar-Joseph, was jedoch mehr als fragwürdig ist. Ganz sicher wurde der ominöse Mann jedoch am Abend des 13. August 2009 vom FBI vor laufenden Fernsehkameras verhaftet.

Nach seiner Ankündigung, das Weiße Haus informieren und sämtliche Fakten der Öffentlichkeit zugänglich machen zu wollen, flüchtete Moshe nämlich mit einem roten VW Beetle quer durch Los Angeles in Richtung des israelischen Konsulats. Dieses erreichte er aber nicht, weil die Bundespolizei und ein Bombenräumungskommando mit gepanzerten Wagen sein Auto einkeilten. Mikrowellenwaffen setzten die Elektronik des VWs und Moshes Handy lahm, anschließend nebelten die Polizisten ihn mit Tränengas ein, ein ferngesteuerter Roboter zerschlug das Autofenster, man versprühte mehrere Dosen Pfefferspray, versetzte Moshe mit einem Taser Elektroschocks und zerrte den Mann schließlich unsanft ins Freie – alles zu sehen auf dem Internetportal Youtube (Stichwort „Westwood Standoff").

Was anschließend mit Joseph Moshe geschah, ist nicht bekannt. Manche spekulieren, er sei in ein Flugzeug gesetzt und nach Israel ausgeflogen worden. Als offizielle Begründung für die Verhaftung bemühten die Behörden einmal mehr die Angst vor dem Terrorismus: Joseph Moshe sei ein Verrückter, der gedroht habe, ein Bombenattentat auf das Weiße Haus zu verüben.

Baxters Beinahe-Katastrophe

Für die von Moshe vorgebrachten Anschuldigungen gegen Baxter gibt es keine offiziellen Beweise. Doch es ist nicht das erste Mal, daß der US-Pharmariese in das Kreuzfeuer der Kritik gerät. So sollen seinen Blutkonserven in der Vergangenheit Aidsviren beigemischt worden sein. Auch das läßt sich nicht beweisen ... [=> See: the main part – *Zeiten Schrift,* 2010, Quartal 1, N 65].

https://www.justice.gov/opa/pr/justice-department-announces-largest-health-care-fraud-settlement-its-history

Washington – American pharmaceutical giant Pfizer Inc. and its subsidiary Pharmacia & Upjohn Company Inc. (hereinafter together "Pfizer") have agreed to pay $2.3 billion, the largest health care fraud settlement in the history of the Department of Justice, to resolve criminal and civil liability arising from the illegal promotion of certain pharmaceutical products, the Justice Department announced today.

Pharmacia & Upjohn Company has agreed to plead guilty to a felony violation of the Food, Drug and Cosmetic Act for misbranding Bextra with the intent to defraud or mislead. Bextra is an anti-inflammatory drug that Pfizer pulled from the market in 2005. Under the provisions of the Food, Drug and Cosmetic Act, a company must specify the intended uses of a product in its new drug application to FDA. Once approved, the drug may not be marketed or promoted for so-called "off-label" uses – i.e., any use not specified in an application and approved by FDA. Pfizer promoted the sale of Bextra for several uses and dosages that the FDA specifically declined to approve due to safety concerns. The company will pay a criminal fine of $1.195 billion, the largest criminal fine ever imposed in the United States for any matter. Pharmacia & Upjohn will also forfeit $105 million, for a total criminal resolution of $1.3 billion.

In addition, Pfizer has agreed to pay $1 billion to resolve allegations under the civil False Claims Act that the company illegally promoted four drugs – Bextra; Geodon, an anti-psychotic drug; Zyvox, an antibiotic; and Lyrica, an anti-epileptic drug – and caused false claims to be submitted to government health care programs for uses that were not medically accepted indications and therefore not covered by those programs. The civil settlement also resolves allegations that Pfizer paid kickbacks to health care providers to induce them to prescribe these, as well as other, drugs. The federal share of the civil settlement is $668,514,830 and the state Medicaid share of the civil settlement is $331,485,170. This is the largest civil fraud settlement in history against a pharmaceutical company.

As part of the settlement, Pfizer also has agreed to enter into an expansive corporate integrity agreement with the Office of Inspector General of the Department of Health and Human Services. That agreement provides for procedures and reviews to be put in place to avoid and promptly detect conduct similar to that which gave rise to this matter.

Whistleblower lawsuits filed under the qui tam provisions of the False Claims Act that are pending in the District of Massachusetts, the Eastern District of Pennsylvania and the Eastern District of Kentucky triggered this investigation. As a part of today's resolution, six whistleblowers will receive payments totaling more than $102 million from the federal share of the civil recovery.

The U.S. Attorney's offices for the District of Massachusetts, the Eastern District of Pennsylvania, and the Eastern District of Kentucky, and the Civil Division of the Department of Justice handled these cases. The U.S. Attorney's Office for the District of Massachusetts led the criminal investigation of Bextra. The investigation was conducted by the Office of Inspector General for the Department of Health and Human Services (HHS), the FBI, the Defense Criminal Investigative Service (DCIS), the Office of Criminal Investigations for the Food and Drug Administration (FDA), etc. ... => see

Pfizer fined $2.3 billion for illegal marketing in off-label drug case

ABC News, 3 September 2009, 10:15 AM
https://abcnews.go.com/Business/pfizer-fined-23-billion-illegal-marketing-off-label/story?id=8477617

In the largest health care fraud settlement in history, pharmaceutical giant Pfizer must pay $2.3 billion to resolve criminal and civil allegations that the company illegally promoted uses of four of its drugs, including the painkiller Bextra, the U.S. Department of Justice announced Wednesday.

Besides Bextra, the drugs were Geodon, an antipsychotic; Zyvox, an antibiotic; and Lyrica, an anti-epileptic drug. Once the Food and Drug Administration approves drugs, doctors can prescribe them off-label for any use, but makers can't market them for anything other than approved uses.

Pfizer subsidiary Pharmacia & Upjohn pleaded guilty to a felony violation for promoting off-label uses of Bextra, such as for pain relief after knee replacement surgery. At the FDA's request, Pfizer pulled Bextra off the market in April 2005 because its risks, including a rare, sometimes fatal, skin reaction, outweighed its benefits. It had been approved only for treating rheumatoid arthritis, osteoarthritis and menstrual pain.

Pfizer also has agreed to pay $1 billion in civil damages and penalties to compensate federal health-care programs for false claims submitted as a result of its marketing Bextra and the other four drugs for off-label use or at unapproved dosages.

In an interview Wednesday with USA TODAY, former Pfizer sales representative John Kopchinski said he was told to distribute 20-milligram samples to rheumatologists and orthopedists, even though the FDA had approved only 10-milligram doses for arthritis. The 20-milligram doses were approved only for menstrual pain, yet Kopchinski says he never called on gynecologists or other doctors who would treat that complaint.

In 2003, Kopchinski, 45, a West Point graduate, filed the first whistle-blower lawsuit, leading to the Justice Department investigation. Kopchinski says he was inspired by David Franklin, who filed a whistle-blower lawsuit against Pfizer for promoting Neurontin — at the time approved only to control seizures — for unapproved uses such as treating bipolar disorder.

'Immuno-Sterilization' in Humans: A 2009 Vaccination Odyssey

Jeff Rense, 25 September 2009
https://rense.com/general87/immu.htm

According to the Los Angeles Sunday Times newspaper dated May 24, 2009, a meeting of some of the world's richest billionaires took place in Manhattan on May 5, 2009. (See addendum #1). These "elite" reached a uniform consensus during this meeting - that OVERPOPULATION is the single greatest threat facing Planet Earth.

Mr. George Soros, international banker and agent of the Rothschild family, was also in attendance, and actually led much of the discussion, it was reported. For a biography and curriculum vitae of this warped individual and his vision for mass sterilization/depopulation of the planet, see Addendum #2.

The elite's agenda of mass depopulation is no longer covert. It is no longer the realm of "National Secret Memorandums" (see NSSM-200 authored by Henry Kissinger and Zbignew Brezinsky back in 1974) It is today public knowledge. It is indeed their top "agenda" item for immediate implementation this year - 2009.

I would submit that these billionaires are men and women of action. When they come to a joint consensus, a detailed plan is quickly and decisively put into action - especially if they perceive that their "plan" is literally going to "save the planet". There should be little doubt that they would have a brilliant plan of action that they are most definitely implementing as you are reading this. These individuals did not get to be billionaires by being stupid, or by merely discussing ideas and concepts over dinner. They, of course, would also know how to keep their depopulation activities camouflaged and hidden from public scrutiny. After all, they reason that only THEY know what is best for the planet.

Let's look at the elite's depopulation plan from a standpoint of logic and common sense. Of course they realize that only a very small fraction of the world's population (especially in the Western 1st World nations) would eagerly and willingly step forward and volunteer that their lineage and bloodlines would be severed by means of a permanent sterilization "vaccination". It is obvious, therefore, that such a "sterilization vaccine" would need to be disguised as something else, a truly global false-flag program fueled by their controlled media propaganda and fear-mongering. I would submit that a worldwide faux "influenza pandemic" would be an absolutely perfect cover.

Prior to the year 1998, the available depopulation tools that could be utilized by such "global elitists" were fairly limited; diseases, famine, wars and even natural disasters could each be developed and actually implemented by a designed plan. These depopulation tools are rather messy, however, and often hard to completely control. However, thanks to the work of Dr. Richard A. Fayrer -Hosken at the University of Georgia, a new and completely effective depopulation tool is now available - indeed, a simple little VACCINE SHOT can today cause permanent sterility. (See Addendum 3 attached for the international patent of this "immunosterilization vaccine".)

Fayrer-Hosken's invention has been successfully tested and found to be effective on all mammals, including the African elephant, although the potential long-term side effects are still being compiled. What exactly is the active ingredients of this sterilization vaccine? Primarily the sterilization vaccine contains antigens from PORCINE (pig) glyco-proteins (viruses are a form of glyco-proteins) bonded with a powerful oil-in-water "adjuvant" called squalene. (See addendum 3).

Is it just a coincidence that Novartis' master patent for the "swine flu" vaccine utilizes swine (porcine) glycol-proteins bonded with a powerful oil-in-water "adjuvant" called squalene?

Is it just a coincidence that Novartis' "swine flu" vaccine product information circular, section 8.1, includes this warning paragraph: "Animal reproduction studies have not been conducted with this – [vaccine]. It is also not known whether the vaccine can cause fetal harm when administered to a pregnant woman, or can Affect Reproduction Capacity." (Emphasis added.)

It would also seem highly logical that a sterilization vaccine disguised as a pandemic influenza vaccine would require a complete blanket shield against liability lawsuits and litigation as well - for such claims would undoubtedly number in the hundreds of millions. (Oops, sorry the vaccine made you sterile Mrs. Jones - we had absolutely no idea, you see!) Of course, such blanket immunity from lawsuits is exactly what has been given to the "swine flu" vaccine manufacturers and promoters by our corrupt federal government.

It is clear that the "swine flu" pandemic is no more serious than the common cold - but it is also increasingly clear that the VACCINE is the real danger. If the squalene adjuvant cripples and even kills the victim in addition to making him/her permanently stable, then I am confident that is perfectly ok with George Soros and his breed. Make no mistake, however, the entire agenda behind this pandemic vaccine hype is very likely the covert "immunosterilization" of the human herd!

- True Ott, PhD, ND

Addendum #1

Billionaire Club Meets to Curb Population Growth. The Sunday Times, Los Angeles, 24 May 2009, 1:05 a.m.
https://www.thetimes.co.uk/article/billionaire-club-in-bid-to-curb-overpopulation-d2fl22qhl02
https://web.archive.org/web/20170331035405/https://www.thetimes.co.uk/article/billionaire-club-in-bid-to-curb-overpopulation-d2fl22qhl02

America's richest people meet to discuss ways of tackling a 'disastrous' environmental, social and industrial threat
Some of America's leading billionaires have met secretly to consider how their wealth could be used to slow the growth of the world's population and speed up improvements in health and education.
The philanthropists who attended a summit convened on the initiative of Bill Gates, the Microsoft co-founder, discussed joining forces to overcome political and religious obstacles to change.

Described as the Good Club by one insider it included:
http://www.bibliotecapleyades.net/esp_sociopol_rockefeller.htm
David Rockefeller Jr, the patriarch of America's wealthiest dynasty
Warren Buffett and http://www.bibliotecapleyades.net/esp_sociopol_rothschild.htm
"George_Soros_and_The_Rothschild"George Soros, the financiers
Michael Bloomberg, the mayor of New York
http://www.bibliotecapleyades.net/esp_sociopol_mediacontrol.htm
media moguls Ted Turner and Oprah Winfrey

These members, along with Gates, have given away more than £45 billion since 1996 to causes ranging from health programs in developing countries to ghetto schools nearer to home.

They gathered at the home of Sir Paul Nurse, a British Nobel prize biochemist and president of the private Rockefeller University, in Manhattan on May 5. The informal afternoon session was so discreet that some of the billionaires' aides were told they were at "security briefings".

Richard Gale and Gary Null

Vaccines' Dark Inferno: What is not on insert labels?

Progressive Radio Network // OEN, 28/29 September 2009
https://www.opednews.com/Diary/Vaccines-Dark-Inferno-Wh-by-Richard-Gale-090929-440.htm

The vast majority of scientists, physicians, nurses, and public health educators trust that the ingredients in a vaccine have been individually and synergistically proven safe and effective. The public believes that these vaccines, aside from their specified virus(es), are sterile solutions, free from undesirable contaminants not listed on the manufacturers' package inserts. When the pediatrician injects a vaccine into the muscle of a child, the parents' unquestioning faith is that this is the case. In other words, we want to believe that vaccines have been generated under perfect conditions for the safety of children and ourselves.

Our investigation shows that most people do not know what is actually in a vaccine: the active ingredients listed on product labels, the inert ingredients, and, most important, the hidden ingredients. Even more remote is taking the time to actually study the subject matter, review the scientific literature, and discover the truth for oneself. To our amazement, that truth was easy to find. But it is a truth that will scare the hell out of you.

Imagine sitting down to eat veal parmigiana, and a video is placed on your table and used as a living reality recipe instead of the actual meal. This video displays every step in the calf's life, from its birth to the parmigiana on your plate. You witness how the little creature was starved of its natural nutrients, kept in a tiny stall, grossly malnourished and deformed, filled with antibiotics, diseased and suffering complete privation until finally slaughtered, cooked, and served on your plate. Would your appetite be the same? Would you still desire the parmigiana?

Conveniently, we rarely ask, where does our food come from? How and where was it grown? What was sprayed on it prior to our consumption? Thus we are going to re-record something that even most top health educators and opinion leaders on vaccines are unaware of: what goes into the making of vaccines, and what is hidden from you that should give you pause? Afterward, ask yourself: do you want vaccines in your body?

For the most in-depth, honest, scholarly, and objective examination of the methods by which vaccines and their hidden ingredients are prepared, we turn to award-winning British investigative medical journalist Janine Roberts, who paints an entirely different picture of the darker inferno in vaccines that does not appear on product labels. This is the same Janine Roberts who brought to the world's attention blood diamonds, genocide in the Congo, and the destruction of aboriginal cultures by the Australian government.

Roberts's account of conversations between high-level members from the World Health Organization (WHO), federal health agencies, and expert vaccine scientists who determine whether a certain vaccine will be approved, is horrid. Her investigations are based on official meeting documents and her attendance at emergency vaccine meetings, and confirm that our world's vaccine and health experts agree that there is no solution in sight to resolve the potential threats posed by these hidden ingredients.[1]

The story begins with the vaccine industrial complex's attempt to reduce manufacturing costs by seeking government approval to use cancerous cell lines in the development of vaccines. The industry's rationale is that cancerous cells are "immortal." Current vaccine methodology relies on animal cells, such as fertilized hen embryos and monkey kidneys, that die quickly in culture. Using cancerous cell lines is also much cheaper than relying on the purchase of animals, especially monkeys, that need to be sacrificed for vaccine substrates.

Roberts records two separate meetings – a meeting of the Vaccine and Related Biological Products Advisory Committee on November 9, 1998, and a subsequent gathering of the Evolving Scientific and Regulatory Perspective Workshop less than a year later. The conversations were conducted at a scientific level between top officials and expert scientists from the FDA, Center for Biologics Evaluation and Research (CBER), the National Institute of Allergies and Infectious Diseases (NIAID), the WHO, and others, each providing evidence and/or confirmation that all vaccines are dangerously contaminated.

Conversations focused primarily on the influenza, MMR, and yellow fever vaccines, which rely on fertilized chicken eggs for their culturing viruses. Fertilized chicken eggs, while ideally suited for culturing certain viruses for vaccines, such as the influenza and MMR vaccines, are also living incubators for large numbers of known and unknown viruses in the animal kingdom. While these do not transmit from their animal host to humans naturally, they nevertheless are sequential genetic codes that, when injected into the human body, have the potential for any number of unpredictable adverse effects by interfering or merging with the codes of human cells.

Vaccine research is at best a primitive science, because it involves injecting into the bloodstream foreign substances, chemical and genetic, that would not otherwise naturally enter the body. When we bring into the equation the enormous amount of known and unknown genetic material and foreign proteins that vaccines introduce into the body, and then consider the rapid increase in epidemics raging through the American population – adult diabetes in children, large numbers of various inflammatory and immune deficiency diseases, asthma and new allergies, severe gastrointestinal disorders (e.g., leaky gut syndrome and Crohn's disease), chronic fatigue syndrome, and many different neurological disorders (e.g., autism, ADD and ADHD, Parkinson's, Alzheimer's) – we must step back and reconsider their causes. We should avoid the kind of faith that the vaccine industrial complex has in its determinist, reductionist perspective of genetic materialism to find these answers without taking into account the bombardment of toxic chemicals such as vaccine adjuvants and preservatives, extraneous genetic material, pathogenic organisms, and foreign genetic fragments that assault our bodies from shortly after birth into old age.

For some time, it was known that the enzyme reverse transcriptase (RT) was present in final vaccine solutions. RT has been used to this day as an indicator that there is a presence of a retrovirus. During the meeting's proceedings, the WHO decided to withhold public announcement of such genetic contamination, in this case concerning the MMR vaccine; not to remove it from the market; and, in the meantime, continue safety studies at various laboratories.

Roberts reports that Dr. Arifa Khan from the FDA confirmed:

The RT activity in the vaccine was associated with retrovirus particles from two separate viral strains: Avian Leuokosis Virus (ALV) and Equine Arteritis Virus (EAV). The former was especially disturbing because ALV is a leukemia cancer, and Dr. Khan stated: "There was a theoretical possibility that the virus [ALV] could … infect the [human] cell." In summary, this means the ALV genetic code could integrate with human DNA, hence causing some kind of cancer.

The FDA's reassurance that the ALV RT activity was safe is based on laboratory observations that there was no viral–human DNA merger activity for "a full 48 hours." This kind of assurance is almost nonsensical and flies in the face of scientific reasoning, since cancers can take years to develop!

As a side note, RT activity is one of the stalwarts of the HIV/AIDS hypothesis. An article, "Influenza & Nursing Home Deaths" published by Canada's Vaccine Risk Awareness Network,

reports that some studies, and even some vaccine package inserts, "indicate that vaccinations increase HIV viral replication".[2] This means that all vaccines stimulate a strong suppressive effect on the immune system. Under stress conditions, viruses turn hyperactive and increase their ability to replicate.

The other risk stated by the FDA official was the possibility of the ALV sequence's merging with the measles virus, hence creating a completely new, mutant, and dangerous virus. (This could also apply equally to the H1N1 swine flu and any other flu vaccines). As an aside, the world-renowned British geneticist Dr. Mae-Wan Ho from the Institute of Science in Society wrote: "Vaccines themselves can be dangerous, especially live, attenuated viral vaccines or the new recombinant nucleic acid vaccines, they have the potential to generate virulent viruses by recombination and the recombinant nucleic acids could cause autoimmune disease".[3]

During the meeting, Dr. Andrew Lewis, then head of the DNA Virus Laboratory in the Division of Viral Products, confirmed: "All the egg-based vaccines are contaminated. … These fertilized chicken eggs are susceptible to a wide variety of viruses." The participants also realized that only a very small fraction of these small contaminants have been identified and there are likely hundreds more to be discovered.

Roberts found a 2001 CDC report showing that RT investigative studies for both the ALV and EAV retroviruses were conducted in 100 patients receiving the MMR vaccine. They found undesirable "RT activity in all measles vaccine lots from different manufacturers tested." Their conclusion is that "this occurrence is not sporadic and that vaccine recipients may be universally exposed to these [chicken] retroviral particles." In a separate National Institutes of Health transcript of a meeting, Dr. Conroy of the World Health Organization stated that EAV viruses are found in all fertilized chicken eggs. There appears to be little change in the scientific protocol for making the influenza, MMR, and yellow fever vaccines. The current release of intramuscular H1N1 vaccines for the global market relies on the use of fertilized chicken embryos. This includes each of the approved vaccines by CSL, Medimmune, Novartis, and Sanofi-Pasteur, as well as GlaxoSmithKline's, if and when it is approved in the US.

A later meeting of the FDA's Scientific and Regulatory Perspective Workshop, without the press, was convened on September 7, 1999, in Washington, DC, and attended by "representatives from all the largest public health institutions in the West." The following are summaries of key points and statements raised during this meeting as recorded in Janine Roberts's invaluable book Fear of the Invisible.

It was reconfirmed that vaccines are "widely contaminated by viral and DNA genetic code fragments, many viruses and proteins." There was expressed concern that these may also contain prions (tiny proteins responsible for incurable diseases and neurological disorders in both humans and animals) and oncogenes (a gene that turns normal cells into cancerous ones). One attendee, Dr. Goldberg, stated, "There are countless thousands of undiscovered viruses, proteins and similar particles. We have only identified a very small part of the microbial world – and we can only test for those we have identified. Thus the vaccine cultures could contain many unknown particles."

Dr. Andrew Lewis of the FDA said that a brand-new monkey-human mutant virus was created during the course of developing an adenovirus vaccine with adenvovirus-SV40 hybrid viruses. Dr. Lewis also worried that "foreign cellular DNA" common in childhood vaccines could include "viral oncogenes" capable of causing cancer.

The scientists presented a question to themselves as to whether an attenuated vaccine strain could revert into a variant virus capable of replicating so fast that it would cause AIDS. They agreed that they were unable to answer this question.

On the question of whether mutation events could occur in children after vaccination, the answer was: "Recombination among a variety of viruses [contaminant viruses] and cells co-infected in tissue culture is not uncommon." What this basically means is that because it is "not uncommon"

for genetic codes of both contaminant viruses and living cells to recombine and create mutations in laboratory cultures, this can certainly occur in a child's body after vaccination.

Dr. Hana Golding, chief of CBER's Laboratory of Retrovirus Research, raised the fear that although DNA fragment contaminants in vaccines may be thought dead, they could remain active and dangerous. This meant that the codes of these contaminants could combine in vaccines and create new mutant strains of pathogens.

Dr. Leonard Hayflick, a virologist at both Stanford and the University of California, San Francisco, raised a concern that the common primary culture used for making vaccines with animals and bird embryos has created a situation where it is "apparent that these cells contained many unwanted viruses, some of which were lethal to humans." This was especially worrisome of those vaccines, such as polio, which still rely on monkey kidney cells that have contributed to widespread death and illness.

One of the UK's leading vaccine experts, Dr. Phil Minor from the National Institute of Biological Standards and Control, noted that some cases of polio vaccine are polluted with more monkey virus, SV40, than actual poliovirus. Although the uninitiated who are not informed about closed-door vaccine science have been led to assume that SV40 was no longer in polio vaccines at the time of this meeting, the conversations confirmed that it was still in use. This is another example of conspiracy at high levels among the vaccine industrial complex and government health officials to withhold information that directly affects the citzens' well-being.

Dr. Rebecca Sheets, from the CBER's laboratory responsible for monitoring vaccine safety, stated that the national health organi-zations had no control over how vaccines were made. In short, they could make recommenda-tions, but the vaccine industrial complex was free to act as it chooses.

It is impossible to remove DNA contaminants from vaccines. Although weight limits for contaminating DNA were set by the FDA as far back as 1986, vaccine makers have never been able to reach that goal. The CDC decided to limit its weight recommendation to cancerous cell lines and then increase the other DNA contamination allowance 100-fold. However, these limits are only "recommendations," and therefore the FDA cannot enforce them. Vaccine manufacturers are still free to choose whether to take scientific measures to reduce contaminants.

Remember, this contamination limit (10 nanograms) only applies to a single vaccine. Children today are inoculated with many vaccines before entering school, each with unique DNA and viral contaminants due to the specific cell substrates used for a given vaccine. This toxic genetic soup is what then flows through a vaccinated person's body.

One government health official stated: "I chaired the committee that licensed the chickenpox vaccine, and it [residual DNA] was actually an issue that we considered at that time. We looked among recipients of the vaccine for evidence of an autoimmune response associated with the DNA included in that vaccine. … Actually, we didn't look, we asked the company to look and they did not find one." Well, of course, only such assurances can be convincing if in fact the company conducted the study, for which there was no compulsory reason to. Clearly, what the official is saying is that health authorities may not possess any documents that such a study actually exists.

Can vaccine DNA contamination cause cancer or autoimmune disease? A meeting participant responded: "When you consider that almost every one of these vaccines is injected right into the tissue … I think you couldn't do much more to get the DNA expressed [to get contaminating DNA taken up by human cells] than to inject it into a muscle in the way it's being done."

Again, CBER's Dr. Sheets: "I think that the vast majority of licensed vaccines, US licensed vaccines, have not been tested for residual DNA."

A more frightening question was raised as to whether there has been any presence of foamy virus. Foamy virus (HFV in human form and its more widespread parent SFV from monkeys), although not infectious, is a deadly carcinogen. To the participants' knowledge, no laboratory has ever searched for it in vaccine preparations.

The meeting confirmed that a particular cell, "which under many conditions is neoplastic [tumor causing]," has been licensed for the production of both injectible and oral polio vaccines in the US, Thailand, Belgium, and France. Therefore, these vaccines carry the high risk of containing cancer-causing oncogenes.

To appreciate the magnitude of the contamination problem in vaccine products, it is important to understand that vaccine filtration needs to allow the targeted virus's passage to remain for vaccine use. Other particles and pathogens smaller than the virus – DNA and RNA fragments from other organisms (and pathogens) in the manufacturing process, cellular substrates, and viral proteins – will remain in the vaccine.

What the content of these meetings tells us is best expressed by what leading attendee Dr. Minor stated: "So even today then you have to bear in mind that a large amount of vaccine that's made is made on really quite crude materials, from an adventitious agent point of view. It's not a trivial usage. In fact, when considering what vaccines are actually made on these days, they are quite primitive in some respects."

Janine Roberts summarizes her investigations succinctly:

In other words, the vaccines we give our children are liquids filled with a host of unknown particles, most of which came from the cells of non-humans: from chickens, monkeys and even from cancer cells. Truly we do not know what we are doing or what are the long-term consequences. All that is known for sure is that vaccines are a very cheap form of public medicine often provided by governments to assure the public that they really do care for the safety of our children.

The conclusion that can be drawn from these meetings is that vaccines are virtually genetic experiments, capable of causing mass cellular destruction, being injected into the world's population, especially children. There remain so many un-answered questions about vaccine science. This includes the forthcoming swine flu vaccines that will include the contaminants mentioned above, if we take any of these meeting attendees' words to heart.

If we are to express any awe and wonder, it should be towards the body's natural immune system and its ability to defend itself from the onslaught of vaccine brews. It is not vaccination that is a miracle of science, as the vaccine industrial complex, government health authorities, and their congregations of believers are too eager to proclaim. The real miracle is the body's ability to protect itself, in most cases, from the invasion of vaccines. Yet even this statement is now turning suspect, given the dramatic rise in multiple illnesses and inflammatory conditions across the age spectrum.

In any living system, whether it be a natural habitat in the wild, the planet's climate system to support life, or the body's immune system, a tipping point is eventually reached. Today, with the majority of the public still buying into the false promises of vaccinations' efficacy and safety, the vaccine industrial complex remains an extraordinarily lucrative business. More and more vaccines are now being developed for a wide variety of diseases and infections – Chlamydia, herpes simplex type 2, West Nile virus, Epstein-Barr virus, and others – that will only add to the overload of those already recommended, especially to children, who are officially recommended to receive 36 separate vaccinations by the time they reach 18 months of age. As these new genetic poisons are added to the national health agencies' recommended vaccination schedule, a tipping point may be reached that will result in a more serious pandemic – a pandemic of Vaccine Disease, manifesting in myriad illnesses dependent upon each vaccinated person's genetic predisposition and the robustness of the immune system – than any epidemic threat posed by wild infectious pathogens, including the H1N1 swine flu, that could unfold in our so-called developed, hygienic society.

Ineffectiveness and Dangers of Flu Shots

The People Voice, 5 October 2009
http://www.thepeoplesvoice.org/TPV3/Voices.php/2009/10/05/ineffectiveness-and-dangers-of-flu-shots

Believing what governments say can be hazardous to your health. It's even truer from corporate-sponsored studies on the benefits of their products. Thus, be very leery about the new CSL Ltd. one on the effectiveness of taking one Swine Flu dose. More to the point, any Swine Flu shot as, in single or multiple doses, they're all extremely toxic, dangerous, and must be avoided to protect human health from the pathogenic onslaught vaccines are designed to unleash.

CSL is "Australia's leading biopharmaceutical company (and) the only commercial manufacturer of influenza vaccines in the Southern Hemisphere." It's currently producing "a pandemic influenza vaccine called Panvax H1N1 which uses the proven technology that has enabled us to provide Australia with seasonal flu vaccines over the last 40 years."

The New England Journal of Medicine published "the welcome news," claiming to show one shot produced the same immune response protection as annual flu vaccines. More on their ineffectiveness and hidden dangers below.

The National Institute of Allergy and Infectious Diseases (part of the US National Institutes of Health) also claims its early trials and studies confirm one dose provides protection eight to ten days after inoculation. Again beware - their advice endangers your health, especially about Swine Flu and the vaccines designed for it. They advise everyone take them voluntarily. Later, Health and Human Services (HHS) Secretary Kathleen Sebelius may mandate them if enough people don't comply, and individual states may follow suit.

Separating Facts from Government and Industry Disinformation

According to the Centers for Disease Control (CDC), annual flu shots are advised for "all children from 6 months through 18 years of age," everyone over 50, pregnant women, and individuals with "long-term health problems" like heart, lung, kidney or liver disease, HIV/AIDS, other immune system diseases or persons with weakened immune systems, asthma, diabetes, anemia, certain muscle or nerve disorders, residents of nursing homes or chronic care facilities, and certain others.

Warning about "seasonal epidemics," the World Health Organization's (WHO) advice is much the same, adding that "Seasonal influenza spreads easily and can sweep through schools, nursing homes or businesses and towns....The most effective way to prevent the disease or severe outcomes from the illness is vaccination."

The WHO claims "Among healthy adults, influenza vaccine can prevent 70% to 90% of influenza-specific illness. Among the elderly, the vaccine reduces severe illnesses and complications by up to 60%, and deaths by 80%."

Information below shows WHO claims are false and misleading. So are the CDC's and NIH's and doubly so for the new Swine Flu vaccines.

All Vaccines Are Ineffective and Unsafe

Gary Null is a leading health and nutrition expert, author, documentary filmmaker, founder of the Progressive Radio Network, and syndicated host of the longest running health program in America, Natural Living with Gary Null.

On September 18, 2009, he interviewed Dr. Viera Scheibner, "arguably one of the world's most respected scientists and scholars on vaccine medical data....Her investigations uncover how the vaccine industrial complex (and complicit government regulatory bodies produce) pseudo-science that is fraught with inconsistencies, poorly designed studies, erroneous interpretations, and conclusions that are patently false" - by design, not chance.

She calls vaccinations "an illness industry," causing a "pandemic (of) degenerative diseases (and) behavioral problems."

From her research and writings on vaccine science and history, she said:

"Ever since the turn of the (last) century, medical journals published dozens and dozens of articles demonstrating that injecting vaccines (can) cause anaphylaxis, meaning harmful, inappropriate immunological responses, which is also called sensitization. (This) increase(s) susceptibility to the disease which the vaccine is supposed to prevent, and to a host of related and other unrelated infections."

"We see it in vaccinated children within days, within two or three weeks. (Most of them) develop runny noses, ear infections, pneumonitis, (and) bronchiolitis. It is only a matter of degrees, which indicates immuno-suppression, (not immunity). It indicates the opposite. So I never use the word immunization because that is false advertising. It implies that vaccines immunize, which they don't. The correct term is either vaccination or sensitization."

In addition, "Vaccines (can) damage internal organs, particularly the pancreas," so everyone vaccinated, including for seasonal flu, is vulnerable to contracting severe "autoimmune diseases like diabetes," Addison's Disease, Arthritis, Asthma, Guillian-Barre Syndrome, Hepatitis, Lou Gehrig's Disease, Lupus, Multiple Sclerosis, Osteoporosis, Polio, and dozens of others.

Some can kill. Others produce a lifetime of disability and pain because autoimmune disease happens when the "body attacks itself," or more accurately "is attacked" by an unhealthy lifestyle, stress, and various harmful ingestible substances; that is, toxins in drugs, food, air, water, and other liquids. According to immunologist, Dr. Jesse Stoff, human health is compromised four ways:

- by poor nutrition;
- man-made environmental toxins;
- disease-causing organisms and their toxins; and
- immune system trauma from factors like x-ray radiation and stress.

Other factors include a lack of sleep and exercise, smoking, heavy alcohol consumption, and various excesses that throw the body out of balance, making it susceptible to a host of debilitating illnesses.

Known Toxins in Seasonal Flu and Other Vaccines

Millions voluntarily take annual flu shots not knowing their harmful ingredients. With variations by producer, they contain numerous stabilizers, neutralizers, carrying agents, and preservatives, including:

- 25 micrograms of mercury (thimerosal), a known neurotoxin; one microgram is considered toxic; according to the NIH, "mercury and all of its compounds are toxic, exposure to excessive levels can permanently damage or fatally injure the brain and kidneys;" even "exposures to very small amounts" can also cause "allergic reactions, neurological damage and death;" it's also linked to autism;
- aluminum hydroxide and phosphate, known to be linked to some neurodegenerative diseases, including Alzheimer's disease; the Office of Occupational Safety and Health Administration (OSHA) reports x-ray evidence of pulmonary fibrosis among workers studied; it also reports that patients undergoing long-term kidney dialysis develop speech disorders, dementia, or convulsions;
- formaldehyde, a known carcinogen according to the National Cancer Institute; it's also linked to upper respiratory tract problems and effects on lymphatic and hematopoietic systems (relating to human blood cells);
- gelatin, polysorbate 80 and resin - ingredients causing severe allergic reactions;
- ammonium sulfate, a suspected gastrointestinal, liver, and respiratory toxicant and neurotoxicant;
- sorbitol, a suspected gastrointestinal and liver toxicant;
- phenoxyethanol (antifreeze), a suspected developmental and reproductive toxicant;
- beta-propiolactone, a known carcinogen and suspected gastrointestinal, liver, respiratory, skin and sense organ
- gentamycin, an antibiotic;
- triton X100, a strong detergent;
- animal tissues and fluids, including potentially contaminated horse blood, rabbit brain, dog kidney, monkey kidney, chick embryo, chicken egg, duck egg, pig blood, and porcine (pig) protein/tissue;
- calf and fetal bovine serum;
- macerated cancer cells;
- diploid cells from aborted fetal tissue; and/or other ingredients varying by producer.... etc.

Aiming Towards Better Health

Are Populations Being Primed for Nano-Microchips Inside Vaccines?

Prevent Disease, 5 October 2009
https://web.archive.org/web/20091227205102/http://preventdisease.com/news/09/100509_injectable_nano_microchips.shtml

It's almost surreal, like something out of a sci-fi flick, but nano-microchips invisible to the naked eye are a reality that are already being hosted in wide-range of applications. The question is, how long will it take governments and big pharma to immerse nano-microchips inside of vaccines to tag and surveil global populations?

Nanotechnology deals with structures smaller than one micrometer (less than 1/30th the width of a human hair), and involves developing materials or devices within that size. To put the size of a nanometer in perspective, it is 100,000 times smaller than the width of a human hair.

More than ten years ago, simple low-cost techniques improved the design and manufacture of nano-microchips. That unlocked a multitude of methodologies for their manufacture in a wide-range of applications including optical, biological, and electronic devices.

The joint use of nanoelectronics, photolithography, and new biomaterials, have enabled the required manufacturing technology towards nanorobots for common medical applications, such as surgical instrumentation, diagnosis and drug delivery.

Japan's Hitachi says it has developed the world's smallest and thinnest microchip, that can be embedded in paper to track down parcels or prove the authenticity of a document. The integrated circuit (IC) chip is as minute as a speck of dust.

Nanoelectrodes implanted in the brain are increasingly being used to manage neurological disorders. Mohammad Reza Abidian, a post-doctoral researcher at the U-M Department of Biomedical Engineering said that polymers in nanotubes "are biocompatible and have both electronic and ionic conductivity." He further stated "therefore, these materials are good candidates for biomedical applications such as neural interfaces, biosensors and drug delivery systems."

Depending on the objectives of such studies, research could theoretically pave the way for smart recording electrodes that can deliver drugs to positively or negatively affect the immune response.

Through nanotechnology, researchers have also been able to create artificial pores able to transmit nanoscale materials through membranes.

A UC biomedical engineering study appearing in the journal Nature Nanotechnology, Sept. 27, 2009, successfully inserted the modified core of a nanomotor, a microscopic biological machine, into a lipid membrane. The resulting channel enabled them to move both single- and double-stranded DNA through the membrane.

Professor Peixuan Guo who led the study said past work with biological channels has been focused on channels large enough to move only single-stranded genetic material.

"Since the genomic DNA of human, animals, plants, fungus and bacteria are double stranded, the development of single pore system that can sequence double-stranded DNA is very important," he says.

Such engineered channels could have applications in nano-sensing, DNA sequencing, drug loading, including innovative techniques to implement DNA packaging mechanisms of viral nanomotors and vaccine delivery.

"The idea that a DNA molecule travels through the nanopore, advancing nucleotide by nucleotide, could lead to the development of a single pore DNA sequencing apparatus, an area of strong national interest," Guo said.

Scientists working at Queen Mary, University of London, have developed micrometer-sized capsules to safely deliver drugs inside living cells. These "micro shuttles" could hypothetically be loaded with a specific microchip controlling the dose of medication to be opened remotely, releasing their contents. Besides monitoring the dosage, the same microchip could be used to surveil the patient in conjunction with various tracking systems.

Scientists in the United Kingdom have recently reported advances towards overcoming key challenges in nanotechnology. They demonstrated how nanoparticles could move quickly in a desired direction without help from outside forces. Their achievement has broad implications, the scientists say, raising the possibility of coaxing cells to move and grow in specific directions.

Doug Dorst, a microbiologist and vaccine critic in South Wales, says these advances have an immense appeal to vaccine makers. "Biotech companies and their researchers have quickly moved most funding initiatives towards nanotechnology to increase the potency of their vaccines," he said. If microorganisms inside of vaccines can be coaxed into targeting or invading specific cells, they could achieve their goal at an accelerated rate over conventional vaccines. "Depending on which side of the vaccine debate you're on, whether pro or con, nanobots inside vaccine preparations could advance their effectiveness exponentially by either dramatically improving or destroying immunity depending on their design," he added.

Dorst claims that present day nanobot technology could just as easily be used to advance biological weapons as they can to advance human health. "For every fear that biotech propaganda proliferates about deadly diseases and how vaccines prevent them, it is one more lie to incrementally convince the masses that vaccines are effective."

The worry for Dorst is that one day vaccines "will do what they've always been intended for...control of the global populace."

Nanoemulsion platforms are already capable of developing vaccines from very diverse materials. Mixtures of soybean oil, alcohol, water and detergents can be emulsified into ultra-small particles smaller than 400 nanometers wide (about 1/200th the width of a human hair). These could be combined with any number of nano-microchips with all or part of disease-causing microbes to trigger the body's immune system.

In 2007 researchers at the Ecole Polytechnique Fédérale de Lausanne (EPFL) announced in an article in the journal, Nature Biotechnology, that they had developed a "nanoparticle that can deliver vaccines more effectively, with fewer side effects, and at a fraction of the cost of current vaccine technologies." The article went on to describe the effects of their breakthrough: "At a mere 25 nanometers, these particles are so tiny that once injected, they flow through the skin's extracellular matrix, making a beeline to the lymph nodes. Within minutes, they've reached a concentration of DCs thousands of times greater than in the skin."

Russia has recently announced a new manufacturing plant that will strictly produce nano-vaccines. Project plans include development of two vaccines for human flu and bird flu and three biopharmaceuticals for boosting the immune system and increasing the efficiency of antibacterial and antiviral drugs, among other initiatives.

The human body is very resistant to nanoparticles that attempt to invade human cells. Scientists are intensely investigating methods to disrupt human enzymes that may degrade nanoparticles. Experts at the University of Liverpool found a way around this obstacle that could mean more efficient, topical drugs in the future, which could act a whole lot faster than the ones currently in use.

All these nanotechnological advances raise many issues and concerns about the toxicity and environmental impact of nanomaterials, and their potential effects on medicine, global economics, as well as speculation about government surveillance. These concerns have led to a debate among advocacy groups and governments on whether special regulation of nanotechnology is warranted.

The Environmental Protection Agency issued a news release last week saying that it had "today outlined a new research strategy to better understand how manufactured nanomaterials may harm human health and the environment." Interesting as that strategy document is, it was hardly hot off the presses.

Indeed, many companies advertise their use of such billionth-of-a-meter-scale constituents as a measure of a product's state-of-the-art status, implying that ultra-small ingredients are an inherently good thing. They aren't. Nor does size necessarily make these materials worse than others. At this point it's just maddeningly unpredictable what nano things will do.

Proponents of nanotechnology are very critical of regulatory measures that may impeed its progression. Many of these critics have staunchly dismissed concerns as being fear-hyped conspiracy theories based on science fiction.

In the popular video game series Metal Gear Solid, many characters and soldiers in general, have "nano-machines" in their bloodstream, and are used to block pain, allow members of fire teams/patrols to share sensory information, heal bodily damage, as well as manipulating viruses central to video game's plot line.

Through the use of special effects and computer-generated imagery, several blockbusters starring Keanu Reeves including The Matrix Trilogy and The Day the Earth Stood Still, have dramatized how nanobots could effectively take control of their organic and inorganic targets.

Star Trek episodes and their theatrical releases such as Star Trek: First Contact have also depicted how nanoprobes (nanites) could infect an individual's bloodstream through a pair of tubules.

Regardless of the recurring themes of nanobots in video games, sci-fi shows and movies, nanotechnology is a reality, and nano-microchips are well on their way to being utilized in ways which may be detrimental to human health and freedom on a global scale.

The development of nano-microchips are a major thrust of governments and pharmaceutical industries who want the ultimate power and leverage over global populations for more profit and more control.

In December 2000, Former Chief Medical Officer of Finland, Rauni-Leena Luukanen-Kilde, MD stated that it is technically possible for every newborn to be injected with a microchip, which could then function to identify the person for the rest of his or her life. Such plans are secretly being discussed in the U.S. without any public airing of the privacy issues involved.

Today's microchips operate by means of low-frequency radio waves that target them. With the help of satellites, the implanted person can be tracked anywhere on the globe. Such a technique was among a number tested in the Iraq war, according to Dr. Carl Sanders, who invented the intelligence-manned interface (IMI) biotic, which is injected into people. (Earlier during the Vietnam War, soldiers were injected with the Rambo chip, designed to increase adrenaline flow into the bloodstream.) The 20-billion-bit/second supercomputers at the U.S. National Security Agency (NSA) could now "see and hear" what soldiers experience in the battlefield with a remote monitoring system (RMS).

When a 5-micromillimeter microchip (the diameter of a strand of hair is 50 micromillimeters) is placed into optical nerve of the eye, it draws neuroimpulses from the brain that embody the experiences, smells, sights, and voice of the implanted person. Once transferred and stored in a computer, these neuroimpulses can be projected back to the person’s brain via the microchip to be reexperienced. Using a RMS, a land-based computer operator can send electromagnetic messages (encoded as signals) to the nervous system, affecting the target's performance. With RMS, healthy persons can be induced to see hallucinations and to hear voices in their heads.

Every thought, reaction, hearing, and visual observation causes a certain neurological potential, spikes, and patterns in the brain and its electromagnetic fields, which can now be decoded into thoughts, pictures, and voices. Electromagnetic stimulation can therefore change a person's brainwaves and affect muscular activity, causing painful muscular cramps experienced as torture.

The NSA's electronic surveillance system can simultaneously follow and handle millions of people. Each of us has a unique bioelectrical resonance frequency in the brain, just as we have unique fingerprints. With electromagnetic frequency (EMF) brain stimulation fully coded, pulsating electromagnetic signals can be sent to the brain, causing the desired voice and visual effects to be experienced by the target. This is a form of electronic warfare. U.S. astronauts were implanted before they were sent into space so their thoughts could be followed and all their emotions could be registered 24 hours a day.

The mass media has not reported that an implanted person's privacy vanishes for the rest of his or her life. S/he can be manipulated in many ways. Using different frequencies, the secret controller of this equipment can even change a person's emotional life. S/he can be made aggressive or lethargic. Sexuality can be artificially influenced. Thought signals and subconscious thinking can be read, dreams affected and even induced, all without the knowledge or consent of the implanted person.

This secret technology has been used by military forces in certain NATO countries since the 1980s without civilian and academic populations having heard anything about it. Thus, little information about such invasive mind-control systems is available in professional and academic journals.

The NSA's Signals Intelligence group can remotely monitor information from human brains by decoding the evoked potentials (3.50HZ, 5 milliwatt) emitted by the brain. Prisoner experimentees in both Gothenburg, Sweden and Vienna, Austria have been found to have evident brain lesions. Diminished blood circulation and lack of oxygen in the right temporal frontal lobes result where brain implants are usually operative. A Finnish experimentee experienced brain atrophy and intermittent attacks of unconsciousness due to lack of oxygen.

Targeting people's brain functions with electromagnetic fields and beams (from helicopters and airplanes, satellites, from parked vans, neighboring houses, telephone poles, electrical appliances, mobile phones, TV, radio, etc.) is part of the radiation problem that should be addressed by democratically elected governments. However, there is currently no interest by any national government to seriously address this issue.

The timeline for integrating nano-microchips inside of vaccines is speculative. It could be just a few years, months or perhaps it is here and we already unaware of their integration within pharmaceuticals. Regardless, due to the many military and political advantages, their implementation is inevitable.

However fraudulent, it was an imperative for world powers and pharmaceutical cartels to promote the effectiveness of vaccinations and enact national pandemic preparedness policies which mandate vaccinations.

In 2005 the World Health Organization (WHO) developed international health regulations that would bind all 194 member countries to pandemic emergency guidelines which could enforce such a mandate. Without these procedures of public health (and propagandized vaccine campaigns) in place, there would be little or no voluntary cooperation from the public to roll up their sleeves and accept the inoculations. Public participation is an essential tool that will soon allow big pharma to inject the most effective surveillence tool ever designed into billions of people.

Although nanotechnology manufacturing is currently available on a global scale, before biotech companies are able to initiate mass production and testing of nano-microchips inside of vaccines, they will likely sell the idea to the public. Through various "health enhancement scenarios" they will encourage participation and publicly announce regulatory approval from the same policies and regulatory agencies they helped create.

By mid-summer of 2009, the WHO and the Center of Disease Control (CDC) effectively hyped a false flu pandemic and convinced the world to submit to H1N1 vaccines. Additional doses of propaganda and possibly a biological event, may equally convince populations to knowingly accept microchips inside of vaccines under the guise of a "greater good" for humanity.

When our brain functions are already connected to supercomputers by means of radio implants and microchips, it will be too late for protest. This threat can be defeated only by educating the public, using available literature on biotelemetry, nanorobotics and information exchanged at international congresses.

The time to act is now!

FINANCIAL TIMES

William Easterly

Human rights are the wrong basis for healthcare

Financial Times, 13 October 2009
https://www.ft.com/content/89bbbda2-b763-11de-9812-00144feab49a

The agonising US healthcare debate has taken on a new moral tone. President Barack Obama recently held a conference call with religious leaders in which he called healthcare "a core ethical and moral obligation". Even Sarah Palin felt obliged to concede: "Each of us knows that we have an obligation to care for the old, the young and the sick."

This moral turn echoes an international debate about the "right to health". Yet the global campaign to equalise access to healthcare has had a surprising result: it has made global healthcare more unequal.

The notion of a "right to health" has its origins in the United Nations' Universal Declaration of Human Rights in 1948. But in the decades that followed, foreign aid's most successful efforts in health – such as the World Health Organisation and Unicef campaigns on vaccines and antibiotics – were based on a more limited goal: obtaining the largest possible health benefits for the poor from finite foreign aid budgets.

The moral argument made a big comeback in the new millennium. One of its most eloquent advocates is Dr Paul Farmer, who earned fame with heroic efforts to give people access even to complex medical treatment amid extreme poverty in Haiti and Rwanda, saying that healthcare was "a fundamental human right, which should be available free". The WHO shifted from pragmatic improvement of health outcomes towards "the universal realisation of the right to health". Even Amnesty International, advocate of traditional human rights such as freedom from torture, added a new section to its human rights report in 2009 on the "right to health".

So what is the problem? It is impossible for everyone immediately to attain the "highest attainable standard" of health (as the health rights declaration puts it). So which "rights to health" are realised is a political battle. Political reality is that such a "right" is a trump card to get more resources – and it is rarely the poor who play it most effectively.

The biggest victory of the "right to health" movement has been the provision of aid-financed antiretroviral treatment for African Aids patients, who include the upper and middle classes. Aids treatment got funding from, among many others, the Bush and Obama administrations, the Clinton Foundation, the Gates Foundation and the UN Millennium Development Goals campaign. The WHO 2004 report that emphasised the "right to health" did so on behalf of only one specific effort – Aids treatment.

Saving lives in this way is a great cause – except to the extent that it takes resources away from other diseases. Alas, many observers fear that is exactly what it did.

An evaluation by the World Bank in 2009 faulted the bank for allowing Aids treatment to drive out many other programmes. Global deaths due to either tuberculosis or malaria stood at 2m in 2008,

around the same as those from Aids. Yet Aids accounted for 57 per cent of World Bank projects on communicable diseases from 1997 to 2006, compared with 3 per cent for malaria and 2 per cent for TB. Other big killers of the poor – such as pneumonia, measles and diarrhoeal diseases, which together accounted for more than 5m deaths in 2008 – received even less attention.

Rights advocacy also favours some aspects of health relative to others. Those who are HIV-positive advocate effectively for their right to treatment, while those who will get Aids in the future cannot organise a lobby for a "right to prevention". The results can be seen in the 2009 report of the President's Emergency Plan for Aids Relief (Pepfar), one of the largest foreign aid programmes in American history. Only 22 per cent of its budget goes towards prevention, compared with 48 per cent towards treatment.

The lesson is that, while we can never be certain, the "right to health" may have cost more lives than it saved. The pragmatic approach – directing public resources to where they have the most health benefits for a given cost – historically achieved far more than the moral approach.

In the US and other rich countries, a "right to health" is a claim on funds that has no natural limit, since any of us could get healthier with more care. We should learn from the international experience that this "right" skews public resources towards the most politically effective advocates, who will seldom be the neediest.

THE FLU CASE

Jane Burgermeister

Are we being ruled by Satanists?

The Flu Case, 13 October 2009 19:41
https://web.archive.org/web/20091017030104/http://www.theflucase.com/index.php?option=com_content&view=article&id=1021:are-we-being-ruled-by-satanists-&catid=1:latest-news&Itemid=64&lang=en

I was listening to Infowars yesterday and Alex Jones talking to David Icke about Frederic Mitterrand, the French Culture Minister, and his admission, in his own autobiography that he raped young boys.

In spite of this hideous crime, Mitterand was selected to be the Culture Minister by the French Prime Minister Nicolas Sarkozy with an especial recommendation from his wife Carla Bruni.

Both have rallied to the defence of Frederic Mitterrand after he came under attack for standing up for Roman Polanski who was recently arrested in Switzerland for raping a drugged 13-year-old girl.

Mitterand is the nephew of former French Prime Minister Francois Mitterand who admitted he was a Satanist.

According to David Icke and Alex Jones, this paedophile rapist and their apologists in Paris is just the tip of the iceberg. Reports of bestial torture of women by the members of the Rothschild family in one of their cheateaus in France have emerged, ahd the Rockefellers, who founded the UN, and pushed through senate bill 666 to fund the development of bioweapons by pharma companies, helped install a St Lucy's (Lucifer's) chapel within the UN headquarters.

In addition, Marc Dutroux, the Belgian padeophile, testified at his trial that he supplied children for rape, ritual torture and murder to the highest social circles.

Evil has appeared to humanity in many shapes and sizes throughout history, personified as a populist, a blood-thirsty empire builder, a eugenicist, an insane monarch or a totalitarian dictator, or embodied in a political system such as Nazism, Facism, Communism, or as a metaphysical or demonic force that enters into our world from another dimension.

Although our society – shaped by people like Frederic Mitterrand -- has increasinly marginalised and trivialised evil, claiming it does not exist, is only a projection or a concept that some people employ in order to threaten and oppress others, our culture testifies to the widespread belief in the existence of evil.

Fairytales, myths, plays, films etc, video games are full of representations of the destructive force of evil on people’s lives.

While all the world's religions praise virtue, goodness and life, they also all without exception condemn cruelty, selfishness and destructiveness.

The ancient Greek philosophers Plato and Aristoteles held the view that virtue was not just a duty or the burden of conforming to rules imposed on us from outside but the path to true happiness. A part of virtuous life included fulfilling our own unique talents and life purpose. That's why the

ancient Greeks thought there could be no "standard" virtuous life: our talents are too different; our life purposes are too varied. We are all happy and virtuous in our own way.

Incidentally, the ancient Greeks also condemned peadophila, distinguishing clearly between emotional bonds of love between adults and children (agape) and physical bonds (eros). Contrary to the popular belief, the ancient Greeks were strongly opposed to any physical contact between adults and children, recognising the damage this does to children as well as to the adults and only encouraged emotional bonds between adults and children if these furthered children's talents and their development.

The Russian novelist Fyodor Doestoevsky also explored how the evil people do to others eventually destroys their capacity for happiness and even their own psyches by creating feelings of fear, depression and shame.

To escape the anguish of interior darkness, many people do not look at themselves in the mirror, make atonement to their victims and correct their actions. Instead, they tell themselves all kinds of lies and justifications and then seek new highs and new adrenaline rushes just like Frederic Mitterand raping young children for the „excitement" it gives him.

It is unacceptable in my view that we are being governed by a group of people, who are supporting each other in secret networks such as the freemason network – some of the highest-grade freemasons are invited to the Bilderberg conferences every year – and who practice and defend the bestial rape of children, and who, in addition, promote a toxic „swine flu" jab for pregnant women and children knowing full well that this poisonous jab will lead to the death of many of those women and children.

The ancient Greeks believed that virtue does not consist in saying "Amen, Amen" to every crime, in never rocking the boat and in finding excuses for every psychopath. In their eyes, virtue involved an active effort to do what was good - and to fight what is evil.

It is time for us to draw the line and say "No" to child rapists and the pushers of toxins no matter how much money or power they have or how many justifications.

Educate-Yourself

Wanted

for bio-terrorism, crimes against humanity, genocide and conspiracy to commit **Mass Murder**

Barack Obama, Dr Margaret Chan, & Dr Thomas R. Frieden

– Educate-Yourself, 25 October 2009
https://web.archive.org/web/20091031061756/http://educate-yourself.org/vcd/bioterrorismwantedposter25oct09.shtml

Editor's Note:
This is an extremely important article. It states that former Secret Service agent turned bioweapons "expert" Marc S Griswold, was ordered by Indonesian-Imposter-Posing-as-US-President Barack Obama, to transport a vial of the bio-weaponized H1N1 germs (from the Army's Fort Detrick, MD lab) aboard Air Force One when Obama (along with Marc Griswold and Energy Secretary Steven Chu) made an unscheduled trip to Mexico on April 16, 2009 for a "working dinner" with officials of the Mexican government. Upon Griswold's return to Texas on April 18, 2009, he (and later his family) began to experience the nation's first symptoms of "Swine flu" 'pandemic' ... Ken Adachi

De Facto US president Barack Hussein Obama, World Health Organization Head Dr. Margaret Chan and Centers for Disease Control and Prevention Director Dr. Thomas R. Frieden are all guilty of conspiring to commit and committing the following high crimes: bio-terrorism, crimes against humanity, genocide and conspiracy to commit mass murder.

Bioterrorism is terrorism by intentional release or dissemination of biological agents (bacteria, viruses, or toxins); these may be in a naturally-occurring or in a human-modified form.

According to the US-based Centers for Disease Control and Prevention (CDC): A bioterrorism attack is the deliberate release of viruses, bacteria, or other germs (agents) used to cause illness or death in people, animals, or plants. These agents are typically found in nature, but it is possible that they could be changed to increase their ability to cause disease, make them resistant to current medicines, or to increase their ability to be spread into the environment.

In 1975 the U.S. ratified both the 1925 Geneva Protocol and the 1972 Biological Weapons Convention (BWC) – international treaties outlawing biological warfare. Recent U.S. biodefense programs, however, have raised concerns that it may be pursuing research that is outlawed by the BWC. In recent years the U.S. stance on biological warfare and the use of biological agents has differed from historical interpretations of the BWC. For example, it is said that the U.S. now maintains that the Article I of the BWC (which explicitly bans bio-weapons), does not apply to "non-lethal" biological agents. Previous interpretation was stated to be in line with a definition laid out in Public Law 101-298, the Biological Weapons Anti-Terrorism Act of 1989. That law defined a biological agent as:

.."any micro-organism, virus, infectious substance, or biological product that may be engineered as a result of biotechnology, or any naturally occurring or bioengineered component of any such microorganism, virus, infectious substance, or biological product, capable of causing death, disease, or other biological malfunction in a human, an animal, a plant, or another living organism; deterioration of food, water, equipment, supplies, or material of any kind..."

According to the Federation of American Scientists, U.S. work on non-lethal agents exceeds limitations in the BWC. When the U.S. BW program ended in 1969 it had developed seven mass-produced, battle-ready biological weapons in the form of agents that cause: anthrax, tularemia, brucellosis, Q-fever, VEE, and botulism. In addition Staphylococcal Enterotoxin B was produced as an incapacitating agent.

In addition to the agents that were ready to be used the U.S. program conducted research into the weaponization of more than 20 other agents. They included: smallpox, EEE and WEE, AHF, Hantavirus, BHF, Lassa fever, glanders, melioidosis, plague, yellow fever, psittacosis, typhus, dengue fever, Rift Valley fever (RVF), CHIKV, late blight of potato, rinderpest, Newcastle disease, bird flu, and the toxin ricin.

Under the Bush administration the U.S. Army replaced its Military Institute of Infectious Diseases at Fort Detrick, Md., "with a new laboratory that would be a component of a biodefense campus operated by several agencies." The

Army told the Associate Press that the laboratory is intended to continue research that is only meant for *defense* against biological threats.

But University of Illinois **international law professor Francis Boyle** charged the Fort Detrick work would include "acquiring, growing, modifying, storing, packaging and dispersing classical, emerging and genetically engineered pathogens." Those activities, as well as planned study of the properties of pathogens when weaponized, "are unmistakable hallmarks of an **offensive weapons program**."

Boyle made his comments to Fort Detrick as part of its environmental impact assessment of the new facility. Boyle pointed out in his letter that he authored the 1989 U.S. law enacted by Congress that criminalized BWC violations.

The Fort Detrick expansion is but one phase of a multi-billion biotech buildup going forward in 11 agencies sparked by the Oct., 2001, anthrax attacks on Congress that claimed five lives and sickened 17.

The attacks, and ensuing panic, led to passage of the **BioShield Act of 2004**. Evidence stated that the attacks were not perpetrated by any foreign government or terrorist band but originated at Fort Detrick, the huge, supposedly super-safe biotechnology research center. After an intensive FBI investigation, one person was charged with the crime but never went to trial because the Anthrax suspect at Fort Detrick commited suicide.

Referring to the work undertaken at Fort Detrick, **Mark Wheelis**, Senior Lecturer in the Section of Microbiology of the University of California, Davis, told the Global Security Newswire (GNS) as far back as June 30, 2004,

"This is absolutely without any question what one would do to develop an offensive biological weapons capability."

"We're going to develop new pathogens for various purposes. We're going to develop new ways of packaging them, new ways of disseminating them. We're going to harden them to environmental degradation. We'll be prepared to go offensive at the drop of a hat if we so desire," ... he told the Global Security Newswire.

Alan Pearson, director of the chemical and bioweapons control program at the Center for Arms Control and Nonproliferation Studies in Washington, told the Baltimore Sun government scientists must tread carefully lest they wind up "in essence creating new threats that we're going to have to defend ourselves against."

Richard Novick, a New York University microbiology professor has stated, "I cannot envision any imaginable justification for changing the antigenicity of anthrax as a defensive measure." (That is, to create a new strain for which there is no known cure. - The WHO has declared that the H1N1 virus is a new strain for which there is no known cure.)

Milton Leitenberg, a University of Maryland arms control advocate, told The Washington Post last July 30th, "If we saw others doing this kind of research (Fort Detrick), we would view it as an infringement of the bioweapons treaty. You can't go around the world yelling about Iranian and North Korean programs, about which we know very little, when we've got all this going on."

One alarming example of such Federally-funded research reported in the October, 2003, issue of "New Scientist," is the creation of "an extremely deadly form of mousepox, a relative of the smallpox virus, through genetic engineering." The publication warned such research "brings closer the prospect of pox viruses that cause only mild infections in humans being turned into diseases lethal even to people who have been vaccinated."

Edward Hammond, director of The Sunshine Project of Austin, Tex., a non-profit working for transparency in biological research, said the recreation of the deadly 1918 "Spanish flu" germ that killed an estimated 40-million world-wide, means "the possibility of man-made disaster, either accidental or deliberate, has risen for the entire world." The H1N1 virus has been repeatedly compared to the 1918 Spanish flu. That would mean that the H1N1 virus outbreak is the man-made disaster that Edward Hammond warned of.

Richard H. Ebright, a Rutgers University chemist who tracks arms control issues, told The Baltimore Sun the government's tenfold expansion of Biosafety Level-4 laboratories, such as those at Fort Detrick, raises the risk of accidents or the diversion of dangerous organisms. "If a worker in one of these facilities removes a single viral particle or a single cell, which cannot be detected or prevented, that single particle or cell can form the basis of an outbreak," he said. On April 23, 2009 CNN published a story concerning missing vials of a potentially dangerous virus that prompted an Army investigation into the disappearance from a biological weapons research lab in Maryland. The Army's Criminal Investigation Command agents were sent to Fort Detrick in Frederick, Maryland, to investigate the disappearance of the vials. The vials contained samples of Venezuelan Equine Encephalitis, a virus that sickens horses and can be spread to humans by mosquitoes (a vaccine uses a syringe that functions like a mosquito in that it draws blood). In 97 percent of cases, humans with the virus suffer flu-like symptoms, but it can be deadly in about 1 out of 100 cases, according to Caree Vander Linden, a spokeswoman for the Army's Medical Research Institute of Infectious Diseases.

The expansion at Fort Detrick flows from a paper penned by President Bush. His Homeland Security Presidential Directive, HSPD-10, written April 28, 2004, states,

"A*mong our many initiatives we are continuing to develop more forward-looking analyses, to include Red Teaming efforts, to understand new scientific trends that may be exploited by our adversaries* to develop biological weapons a*nd to help position intelligence collectors ahead of the problem."*

Boyle said the Bush paper is "a smoking gun" fired at the BWC. "Red Teaming means that we actually have people out there on a Red Team plotting, planning, scheming and conspiring how to use biowarfare."

On April 16, 2009 Barack Hussein Obama did wilfully and intentionally release a biological agent, the swine flu virus. The day after the nation wide Tax Day Tea Party Revolt (Disgruntled American taxpayers fed up with higher taxes and government spending convened in protest at hundreds of locations in all 50 states), Barack Obama made a previously unscheduled trip to Mexico whereby he ordered biological weapons expert **Marc S Griswold** to transport the A-H1N1 virus from the US biological weapons (HIV, Ebola, Anthrax, GWS, Avian influenza, West Nile Virus, H1N1 influenza) research lab at Fort Detrick Maryland aboard Air Force One to Mexico. A few days later, after Obama arrived in Mexico, the first case of the swine flu was reported in Mexico.

Marc S Griswold, 'Swine Flu victim' Numeror Uno

Biological weapons expert **Marc S Griswold**, who travelled to Mexico with President Obama on April 16, 2009 is the first documented and confirmed A-H1N1 swine flu infection case. The agent is patient zero. Patient zero infected several members of his family in Anne Arundel County, prompting assurances from the White House that the president was safe.

Marc S. Griswold, a **former Secret Service agent** who was serving as the lead advance special agent for Energy Secretary Steven Chu on president Obama's April trip to Mexico, said in an interview that the minor cough he developed in Mexico grew into swine flu. Although he has recovered and is back to work, he and his family have watched in shock as his illness has sparked national security concerns, severely strained his relationship with his brother (Griswold probably infected his nephew) and put his family at the center of rumors and panic in his Severna Park neighborhood. Griswold said in frustration on the front steps of his house. "We've been told we're not contagious. We're already past the seven-day mark for that."

At the White House, press secretary Robert Gibbs did not identify Griswold by name but said officials asked the infected agent whether he remembers coming within six feet of the president during the trip. The answer was no, Gibbs told reporters. Obama's doctor, David Martin, issued a letter to more than 100 White House staffers and reporters, alerting them that they had been exposed but expressing confidence that further infections were unlikely.

"The president, as I've said here many times, has not experienced any symptoms, and the doctors see no need to conduct any tests," Gibbs said.

Griswold stated that his symptoms started innocuously, with a minor cough that began soon after his trip to Mexico as part of the president's entourage.

Obama and Chu, accompanied by Griswold, were part of a "working dinner" in Mexico on April 16. Griswold returned from Mexico on April 18, officials said, on United Flight 822 to Dulles International Airport. When he got home, he chalked up the cough to Mexico's pollution and thought nothing of it the night after his return when he brought a present from Mexico to his brother's house and stayed for dinner.

Griswold's wife, Alison, a registered nurse, was the first to notice something wrong in the family. When she checked on her 7-year-old son at school April 21, something about him seemed off. He said he felt fine and he looked all right, Alison Griswold said. But the school nurse said he had a low fever, so Alison took him home and kept him there for two days until he recovered.

Then she started getting sick: a cough, a high fever and chills. That Friday, Griswold and his wife went to a doctor, who wasn't overly concerned. On Sunday, they saw another doctor, who gave them a flu test that came back negative. On Tuesday, on advice from health officials, the couple and their youngest child got the more thorough nasal swab test.

The results came in Wednesday morning: positive for Type A influenza, probably the swine flu. As reports of their test results reached the White House, officials immediately began piecing together Griswold's brief connection to Obama. Aides began calling people who had traveled with the president and informed the president.

The White House press office began preparing to make a dramatic reversal. For days, Gibbs had insisted there had been no real danger of infection during Obama's Mexico visit. Gibbs shot down repeated questions about health concerns, saying Obama "has not exhibited any symptoms; neither has anybody traveling with him."

Biological weapons expert Marc S Griswold spreads the H1N1 virus globally

How did the H1N1 virus spread?

Marc S. Griswold returned from Mexico on April 18, officials said, on United Flight 822 to Dulles International Airport. Washington Dulles International Airport is a public airport located 25 miles (40 km) west of the central business district of Washington, D.C., in Dulles, Virginia. Dulles is served by nearly a dozen U.S.-flagged carriers and nearly two dozen international carriers. Airlines serving Dulles provide non-stop service to over 80 domestic destinations and to over 40 international destinations. On a typical day, Dulles sees 1,000 to 1,200 flight operations.

When word got out that Agent Marc S. Griswold was infected with the H1N1 virus the government was only concerned about the health of president Obama. No one sought to contact everyone on the same flight as Griswold. If you have a confirmed case of an influenza outbreak the immediate response is for the government to immediately track down everyone who came in contact with Patient Zero and initiate a quarantine. No one, not even Obama, bothered to spring into to action to prevent the spread of the H1N1 virus that the WHO has declared a pandemic. Obama, the WHO and the CDC failed to do their job to protect the people from this influenza outbreak. It is as if they wanted it to happen. Instead of quarantining Griswold, his family, and everyone who came in contact with Griswold on United Airlines Flight 822 they allowed the H1N1 influenza virus to spread. Dulles international airport was the hub for the H1N1 virus to spread globally.

Obama has a responsibility to the people. As president he failed as miserably as George W Bush's handling of Hurricane Katrina. Obama's complete inaction shows complacency. Inaction could also imply conspiracy. Perhaps the rumours are true. Did Obama order a biological attack against Mexico and his own country? What was Obama's motive to unleash a biological weapons grade influenza strain? What was the means? What opportunity did he have? Motive could be the Tax Day Tea Party which millions of ordinary US citizens participated in as a nation wide protest against Obama's government policies and out of control spending that occurred on April 15, 2009 - the day before Obama landed in Mexico.

Not even in office 100 days the people were angrily protesting and petitioning Obama and his government for change. Did Obama fear they would ask for his resignation? Did he react out of anger because the US people no longer saw him as their saviour and out of anger ordered the H1N1 virus released? He surely had the means. Fort Detrick where this new viral infection was created is just outside Washington DC. He did have Air Force One at his disposal as a means to transport the virus from Fort Detrick to Mexico. Air Force one is considered US soil no matter where it lands and as such no country can board it or inspect it. He did have an excuse to go to Mexico right away. Mexico had a very violent and deadly drug war going on until the first case of H1N1 virus was reported in Mexico. Before the H1N1 virus outbreak the news was reporting daily about the battle between the Mexican government and the drug lords. Bodies were being discovered by US border guards on a daily bases. That has all but stop as a result of the H1N1 flu.

On Saturday October 23, 2009 Obama declared a national state of emergency as a result of the sharp rise in the number of people who have now become infected with the A-H1N1 or swine flu virus. Obama, the WHO and the CDC have declared that millions of American are now infected with the virus. That is what is known as a half-truth. Yes millions are infected but the truth is how they became infected. The millions of Americans who are now infected were not infected naturally. Millions were infected by the Obama ordered nation wide vaccination program. The vaccination program is a bio-terrorism attack against the American people and the World population. Only a handful of American were infected with the A-H1N1 virus naturally - from another infected person.

Millions became infected only after they got the vaccine or nasal spray. Both the vaccine and the nasal spray are the bio-terrorism dissemination tool that the bio-terrorists Barack Hussein Obama, Dr. Margaret Chan and Dr. Thomas R. Frieden used to commit their crimes of bioterrorism, crimes against humanity, genocide and conspiracy to commit mass murder.

Under orders from Barack Hussein Obama, Dr. Margaret Chan and Dr. Thomas R. Frieden vaccine makers have manufactured biological weapons grade vaccines and begun shipping:

- Live Attenuated Influenza Vaccine (LAIV) nasal spray for H1N1 flu, and
- 15 microgram pre-filled syringes for use in children age 4 and older
- Multidose vials for persons 6 months of age and older ...

The CDC isolated and genetically altered (engineered) the H1N1 flu virus so that it can be used to make hundreds of millions of doses of the bio-terrorism agent. The new genetically engineered (novel) A-H1N1 virus now contains a lethal combination of bacteria, viruses, and toxins.

Some 11 million doses of the CDC genetically engineered H1N1 virus have been shipped to all 50 states as of October 21, 2009 to deliberately cause the illness or death of millions of American people. Children and pregnant women are Obama's, the WHO and the CDC main target. They are at higher risk of complications. Children and pregnant women have under developed or compromised immune systems so they are unable to combat the biological weapon called the swine flu or A-H1N1 virus. The vaccine is a cocktail of bacteria, viruses, and toxins which will make every child and pregnant women who gets vaccinated very sick and/or die. The next largest group of people who are being targeted by the bio-terrorists Obama, Dr. Margaret Chan and Dr. Thomas R. Frieden are the elderly. They too are easily infected as their immune system have greatly degraded because of their age. The third group being targeted are the chronically ill. All will die if they are infected with the live A-H1N1 virus and other toxins that make up the Obama biological weapon called the Swine Flu Vaccine. The chronically ill cannot fight off both their existing illness or disease and the highly concentrated dosage of the swine flu virus that is in every vaccine.

Obama, Dr. Margaret Chan and Dr. Thomas R. Frieden are all guilty of bioterrorism, crimes against humanity, genocide and conspiracy to commit mass murder. Their crimes are most heinous than all the combined crimes of every terrorist attack that has ever occured, both in the US and elsewhere in the World. Their crimes are greater than those that occured on September 11, 2001 because their crimes will murder millions whereas 9/11 took only 2993 people, including the hijackers. Their crimes are more heinous than Saddam Hussein's killing of 148 Iraqi Shi'a Muslims in 1982 using chemical weapons provided by the US government. Their crimes are greater than what Churchill did to Europe. Joseph Stalin, Adolf Hitler and Barack Obama all came to power at a time of extreme instability in their countries. All took advantage of the chaos going on in their countries to seize power and garner political support for their totalitarian causes.

Obama, Dr. Margaret Chan and Dr. Thomas R. Frieden crimes are crimes against humanity because they are targeting and killing millions of civilians - mainly women, children and the elderly. Crimes against humanity, as defined by the Rome Statute of the International Criminal Court Explanatory Memorandum, "are particularly odious offences in that they constitute a serious attack on human dignity or grave humiliation or a degradation of one or more human beings. The London Charter of the International Military Tribunal defined crimes against humanity as: "Murder, extermination, enslavement, deportation, and other inhumane acts committed against any civilian population, before or during the war, or persecutions on political, racial or religious grounds in execution of or in connection with any crime within the jurisdiction of the Tribunal, whether or not in violation of the domestic law of the country where perpetrated".

Obama, Dr. Margaret Chan and Dr. Thomas R. Frieden crimes are a deliberate and intentional killing of large numbers of civilians for political or other purposes. That is not tolerable under the international systems. And it should be prosecuted pursuant to the existing laws. . . . We're not re-writing any rules. We don't have to re-write any rules. We have to apply the existing rules. We have to make them accountable for their crimes and that is why every law enforcement agency in the World must seek them out (wanted) for bio-terrorism, crimes against humanity, genocide and conspiracy to commit mass murder.

Nano-Partikel: Giftzwerge im Impfstoff

Dilla's & Eva's ...Forum, 27 October 2009
https://www.carookee.de/forum/Damals-Heute-Morgen/67/24880595-0-01105?print
http://www.goldseitenblog.com/muellenmeister/index.php/2009/11/27/nano-partikel-giftzwerge-im-impfstoff

Die Auswirkungen von Nano-Partikeln als Wirkverstärker im Schweinegrippe-Impfstoff sind bisher kaum bekannt. Ein Beispiel dafür, was uns allen bald blühen könnte, wenn wir im Großversuch zur Schlachtbank schreiten, geben die Indianer in Kanada.

Umgeben vom Nimbus des Wohlwollens, genoss die Nanotechnologie wie die Wohlfühlworte "Bio" oder "Wellness" lange Zeit volle Sympathie. Inzwischen scheint die Euphorie der 90er Jahre verflogen, als man noch die Nanos auf dem Altar der Wissenschaft als Zukunftstechnik beweihräucherte. Jetzt rückt erstmals die Kehrseite der Nanotechnologie ins Bewusstsein der Bevölkerung - durch Impfstoffe mit Wirkverstärkern, den sogenannte Adjuvantien im Nanobereich.

Was macht diese synthetischen Nano-Partikel so attraktiv? Diese Winzlinge - nano griechisch Zwerg - unter 100 Nanometer, dem Milliardste Teil eines Meters groß, nehmen völlig neue Materialeigenschaften an: Verbesserte und völlig neue Lösungen ergeben sich bei Werkstoffen, in der Informationstechnologie, Umwelttechnik und auch in der Medizin. Winzige Partikel sind dabei, die Medizin zu verändern. Laboruntersuchungen werden einfacher, Computer- und Magnetresonanz-tomographie besser und Arzneistoffe werden dorthin transportiert, wo sie ihre Wirkung entfalten sollen. Oh, du schöne neue Nanowelt!

Wie verhält es sich aber mit der Verträglichkeit der Nanoteilchen gegenüber Mensch und Umwelt? Wie regieren menschliche Zellen, wenn sie mit den Tausend mal kleineren Nanopartikeln in Kontakt geraten, sie von ihnen sogar durchdrungen werden. Bedenken Sie: makrokosmisch gesehen verhält sich ein Nanoteilchen in der Größe zu einem Tennisball ebenso wie dieser zur Erdkugel. In der mikrokosmischen Welt sind aber die meisten physikalischen Gesetzmäßigkeiten außer Kraft gesetzt, und quantenphysikalische Effekte dominieren. Die veränderten Eigenschaften erklären sich durch die deutlich vergrößerte Oberflächenenergie der Materialien: die Nanostruktur erlaubt deutlich mehr Oberflächenatome.

Erst jetzt spürt man toxikologische Risiken bei Nanomaterialien nach, die in Verdacht stehen, Schäden an Zellen und Nerven, vor allem im Hirn auszulösen. Noch sind dezidierte Aussagen wegen der Vielfalt der Nanomaterialien nicht möglich. Das ökologische Risikopotential kann sich selbst bei ein und dem selben Material durch unterschiedliche Größe oder Struktur im Nanobereich radikal ändern.

Längst sind Impfstoffe, also Vakzinen, für die Pharmaindustrie die heilbringenden Gelddruck-maschinen für bedrohte Unternehmensbilanzen. Erst recht, wenn diese mit Wirkverstärkern, also mit Adjuvantien versetzt sind. Dann nämlich bedarf es viel weniger an Impfstoff. Nicht nur in der umstrittenen Schweinegrippe-Spritze, auch im GSK-Impfstoff Cervarix gegen Gebärmutterhalskrebs sei ein verstärkender Zusatz enthalten. Da darf man Zweifel an der Integrität der Forscher haben. Sie sind den Pharmalöwen verpflichtet. Und es geht um viel Geld. Inzwischen sind in Europa drei Pandemie-Impfstoffe nach diesem "Zuschnitt" endgültig zugelassen, zwei davon enthalten Nanozusätze. Durch den Sog des Stoffwechsels verteilen sich geimpfte Nanopartikel im ganzen Körper, wandern durch Zellen, Gewebe, Organe und schädigen oder zerstören diese. Sie überwinden die Blut-Hirn-Schranke, landen im Hirn und verursachen dort Schäden und Zerstörung.

Nanopartikel im Impfstoff empfiehlt die US-gesteuerte und mit Vertretern der Pharmariesen infiltrierte Weltgesundheitsorganisation weltweit. Urkomisch: in den USA selbst genügt eine nanopatikelfreie Impfung! Das legt die Frage nahe: Wieso wird mit zweierlei Maß gemessen? Will die USA wieder als gestärkte Weltmacht aus der Pandemie hervorgehen? Peinlich: Inzwischen springt der smarte US-Präsident im Karree, denn er rief den Notstand aus. Unser Paul-Ehrlich-Institut PEI versucht als Sprechblase die Nanopartikel in den Pandemie-Impfstoffen als biologisch und harmlos zu verniedlichen. Müsste man da nicht die noble Institution umtaufen in das "Saulus-Lügen-Institut" SLI.

Eine Lüge erbt sich wie eine ewige Krankheit fort, denn unsere medizinisch wie immer gut unterrichtete Regierung leugnet frech die Nanopartikel in Impfstoffen. Die Wirkverstärker MF59 und AS03 in den Pandemie-Impfstoffen bestünden nicht als Nanoteilchen und seien unbedenklich. Werden die 27 mg Nanopartikel durch eine feine Hohlnadel in den Körper eingeschleust, können diese den Körper nicht mehr verlassen; der Wundkanal verschliesst sich gleich wieder und die implantierten Gifte können nicht herausfliessen oder herauseitern.

Damit ist der Lügen-Potpourri keineswegs zu Ende. Die dreiste Behauptung der biologischen Abbaubarkeit ist eine weitere vorsätzliche Lüge. Ziel ist es, die Akzeptanz der Bevölkerung zu bekommen, damit sich Millionen Menschen diese Nanopartikel verpassen lassen. Aber selbst eine biologisch abbaubare Substanz verhält sich im Gemisch mit anderen Komponenten anders. Technische Mehrkomponenten-Nanopartikel arbeiten sich unbehelligt entlang der Stoffwechselwege durch den ganzen Körper. Letztendlich landen sie im Hirn. Bedenken Sie: das Hirn hat nur 2% der Körpermasse, verbraucht indessen mindestens 20% der gesamten Energie, über die ein Mensch verfügt. Es wird also am intensivsten versorgt und zieht über den Sog des Stoffwechsels die meisten Stoffe an.

Und weiter geht's im Lügen-Potpourri der Regierung. Für die verwendeten Adjuvantien MF59 und AS03 gäbe es schon umfangreiche Daten zur Verträglichkeit, heißt es. Zum Sicherheitsrisiko dieser Nanopartikel gibt es aber keine öffentlichen Daten, und zwar von keiner Institution. Und keine Impfschadensforschung! (www.staatsbuerger-online.de).

Interessant zu wissen: Das US-Militär testet diese Wirkverstärker seit Jahren illegal an uninformierten und wohl auch ahnungslosen US-Soldaten, von denen Zehntausende verkrüppelt wurden und Tausende starben. Sie verpflichtete die Hersteller von Nanopartikel-Impfstoffen, die Wirkverstärker gesondert abzufüllen. Warum wohl?

Die deutsche Regierung verspricht den Herstellern bei auftretenden Schäden Straffreiheit und versucht, die ganze Verantwortung auf die impfenden Ärzte abzuschieben. Das allein ist schon unglaublich. Und was geschah jüngst in Kanada?

Es ist immer noch Gesetz in Kanada, dass sich Indianer keiner medizinischen Behandlung entziehen dürfen. Kein Wunder, dass in den Reservate die ersten Feldversuche stattfinden; da wird mit ungeprüften potentiell tödlichen Impfstoffen laboriert. Letzte Woche wurden viele Ureinwohner an der entlegenen Westküste im Dorf Ahousaht/ Kanada mit dem H1N1-Impfstoff geimpft. Bereits heute sind mehr als Hundert von ihnen krank, und die Krankheit breitet sich aus. Inzwischen wurden Leichensäcke von Manitoba aus geschickt (http://kochministry.wordpress.com/2009/09/23/schweinegrippe-kanada). Die Indianer sind unfreiwillige Testpersonen in Kanada. Ein Beispiel dafür, was uns allen bald blühen könnte, wenn wir zum Großversuch zur Schlachtbank schreiten. Diese technischen Waffen an der "Ausdünnung" der Ureinwohner wird jetzt auch gegen den "normalen" kanadischen Bürger eingesetzt.

Die tatsächliche Pandemie wird **nicht** durch das H1N1-Virus ausgelöst, sondern durch die Impfstoff-Hype. Diese wird mit Nachdruck von den Regierungen und den Pharma-Giganten wie Novartis und Glaxo Smith Kline durchgesetzt. Widerstand regt sich zwar in breiten Bevölkerungskreisen, aber er formiert sich nicht. Noch nicht.

Quelle: "Immer weigere ich mich, irgendetwas deswegen für wahr zu halten, weil Sachverständige es lehren, oder auch, weil alle es annehmen. Jede Erkenntnis muss ich mir selbst erarbeiten. Alles muß ich neu durchdenken, von Grund auf, ohne Vorurteile." Albert Einstein (1879-1955)

Наночастицы: Смертельно опасные карлики в вакцине

Перевод с немецкого Анны Чижовой
Под редакцией Александра Тарасова
http://saint-juste.narod.ru/nanochast.html

Мало кто сегодня знает, к чему ведет использование наночастиц в качестве усилителей действия вакцины против свиного гриппа. Примером того, что ждет всех нас, если мы в ходе этого крупномасштабного эксперимента послушно зашагаем на скотобойню, служат канадские индейцы.

Нанотехнологии, как и то, что именуют благозвучными словами «велнес»[I] или «био», долгое время вызывали практически всеобщий восторг. Сейчас, похоже, эйфория 90-х, когда на алтаре науки им курили фимиам как «технологиям будущего», улетучилась. Сегодня населению впервые открывается оборотная сторона сферы нанотехнологий – вакцины с усилителями действия, так называемыми адъювантами[II].

Что же делает эти синтетические наночастицы такими привлекательными? Эти карлики (нано —— по-гречески карлик), величиной меньше ста нанометров, то есть миллиардной части метра, обладают совершенно новыми физическими свойствами и делают возможными улучшенные или совершенно новые решения в сфере производства материалов, информационных технологий, защиты окружающей среды. Крохотные частицы меняют медицину: лабораторные исследования становятся проще, компьютерная и магнитно-резонансная томография точнее, а лекарственные вещества можно доставить точно к тем местам в организме, на которые они должны действовать. О дивный новый наномир!

Но насколько хорошо наночастицы переносятся организмом и окружающей средой? Как ведут себя человеческие клетки, когда с ними в контакт вступают в тысячи раз меньшие по размеру объекты, буквально пронизывая их насквозь? В макромасштабе наночастица соотносится по размеру с теннисным мячом так же, как последний с земным шаром. Но в микромире бóльшая часть физических законов перестает действовать, и начинают доминировать квантовые эффекты. Изменение свойств объясняется существенным увеличением поверхностной энергии веществ: наноструктура предполагает наличие гораздо большего числа поверхностных атомов.

Только сейчас начинается изучение токсикологического риска при использовании наноматериалов, которые, как можно предположить, повреждают клетки и нервы, прежде всего головного мозга. Но прийти к однозначному выводу пока не позволяет многообразие наноматериалов. Потенциальные риски использования даже одного и того же материала для различных размеров и структур могут радикально различаться.

Уже давно прививки стали для [капиталистической] фарминдустрии «печатным станком», спасающим предприятия от банкротства. Однако это относится только к вакцинам, содержащим усилители действия (адъюванты). Дело в том, что при их применении требуется гораздо меньше активного вещества, чем в обычных вакцинах. Усиливающие добавки есть не только в вызывающей множество споров вакцине против «свиного гриппа», но и в вакцине «Церварикс»

против рака шейки матки (производится фармацевтическим гигантом «ГлаксоСмитКляйн»). Не вправе ли мы усомниться в беспристрастности исследователей, которые напрямую зависят от фармацевтических концернов? Ведь речь идет об очень больших деньгах. А между тем в Европе из трех получивших официальное разрешение вакцин против пандемии свиного гриппа [III] две содержат нанодобавки. Введенные с вакциной наночастицы распространяются по всему организму, проходят через клетки, ткани и органы, повреждая или разрушая их. Они свободно преодолевают гематоэнцефалический барьер, попадают в мозг и травмируют или разрушают его клетки.

Всемирная организация здравоохранения, находящаяся под контролем США, и в которой кишмя кишат представители фармацевтических концернов, рекомендует вакцину, содержащую наночастицы, всем странам мира. Самое смешное, что в самих Соединенных Штатах прививки без наночастиц считаются вполне достаточными. Возникает вопрос о двойных стандартах. Америка хочет укрепить свой статус мировой державы за счет еще одной пандемии? Неловкая ситуация: президент США вне себя, ведь он уже объявил чрезвычайное положение [IV]. Институт Пауля Эрлиха[V] постоянно твердит о биологической чистоте и безопасности нановакцин против пандемии свиного гриппа. Может, стоит переименовать прославленный Институт имени Честного Павла в Институт имени Лживого Савла («Saulus-Lügen-Institut»)?[1]

Ложь передается дальше, как наследственное заболевание, ведь наше, как всегда, хорошо осведомленное в медицинских вопросах правительство, нагло отрицает присутствие наночастиц в вакцинах. Усилители MF59 и AS03 в прививках против пандемии якобы не являются наночастицами и потому якобы не должны вызывать опасений. Игла вводит в организм 27 миллиграммов наночастиц, которые уже никогда из него не выйдут: ранка закрывается мгновенно, а частицы не могут быть выведены наружу ни с жидкостью, ни с гноем.

Попурри лжи на этом не заканчивается: смелое утверждение о возможности биологического расщепления наночастиц – еще одна умышленная ложь с целью получить одобрение населения и добиться того, чтобы миллионы людей позволили ввести себе наночастицы. Но даже и биологически расщепленная наносубстанция при смешении с другими компонентами ведет себя совершенно иначе. Техничные многокомпонентные наночастицы легко проходят через весь организм по каналам обмена веществ, в конце концов попадая в мозг. Представьте себе: мозг, составляя только два процента от общей массы тела, потребляет, по меньшей мере, 20 % имеющейся в распоряжении человеческого организма энергии. Таким образом, именно он наиболее интенсивно снабжается в процессе метаболизма и получает бóльшую часть активных веществ.

Но правительственное попурри лжи и на этом не заканчивается. Применительно к адъювантам MF59 и AS03 уже будто бы имеются многочисленные данные, доказывающие безопасность этих адъювантов для организма человека. Но данные, безопасны наночастицы или нет, не опубликованы ни одной организацией. Так же, как нет ни одного исследования вредоносности вакцин с наночастицами[2].

Интересный факт: американские военные уже многие годы нелегально тестируют эти усилители действия на ни о чем не подозревающих солдатах, из которых десятки тысяч остались калеками и тысячи умерли. Военные обязали производителей вакцин, содержащих наночастицы, использовать для усилителей отдельные емкости. С чего вдруг?

Немецкое правительство гарантирует производителям безнаказанность в случае нанесения нановакцинами вреда здоровью пациентов и пытается свалить всю ответственность на врачей. Одно это чудовищно. Не говоря уже о том, что произошло недавно в Канаде.

Здесь, в Канаде, действует старый закон, по которому индейцы не имеют права уклоняться от какого бы то ни было лечения. Неудивительно поэтому, что первые полевые испытания были проведены в резервации – ее сделали лабораторией для работы с непроверенными потенциально опасными вакцинами. На прошлой неделе многим коренным жителям деревни

Ахоусахт[VI] на отдаленном западном побережье были введены вакцины против вируса гриппа H1N1. Сегодня уже более ста из вакцинированных больны, и болезнь распространяется дальше. Из Манитобы уже везут мешки с трупами[3][VII]. То, как индейцев помимо их воли превратили в подопытных, – хороший пример того, что вскоре ждет нас всех, если мы послушно зашагаем на скотобойню крупномасштабного эксперимента [корпораций]. Это техничное оружие прореживания коренного населения сейчас может быть направлено и на «нормальных» канадских граждан.

Настоящая пандемия – не пандемия, вызванная вирусом H1N1, а пандемия истерии вокруг нанопрививок. Их насильно навязывают правительства и такие фармацевтические концерны, как «Новартис» и «ГлаксоСмитКляйн». Хотя недовольство в широких слоях населения и возникает, но сопротивление не формируется. Пока.

[I] Велнес – ставшая модной в 90-е гг. XX в. среди обеспеченных слоев населения «первого мира» концепция «здорового образа жизни и душевного благополучия», основанная на «правильном питании» (обычно «натуральном»), физических нагрузках (фитнес и т.п.), отказе от вредных привычек и т.д. Быстро возникла индустрия велнеса, требующая от его адептов немалых затрат.

[II] Адъюванты – вещества, которые используются для усиления иммунного ответа при вакцинировании (поскольку большинство вакцин обладает слабым иммунизирующим действием). Первые адъюванты получены в 1925 г.; некоторые из адъювантов (в частности, на основе алюминия) – высокотоксичны.

[III] Которая так и не разразилась и, судя по всему, все крики о ней были искусственно вызваны фармацевтическими корпорациями с целью получения сверхприбылей.

[IV] Чрезвычайное положение в США в связи с «пандемией свиного гриппа» было объявлено Б. Обамой 24 октября 2009 г. Всего в 2009 г. в США заболело свиным гриппом свыше 43 700 человек, что, очевидно, даже меньше, чем сезонная вспышка гриппа.

[V] Институт Пауля Эрлиха – государственное учреждение ФРГ, которому делегированы права по контролю деятельности организации служб крови, качества препаратов крови, разрешению применения различных медицинских технологий (включая вакцинацию людей и животных и использование препаратов, содержащих антитела и аллергены, а также препаратов генной терапии). Назван в честь своего первого директора, знаменитого врача П. Эрлиха (1854–1915), лауреата Нобелевской премии за 1908 г.

[VI] Ахоусахт – одно из индейских племен, входящих в состав народа нучанулт (известного в России как нутка). Все нучанулты живут на Тихоокеанском побережье Северной Америки (в Канаде и США). Ахоусахты проживают на острове Ванкувер (провинция Британская Колумбия, Канада), в резервациях. Численность племени превышает 1800 человек, условия жизни в резервациях неблагоприятны, безработица превышает 20 %. Ахоусахты традиционно занимаются рыболовством, добычей моллюсков, а в последние десятилетия – лесоразработками.

[VII] Очевидно, речь идет о каком-то другом случае, поскольку Манитоба – это другая провинция Канады. На территории Манитобы также существуют индейские резервации.

Vaccinations for better or for worse?

InfoWars / Prison Planet, 31 October 2009
https://web.archive.org/web/20091104112128/http://www.infowars.com/vaccinations-for-better-or-for-worse/

There are some fundamental questions that should be asked of any proposed treatment including vaccines. Does it do what it claims it will do? What are the benefits? What are the risks? What are the alternatives? How has the proposed treatment been promoted to physicians and the public? Yet, as I have demonstrated in my last article entitled "Stop the Swine Whine," these questions have been largely ignored by H1N1 flu commentators, who have substituted propaganda, hysteria, and fear-mongering for legitimate information.

It is under the backdrop of the H1N1 flu hysteria that the FDA has quietly approved another human papilloma virus (HPV) vaccine for girls and for the first time, an HPV vaccine for boys. These vaccinations, according to the vaccine makers, will dramatically lower cervical cancer rates in women and genital warts in men. Or will they? As usual, the truth is much more complicated. With the advent of regular Pap smear screening of women in the U.S., the mortality rate from cervical cancer has dramatically decreased. Now, compared to some other cancers like breast and lung cancer, cervical cancer kills a relatively small 4,000 women in the U.S. per year. As a result, the majority of cervical cancer victims come from the third world where regular screening is not the standard of care.

While every death due to cervical cancer is regretful, will the vaccine really decrease these mortality numbers any further? The answer to this question is supremely important because if it is shown that the vaccine has no benefit or is only marginally effective, then the whole framework of HPV vaccination would be in doubt. In order to answer this question we must ask how 4,000 women could die from cervical cancer when they are receiving regular screening. Surely, a cancer that is known to take up to a decade or more to develop from initial pre-cancerous changes would be caught well in advance before it became problematic. So why are women still dying? The answer is intuitively obvious. The 4,000 are comprised of a subpopulation of women defined as underserved that don't go to the doctor to get screened in the first place, much less get vaccinated. It is frequently these women that show up in the emergency room with inoperable and incurable invasive cervical cancer. Therefore, it is also these women that contribute the vast majority of deaths related to cervical cancer.

So why promote a vaccine to a population of women that are already getting regular screening and will not likely get any mortality benefit? Should not the vaccine makers be promoting their vaccine exclusively to the high-risk population that is not likely to obtain routine screening? Of course, this logical approach would not pay back any research and development investment or put money into the corporate offices of these companies.

Withheld from the public by the mainstream media have been an increasing number of physicians and scientists coming out against the vaccine and its supposed benefits. Recently, for example, "Columbia University professors Sheila M. and David J. Rothman published an article in the Journal of the American Medical Assn." blasting Merck, which produces the Gardasil HPV vaccine "for paying grants to medical organizations that are strong advocates for vaccination. 'Telling every mom she needs to get her daughters vaccinated to protect them from cancer is creating a market out of thin air,' David Rothman says. 'They're already protected' through regular Pap smears, he adds." (1)

Another researcher, Dr. Diane Harper, who participated as the "lead researcher in the development of two human papilloma virus vaccines, Gardasil and Cervarix, said the controversial drugs will do little to reduce cervical cancer rates and, even though they're being recommended for girls as young as nine, there have been no efficacy trials in children under the age of 15." (2)

She has also added that because the rates of cervical cancer are already so low that "even if we get the vaccine and continue Pap screening, we will not lower the rate of cervical cancer in the US." (2)

The next logical question is that if all cervical cancer can be prevented by the HPV vaccine then why can't we just stop performing Pap smears in women and just give them the vaccine instead? When I have talked to patients and even some physicians about the HPV vaccine, I have consistently been presented with the misconception that the vaccine is 100 % protective against cervical cancer. The truth is that the vaccine protects against two strains of HPV – HPV 16 & 18, which are thought to be responsible for only 70% of cervical cancer cases. So despite the vaccine, women could be still infected with HPV strains that cause up to 30% of cancer cases. It is because of this that women need to continue regular screening just as they have already been doing. Therefore, the added layer of the vaccine adds nothing more than cost to the existing Pap smear screening regiment.

In addition, there are no long term studies that demonstrate that the vaccine truly prevents cervical cancer itself and not just infection rates. There is also no data that shows that the protective effects of the vaccine will persist into a woman's 30s, 40s, and 50s when cervical cancer is most predominant. So far, the vaccine has been marketed, approved, and given to young women almost exclusively.

What about the risks?

The vaccine makers claim that the HPV vaccine carries no long-term side effects. However, the "Vaccine Adverse Event Reporting System (VAERS) has received more than 15,000 reports of reactions to the vaccine, including more than 3,000 injuries and 48 deaths" after patients received the Gardasil vaccine. (3) While these reactions may not be all attributable to the vaccine, it is clear that reactions, sometimes severe, have occurred after vaccination.

Has this information caused the vaccine makers to withdraw their promotional material and cervical cancer reduction claims? Quite the contrary, their promotion efforts have continued. The Gardasil vaccine, with sales of $1.4 billion in 2008, has not only received generous advertisement promotion but has also been promoted through generous donations to physician organizations such as the American College of Obstetricians and Gynecologists (ACOG) and Society of Gynecologic Oncologists. It is these organizations that have further disseminated HPV vaccine hysteria to member OB/GYNs and primary care providers. In addition, "Merck has been lambasted for tactics such as lobbying lawmakers to make vaccination mandatory." (1)

In a final straw, Merck has sought and been approved by the FDA to vaccinate boys with Gardasil. This vaccination, which as has been demonstrated can cause serious side effects, will now be given to boys in order to treat relatively innocuous genital warts and extremely rare penile cancer. I am sure that it is no coincidence that according to Bloomberg, "approval in boys could add as much as $200 million to $300 million in annual sales" to Merck. (4)

What has been lost in all the disinformation has been the requirement of sexual intercourse for transmission of the Human papilloma virus. All it would take to put a stop to cervical cancer for good would be for providers to promote and patients to practice monogamy. As usual, this aspect has been downplayed by the vaccine makers.

Vaccine Victims Blamed for National Emergency: Humanicide and What's Next

Prevent Disease, 13 November 2009
https://web.archive.org/web/20100102095323/http://preventdisease.com/news/09/111309_vaccine_victims_blamed_emergency.shtml

In Salem, Massachusetts, in 1692, medical doctors failed to determine the cause of bizarre behavior among youngsters in that town. Religious zealots, steeped in their cult, diagnosed satanic possession to justify criminal prosecutions and serial slayings.

The publication of "Why you can't get swine-flu vaccine" in Rupert Murdoch's New York Post (Nov. 3, 2009) by Robert Goldberg, Vice President of the Center for Medicine in the Public Interest, proves how human intelligence has devolved since Salem's victims were blamed to popularize status quo psychopathology, social injustice, and mass murder otherwise called institutionalized genocide.

According to Goldberg, partnered with Peter Pitts, mainstream media's health pundits for consumer protection, the H1N1 National Emergency declared by Barack Obama is due to fringe lunatics who think mercury is harmful when injected by vaccines; not "vaccine shortages".

Goldberg blames people like me for heralding mercury toxicity's links to neuro-developmental and behavioral disorders in children (e.g., autism). We are blamed for allegedly pressuring governors into ordering single versus multi-dose vials (as if the government of the US has ever listened to vaccine prohibitionists). The different vials have differing mercury concentrations (which indicts lacking industry standardization of heavy metal toxic mercury levels evidencing gross criminal negligence rationalized by pseudoscience) and the single dose vials are more costly and time-consuming to produce. Thus, we victims of mercury intoxication and vaccine injuries are blamed for the alleged vaccine shortage and national Model State Emergency Health Powers Act implementation advancing across the country.

They are Killing Us

I suffer from eczema--a common condition linked by science to vaccine mercury and/or injected foreign proteins causing multiple chemical sensitivities and autoimmune conditions. Vaccine-linked eczema now curses between 10-15 percent of the American people. Eczema is most often caused by vaccination intoxication. Human bodies are injected with mercury and foreign proteins that attach to normal body parts. The combination of mismatched protein parts forms an "antigenic complex" that is attacked by white blood cell bodyguards. This results in the vast majority of autoimmune diseases, including eczema. Such diseases profit petrochemical-pharmaceutical industrialists.*

My mother died of Guillain-Barre Syndrome (GBS) from the 1976 Swine Flu Vaccine campaign. My sister-in-law was crippled with rheumatoid arthritis (RA) from a hepatitis B vaccine. My brother-in-law receives Canadian military compensation for a vaccine injury called multiple sclerosis (MS). My best friend has type-1 diabetes thanks to a flu shot. These illnesses are all autoimmune diseases proven in science to be linked to, or caused by, vaccinations.**

I testified briefly before the US Congress on vaccine mercury's link to autism. I personally witnessed legislative officials' gross criminal neglect of the scientific study commissioned by the US Centers for Disease Control (CDC) by Verstraeten, et. al, titled, "Thimerosal VSD Study: Phase I-- Update 2/29/00." Herein, definitive links between vaccine mercury intoxication and neuro-developmental and behavioral disorders in children were reported. This report was originally censored, then modified, for subsequent official publications eliminating all findings condemning vaccine mercury, thus keeping autism a "medical mystery."

Today, everyone practicing any form of natural medicine is endangered. Energy medicine is particularly suppressed along with paradigm-shifting biophysics, hydrosonics, and electrogenetics that could eliminate all reliance on drug industrialists. Practitioners in these fields are persecuted for truth-telling about vaccine illnesses and deaths linked to mercury poisoning and antigenic complexes.**

History Repeating

Medical industry censorship and persecution is reminiscent of the mysterious Salem witch trials. Historians speculate a combination of events, including an untimely smallpox outbreak, created the climate for this public fright. One-hundred and forty people were accused of witchcraft. Forty-three people were supposedly afflicted. Nineteen people were hanged, one person was pressed to death, thirteen people died in prison, and as many as 1200 persons were victimized in other ways.

What terminated this deadly madness is the same reason Rupert Murdoch's yellow press, the New York Post, published Robert Goldberg's diatribe. Public support and false belief in the "witches" began to wane; as is happening now with growing distrust of vaccines and fraudulent vaccine trials. The "silent majority" sees through transparent safety assurances and government intrusions into our lives. People are frightened and fed-up with deadly disasters like the Merck company's VIOXX and 1976 Swine Flu vaccine fraud, both certified by the US Federal Government.

Respected Salem ministers started to believe that some innocent people were being accused and executed for witchcraft primarily on unreliable spectral evidence (such as Goldberg presents). Today, confessions by doctors and scientists who once worked for drug giants are truth-telling, whistle-blowing, and discrediting the vaccine makers and their safety assurances over the Internet.

As the Reverend Increase Mather stated, "It were better than ten suspected witches should escape than one innocent person should be condemned." I say, "it is better that ten vaccine-prohibitionists be condemned by medical madmen than one innocent child suffer neuro-degeneration from vaccine mercury intoxication."

The Salem Witch Trials website explained, "As the accusations mounted, persons from all walks of life--rich and poor, beggar and merchant--were being accused. Additionally, the accused that originally confessed to witchcraft requested to recant their former confessions. With public confidence in the trials slipping, the cries of the afflicted were steadily ignored, and the accusations eventually stopped."

So increasingly ridiculous accusations from the status quo, such as Goldberg's, are disbelieved by increasing numbers of vaccine victims. The majority of people now see through BigPharma's fear-inflicting propaganda, exemplified by Murdoch's articles, wherein "We the People" are accused of madness, ignorance, and now allegedly causing a national emergency.

Public confidence in medicine is at an all-time low following the medically-assisted demise of our parents, friends, and siblings. The leading cause of death today is drug-induced illnesses; and these shocking statistics omit all vaccine injuries since officials criminally neglect surveying and reporting the sick and dying who's only mistake was their misplaced faith in drugs and medical deities.

It is said that medicine has extended longevity, but degenerated quality of life making death seem more appealing than drug additions and lethal side effects for millions.

Murdoch's Media-Driven Humanicide

For those who don't know, Rupert Murdoch controls the majority of American news media.

Recently, investigative journalist Sherri Kane and I exposed gross conflicting interests between Rupert Murdoch and the global drug cartel. Pregnant women were tested for H1N1 vaccine side effects using a bogus study design at Elizabeth Murdoch's Royal Women's Hospital in Australia. Rupert's daughter-in-law, Susan, oversees the Murdoch Children's Research Institute (MCRI) wherein infants and children were tested with H1N1 vaccines by Merck's subsidiary, CSL, Inc. James Murdoch, heir-apparent to Rupert's estate, oversees the Board of Directors of Glaxo-SmithKlein, another H1N1 Swine Flu vaccine maker. All of the above Murdoch affiliates administered fraudulent H1N1 vaccine studies that neglected placebo control groups and long-term surveillance to fraudulently erase statistically significant risks and provable "adverse events."

Rupert Murdoch is Co-Chairman of the David Rockefeller founded, Royal family of England chartered, Partnership for New York City (PFNYC). This is the world's most powerful biotechnology trust – the heart of the vaccine industry, "genetopharmaceuticals," and mass-media mind controlling social engineering. This is the heart of the American Medical CULTure. Their prostitutes promote and prey on people's fear, magnify microbial menaces, and persecute natural healers and alternative care providers as though they were witches practicing witchcraft.

David Rockefeller also directs the wealthy powerful Council on Foreign Relations (CFR). He co-founded, with The Rockefeller Brothers Fund, the influential Population Council. The former is the most powerful US Government think tank and policy director. The later is the world's most active depopulation organization funded by the US Government and Rockefeller-related foundations and institutions. The Population Council's goal is to reduce populations by nearly two-thirds through intoxicating drugs and vaccines, including those that cause sterility. They advocate the 1977 book, Ecoscience, co-authored by Obama administration science czar, John Holdren, calling for massive global depopulation using vaccinations for sterilization.

Evidencing this group's power, on October 16, 2009, a special gathering of CFR joined vaccine specialists and social engineers led by health media propagandist, Laurie Garrett, discussed the urgency of the vast majority rejecting vaccinations for H1N1. They articulated the need to use "shortage marketing" (i.e., fraudulently claiming vaccine shortages) to promote better public acceptance of the distrusted vaccines. Prior to this meeting, the nation's vaccine supplies were reported ample. After this meeting the media began administering shortage marketing, and hypnotizing the panicked public who lined up for their shots.

Another example official malfeasance at the highest levels of government involves the PFNYC Co-Chair, Lloyd Blankfein, the Chairman and CEO of Goldman Sachs & Co., whose manager of private client services, Linda Daines, is wife of New York State Health Commissioner, Richard Daines. The Daines's profit from vaccine sales to New York State (legally another member of PFNYC) and other governments, including the US Federal Government (officially another member of PFNYC) that stockpiles the H1N1 Swine Flu vaccine. Goldman Sachs, directed by Blankfein, was the largest shareholder in a deal they brokered in 2007 for the $15 billion sale of vaccine giant MedImmune that produces AstraZeneca's H1N1 "Flumist."

What's Next? The Expected Created "Big One?"

Flumist is the H1N1 nasal spray vaccine. People taking it spread the "live" "active" laboratory-engineered unstable virus for up to 3 weeks, putting non-vaccinated persons at risk of infection and worse. These "shed" unstable viruses more readily recombine with other circulating viruses; thus, potentially more severe outbreaks and far more deadly pandemics are now expected.

One such threat, a possible H1N1 hemorrhagic pneumonia recombinant, has emerged in the Ukraine, where the Chernobyl disaster occurred. The NATO superpower has fully engaged biological and chemical weapons research and development. This country was predicted to host a biological weapons release associated with H1N1 vaccines courtesy of the Baxter Corp around the time this outbreak occurred. Joseph Moshe, an Israeli Mossad agent, made this prediction on August 11, 2009, and his persecution and arrest made the national news.

Moshe attempted to warn US federal investigators and law enforcers about Baxter releasing a bioweapon as they had earlier this year "accidentally" shipping H5N1-contaminted seasonal flu vaccines to labs across Europe. Baxter previously shipped AIDS around the world in their HIV-contaminated blood product, heparin. This H1N1 vaccine supplier is among the least trustworthy companies in the world. Their adjuvanted vaccines are currently banned in the United States due to US Congressional condemnation, but favored by European nations. So much for consistency in vaccine science!

Here is the biggest problem. Unvaccinated persons are being vicariously "immunized" by simply going to school or work, contacting shedding H1N1 vaccinated carriers. Since more deadly viruses circulate in people, birds, animals, and the global environment, worse pandemics are predicted. Simply one "Typhoid Mary" transmitting an H1N1-H5N1 recombinant might depopulate millions of people

in many nations thanks to the H1N1 vaccinations! This is what experts and officials, in fact, expect to happen. It is the real grossly-neglected reason for the declaration of "National Emergency" by President Obama who, by the way, advanced the 2005 Senate bill to fund development of the H5N1 avian flu vaccine!

Murdoch and Blankfein's allied news sorcerer is Thomas H. Glocer, the Editor-in-Chief of Reuters News Service, who is also a member of the PFNYC. His directorship of Merck & Co, the world's largest vaccine maker, is another gross conflict of interest. Reuter's and Murdoch's News Corp. controls virtually all Western World propaganda, including the Associated Press which Murdoch directs as a board member. Murdoch and Glocer's media co-broke the story of Obama's H1N1 National Emergency declaration. Glocer broke the H1N1 Mexican Swine Flu news.

Let us not forget the conflicting interests of PFNYC member Mortimer Zuckerman, Editor-in-Chief of US News & World Report and the New York Daily News, who financed the American Lyme Disease Foundation that heavily promoted SmithKlein's disastrous Lymerix vaccine that tragically caused hundreds-of-thousands of casualties before the FDA suspended its use.

All the above are advancing massive media deception and human intoxication for population reduction through H1N1 recombinations spread by vaccinations, shedding, and reassorting with circulating viruses including, we now expect, hemorrhagic pneumonia from the Ukraine.

Concerned intelligent activists are demonized as "witches," holistic physicians are ostracized for practicing "witchcraft," and natural cures and immune boosters such as the **silver hydrosols** that could put Big Pharma out of business, are suppressed by officials of a murderous medical cult. Together, medical maniacs allied with media moguls have sewn the seeds for population reduction consistent with Population Counsel objectives and their own demise as humanity awakens to the catastrophe of this unfolding humanicide.

Dr. Leonard G. Horowitz is an award-winning author of 16 books and a Harvard-trained internationally recognized expert in public health and consumer protection. He views vaccinations as genocidal weapons for human intoxication and mass depopulation, and condemns gross criminal negligence and official malfeasance in the administration of the H1N1 Swine Flu "Scam." Go to FLUscam.com for more writings by Dr. Horowitz.

The original article by Goldberg is published here**.**

*The two most deadly myths in medical history is that: 1) vaccines, not mainly improvements in hygiene and nutrition, terminated polio and smallpox; and 2) vaccines are "safe and effective" when more than 90 percent of vaccine injuries and fatalities are criminally neglected, not surveyed nor reported.

**According to ScienceDaily.com: Approximately 75 percent of autoimmune diseases occur in women, most frequently during the childbearing years. These diseases also comprise a significant portion of chronic childhood disorders. Autoimmune disease refers to a group of more than 80 serious, chronic illnesses including diseases of the nervous, gastrointestinal, and endocrine systems as well as skin and other connective tissues, eyes, blood, and blood vessel. In all of these diseases, the underlying problem is similar--the body's immune system (including B and/or T immune cells) becomes misdirected, attacking the very organs it was designed to protect.

(http://www.sciencedaily.com/releases/2007/04/070403161855.htm)

Author's footnote: It is grossly idiotic and genocidal to neglect the diagnosis of general systemic vaccination intoxication then conjure up misdiagnoses requiring drug treatments. The best treatment, and public health measure, would obviously be to cease vaccinating and intoxicating people. Proof of this is adequately evidenced by the huge percentage of people with autoimmune diseases that even vaccine makers' package inserts warn about, eczema being a most prevalent one. This ignorance and neglect of what is obvious places the medical paradigm in jeopardy of crumbling due to iatrogenocidal stupidity.

Los Angeles Times

'V': The way of the gun

Los Angeles Times, 24 November 2009, 9 PM PT
https://www.latimes.com/archives/blogs/show-tracker/story/2009-11-24/v-the-way-of-the-gun

The pieces are coming together.

But, yes, you're going to have to wait until March to find out just what will happen next to our favorite reptilian aliens and the human resistance movement, now that the ABC sci-fi series goes into hiatus following tonight's episode.

The fall finale, entitled 'It's Only the Beginning,' served as a perfect wrap-up of the first act of 'V' and was just the thing to whet viewers' appetites for the nine remaining episodes of the first season of 'V.' In a perfect world, viewers would get the start of those episodes in January rather than March, but there's not much that can be done about that now, sadly.

The four episodes we've seen so far can therefore be looked at as an introduction to the narrative of 'V,' plus the writers gave us some payoffs to a number of plot threads while bringing in several new subplots to keep us turning over in our heads during the way-too-long hiatus.

This week's episode found the Fifth Column attempting to crack down on a potential biological threat against the humans as Tyler cuddled his way closer to Lisa while being ignored by his mother, Valerie sought salvation from her heartache at a Visitor healing center, Georgie got trigger happy, Father Jack showed off his right hook, Chad was faced with a dilemma once more, and Anna bestowed bliss upon her people.

…

And what did you make of the final shot of the episode, in which we see that the 29 Visitor ships floating above the Earth's cities aren't quite as alone as they want the humans to believe, given that there are about 100 other ships heading towards Earth? And what will happen when 'V' comes back in March? Head to the comments section to discuss

Paul Joseph Watson

ABC's V Series Plays on Vaccine Fears

Plot features alien conspiracy to inject humans with biological weapon disguised as flu shot

Prison Planet, 25 November 2009.

https://web.archive.org/web/20091128104101/http://www.prisonplanet.com/abcs-v-series-plays-on-vaccine-fears.html

Art imitating life or revelation of the method? ABC's popular remake of the 1980's drama "V" called a hiatus on its first season this week with an interesting plot – a conspiracy on behalf of the evil alien rulers to inject humans with a biological weapon disguised as a flu vaccine.

"The resistance uncovered a Visitor plot to inject the humans with a strange chemical compound," summarizes an LA Times write-up of the latest episode.

"Mistakenly believing that the vitamin supplement that Anna announces on television is the likely target of Peter Combs' plot (it is said to fight cancer and even stave off aging), Erica, Jack and Ryan make a shocking discovery at a warehouse that is even more insidious. Uncovering evidence of experimentation on human subjects, they soon realize that the vitamin supplements are smokescreen to divert attention from the real threat: the flu vaccine. The warehouse is overflowing with vaccine that has been tampered with and is intended to be shipped the following day."

Or as another write-up describes it, "Erica, Ryan, Georgie and Father Jack spent some time getting to know each other in this episode. Their plan is to expose the V's for what they are and they start with trying to crack down on their new Healthcare initiative. Long story short, they invade a warehouse and find out that the V's have been experimenting with some drugs on humans and killing them. They are planning to distribute their lethal injections by mixing it with Flu Vaccines. Erica realizes that Anna is exploiting the predictability of humans knowing that any health scare will cause them to get their flu shots in mass numbers."

The fact that script writers of such a major prime time show chose to run with this particular a plot at the same time as governments in the real-world attempt to overcome mass rejection of the swine flu shot due to fears over its safety is a fascinating synthesis.

As we have highlighted, health authorities have been desperately pushing the notion that the vaccine is safe as part of a gargantuan PR campaign, without explaining why well-connected members of the elite have had special access to an additive-free version of the shot that doesn't contain ingredients like mercury and squalene that are contained in the public version.

The rollout of the vaccine has been limited to far fewer people than the government originally intended, partly due to a supply shortage and partly because more than half of Americans have refused to take the shot. The government's efforts to dismiss concerns about side-effects will likely kick into high gear when more batches of the vaccine become available.

We know for a fact that government propaganda and talking points are inserted into popular TV shows on a routine basis, but could entire plots be constructed around such an agenda?

Some cynics would even suggest that the "V" scriptwriters playing on the vaccine meme is an exercise in revelation of the method, in the vein of the Lone Gunmen episode aired six months before 9/11 that featured a storyline about rogue elements within the government crashing a commercial plane into the World Trade Center by remote control in order to launch a new war in the middle east.

Watch a trailer clip for the V episode below.

Sorcha Faal

US Swine Flu spray plane shot down in China

SIASAT, 1 December 2009
https://www.siasat.pk/threads/us-swine-flu-spray-plane-shot-down-in-china-must-read.28519/

Reports circulating in the Kremlin today are stating that a US government contracted airplane piloted by American CIA agents and carrying a cargo of a mutated swine flu virus intended for aerial spraying was shot down [photo top left] at Chinas Shanghai Pudong airport by a saboteur team of what are believed to be Israeli Mossad soldiers seeking to prevent an American attack upon one of their Central Asian bases located in the Central Asian Nation of Kyrgyzstan.

According to Chinese media reports on this incident the stricken Zimbabwean MD-ll plane, owned by the CIA linked Avient Aviation company operated by a former British military officer named Andrew Smith and registered in the UK, killed 3 American CIA agents and injured 4 other personal who are reported to be from United States, Indonesia, Belgium and Zimbabwe.

Most interesting to note in these reports on the victims of this plane shootdown is that the Indonesian man currently being treated for his injuries has confessed to Chinese secret police forces that he is a technician employed by the United States Navy at their mysterious Naval Medical Research Unit No. 2 (NAMRU-2) located in Indonesia that Indonesian Defense Minister Juwono Sudarsono had previously called for the closing of because its operations were too secretive and were incompatible with Indonesias security interests.

Even more interesting to note about this US Navy secret bio-weapons base in Indonesia (the Worlds largest Muslim Nation) was its establishment in cooperation with the Rockefeller Institute, especially with it being the main center for the Americans Viral Diseases Program (VDP) they describe as the research of epidemiologic and laboratory research on viral hemorrhagic fevers, influenza, encephalitis, and rickettsioses and the head of this institute, David Rockefeller, long calling for a massive reduction in our Worlds population.

And to the agenda currently underway to radically change our World through the mass death of its population we need look no further for its explanation than David Rockefellers own words he spoke before the secretive Trilateral Commission in June, 1991, when he said:

We are grateful to The Washington Post, The New York Times, Time Magazine and other great publications whose directors have attended our meetings and respected their promises of discretion for almost forty years. It would have been impossible for us to develop our plan for the world if we had been subject to the bright lights of publicity during those years. But, the work is now much more sophisticated and prepared to march towards a world government. The supranational sovereignty of an intellectual elite and world bankers is surely preferable to the national auto determination practiced in past centuries.

To the United States employing planes to spread a mutated swine flu virus around the World we have further reports from China, and as we can read:

June 26 Suspicious aircrafts were forced to land. A US operated AN-124 changed its call sign from civillian to military which then triggered a response from the IAF upon entering Pakistani air space, the plane was forced to land in Mumbai while the second one was forced down by Nigerian figther jets that also arrested the crew.

According to reports China (Chinas Peoples Liberation Army Air Force) contacted the Indian and Nigerian intelligence officials about the presence of these US operated Ukranian aircrafts amidst growing concern that the United States were spreading biological agents in the Earths atmosphere also which some Chinese officals believed to be a attempt to mass genocide via the spread of h1n1 swine flu.

The strange thing about these reports and arrests as well as the forcing down of the planes were that these aircrafts were carrying waste disposal systems that could spray up to 45000kg or 100pounds of aerial type mist from sophisticated network of nano pipes that led throughout the trailing edges of the wings thereby dispersing whatever was in these tanks through a mist.

Reports of these US planes over Ukraine have been reported as well, and as we can further read:

Authorities in the town of Kiev, Ukraine denied any spraying of aerosolized medication by aircraft over the city. This after it was reported that light aircrafts were seen flying over the forest market area that sprayed a aerosol substance to fight h1n1 or swine flu.

5 Sources confirms this and the local newspapers of Kiev also received hundreds of phone calls from residents and business owners close to the area the planes were spraying the suspicious substance. Not only that but local businesses and retailers were advised to stay indoors during the day by the local authorities.

As if that is not enough, the government authorities also pushed the radio stations in Kiev to deny the reports. Online on forums, websites and blogs reports came in about eye witness accounts that confirms this. There was also reports of helicopters spraying aerosols over Kiev, Lviv, Ternopil and throughout Ukraine.

Most disturbing of the effects of the spraying of this mutated swine flu virus over the Ukraine is the devastating toll it has taken on the people of that country, and as we can read:

Almost 40 000 people got infected since yesterday in the Ukraine by what we still call the Ukraine plague but doctors have said recently that this is a stronger case of h1n1 or swine flu that has mutated and has that affect on the lungs where it destroys the lungs and fills it with blood.

But, to the most horrible outcome of this mutated swine flu virus is the World Health Organization now reporting that it is killing people in France, Norway, Brazil, China, Japan, Mexico, Ukraine, and the United States as the death toll from this Global Pandemic is now reported to be nearing 8,000 and China now reporting that this deadly disease has now crossed over into dogs.

Important to also note in these reports is that the US spray plane shot down in China was reported to be targeting a secret Israeli base located in the Central Asian Nation of Kyrgyzstan, which many Ashkenazi Jews (Ashkenazi Jews make up approximately 80% of Jews Worldwide) consider their spiritual homeland after their long exile their under Soviet Communist rule, and where Russian Intelligence Analysts report the Israelis are nearing the end of their decades long deciphering of the ancient Epic of Manas manuscript (with close to half a million lines the Epic of Manas is twenty times longer than Homers Odyssey and Iliad combined) that they believe contains our Worlds oldest warning to our present age and which (coincidentally?) agrees with the ancient Mayan peoples that the year of 2012 will see the ending of our present age.

To the final outcome of these events it is not in our knowing; other than to state the obvious, that the truths of these things are continued to be ignored, even scoffed at, by the very people whose extermination has been longed planned by these monsters and is now being carried out, and who still have no idea whatsoever how truly easy it has become for them to be controlled by their propaganda masters.

One can only hope that they awaken before all is lost for them, the facts suggest they wont.

The Telegraph

Row over ad on cancer vaccine

The Telegraph, 25 December 2009
https://www.telegraphindia.com/india/row-over-ad-on-cancer-vaccine/cid/564500

New Delhi, Dec. 24: India's apex drug regulatory agency has threatened action against a pharmaceutical company whose advertisement saying a vaccine can prevent cervical cancer has triggered indignation in some medical circles.

The Central Drugs Standards Control Organisation has sent a showcause notice to GlaxoSmithKline (GSK) India, which issued the advertisement, the regulatory body's officials said today.

The company markets a vaccine that has been shown to protect women from the sexually transmitted human papilloma virus (HPV), which has long been implicated in cervical cancer. GSK has labelled its advertisement a "public awareness initiative".

But a senior researcher who has investigated the biology of cervical cancer and some doctors are arguing that the advertisement appears to oversimplify the complexity of cervical cancer and could mislead consumers.

Sources in the regulatory body said the content of the advertisement, which has appeared in publications in several cities, appears to violate a section of the Drugs and Cosmetics Act under which no prevention claim can be made about cancer.

"We think that there has been a non-compliance with existing rules – so we have asked for an explanation and are now awaiting a response," an official said, requesting anonymity.

A GSK India spokesperson told The Telegraph: "I can confirm that we have received a showcause notice regarding our disease awareness campaign on cervical cancer. We are in the process of responding."

Ideally, the vaccines are administered to girls during adolescence. Over the past year, paediatricians in cities across India have been urging parents of girls heading into their teens to consider the vaccine against cervical cancer.

The company declined to respond today to questions raised by sections of doctors who have argued the advertisement that they have seen does not provide certain relevant information that could help consumers make an informed decision.

"There are several types of HPV- and the vaccines available today have not been proved to be effective against all the HPV types that appear associated with the high risk of cervical cancer," said Bhudev Chandra Das, former director of the Institute of Cytology and Preventive Oncology and now a professor of biomedical research at Delhi University.

The available vaccines protect against two types of HPV that seem to account for 80 to 90 per cent of cervical cancer. But, Das said, studies in the past have detected at least 10 other high-risk HPV types in India.

Researchers also point out that the protection from HPV need not always translate into protection from cancer.

"The vaccine is usually administered during adolescent years, and cervical cancer typically shows up after the 40s. The vaccines have been in the market for less than a decade – we'll need to wait for several more years to conclusively demonstrate protection from cancer," Das said.

A senior pathologist in Bangalore said the "public awareness campaign" had also failed to reveal that HPV was a sexually transmitted virus and the risk of picking up the virus increased with multiple sexual partners.

Studies during the 1970s through 1990s by the Indian Council of Medical Research had indicated that the risk of HPV and cervical cancer was highest in India among lower socio-economic groups.

"The vaccine costs a few thousand rupees, and those women who are at the highest risk are unlikely to be able to afford the vaccine," said Lt Gen Dasarathy Raghunath at the Sri Dorabji Tata Trust Centre for Tropical Diseases, Bangalore.

INDIA TODAY

Ritu Bhatia

Vaccine no guarantee against cervical cancer

India Today, New Delhi, 29 December 2009, 11:08 IST
https://www.indiatoday.in/good-health/health-buzz/story/vaccine-no-guarantee-against-cervical-cancer-63927-2009-12-28

Women's groups and doctors slammed advertisements issued by two pharmaceutical majors that claimed vaccination against human papilloma virus (HPV) was the best way of preventing cervical cancer.

Women's groups and doctors slammed advertisements issued by two pharmaceutical majors that claimed vaccination against human papilloma virus (HPV) was the best way of preventing cervical cancer.

The objection from Sama Resource Centre for Women and Health and Saheli Women's Resource Centre to Glaxo-SmithKline (GSK) India and Merck marketing HPV vaccines as a "protection against cervical cancer" comes a few days after the Central Drugs Standards Control Organisation (CDSCO) also took notice of the advertisements.

In a showcause notice issued to GSK India, the CDSCO cited objections raised by experts who said that the advertisements claiming that a vaccine can prevent cervical cancer were inaccurate and misleading. According to doctors, the drug majors appear to have oversimplified the complexity of cervical cancer and this could mislead consumers.

Researchers also point out that protection from HPV need not always translate into protection from cancer. "The vaccination doesn't always protect women from cervical cancer because this virus isn't the only cause of cervical cancer," said Dr Sidharth Sahni, a surgical oncology consultant at Artemis Health Institute.

The available HPV vaccines protect against only two types of viruses associated with cervical cancer. "There are several types of HPVs associated with cervical cancer, and vaccines have not been proved to be effective against all of them," said Bhudev Chandra Das, former director of the Institute of Cytology and Preventive Oncology and now a professor of biomedical research at Delhi University.

Ideally, the HPV vaccine should be administered to adolescent girls. Over the past year, paediatricians across the country have been urging parents of teenagers to administer them this vaccine.

But what many fail to mention is that this should only be given to those who have had no sexual exposure. "We first need to identify the target group for this vaccination," Sahni added.

Vani Subramaniam of Saheli said the pharmaceutical companies were hiding information about the side effects of the vaccines. According to Anjali Shenoy of Sama, the health lobby should concentrate more on increasing awareness on screening the cancer rather than its vaccines.

Mike Adams

2009 in review: A year of FDA censorship, Big Pharma crimes and celebrity drug deaths

Natural News, 1 January 2010
https://web.archive.org/web/20100323215213/http://www.infowars.com/2009-in-review-a-year-of-fda-censorship-big-pharma-crimes-and-celebrity-drug-deaths/

2009 has been a crazy year for health and medicine. It was the year that Congress rammed through a mandatory health "reform" bill that violates the U.S. Constitution in forcing all Americans to buy government-mandated products and services from greedy corporations. Although it hasn't been signed into law yet, the very fact that it has been passed by both the House and the Senate is alarming: America is just one signature away from becoming a medical dictatorship.

But that's not the only big health news that happened in 2009. In all, 2009 was a year of corruption, scientific fraud and health freedom oppression. Here are some of the highlights:

The FDA

The FDA was hit hard in 2009 was accusations of corruption and criminal behavior. In January, the FDA's own scientists accused management of committing crimes. => Adams M. FDA Scientists Accuse own Administration of Corruption, Intimidation and Scientific Censorship. Natural News, 12 January 2009; https://web.archive.org/web/20100209065935/http://www.naturalnews.com/025298_the_FDA_FDA_scientists_NaturalNews.html

And in August, the FDA abandoned even the appearance of standing up for safety by declaring that mercury fillings are safe for everyone.

=> Adams M. FDA declares Mercury Amalgam fillings safe for all. 11 August 2009; https://web.archive.org/web/20100210043018/http://www.naturalnews.com/026822_mercury_the_FDA_mercury_fillings.html

In order to protect its authority and boost Big Pharma's sales, the FDA also went after numerous natural health companies in 2009. Stephen Heuer was arrested by the FDA in January, and by June, the FDA had threatened to seize all natural products that boost immune health and protect against the swine flu.

=> Adams M. Chrysalis Nutritionist Stephen Heuer Arrested by Federal Marshalls in FDA Raid. 16 January 2009; https://web.archive.org/web/20100215164700/http://www.naturalnews.com/025347_nutrition_the_FDA_health.html

=> Adams M. FDA Threatens to seize all Natural Products that dare to Mention H1N1 Swine Flu. - 18 June 2009; https://web.archive.org/web/20100209064535/http://www.naturalnews.com/026473_the_FDA_H1N1_natural_products.html

The FTC also joined the tyranny bandwagon, engaged in a war of threatening tactics against a ministry selling anti-cancer herbs and ultimately ordering them to lie to their customers about their products. Tyrannical FTC Threatens Christian Church with Imprisonment for Selling Dietary Supplements. – 13 January 2009; https://web.archive.org/web/20100209112321/http://www.naturalnews.com/025303_the_FTC_health_dietary_supplement.html
FTC orders Daniel Chapter One to lie to customers about cancer remedies; ministry defends health freedom. - 3 September 2009; https://web.archive.org/web/20100209142018/http://www.naturalnews.com/026970_the_FTC_freedom_cancer.html

The FTC even went after Dr. Weil, threatening him with arrest and imprisonment for daring to accurately describe the immune boosting effects of the astragalus herb.

Adams M. FDA, FTC threaten Dr. Weil over immune-boosting supplements for H1N1 swine flu. – 22 October 2009 https://web.archive.org/web/20100210045026/http://www.naturalnews.com/027303_the_FTC_America_vaccines.html

Topping off the year of tyranny and oppression, in December the FDA staged an illegal kidnapping of herbal formulator Greg Caton who was threatening the cancer industry with his anti-cancer salve products made from Ecuadorian herbs. Adams M. FDA dupes Interpol to achieve illegal kidnapping and deportation of herbal formulator Greg Caton. – 16 December 2009;
https://web.archive.org/web/20100209063309/http://www.naturalnews.com/027750_Greg_Caton_FDA.html

Big Pharma corruption

2009 was also a bad year for Big Pharma. All kinds of new findings came out that show the dangers of pharmaceuticals. For example, did you know that HRT drugs shrink women's brains?

Feature articles on pharmaceuticals & Feature articles on drugs:
https://web.archive.org/web/20091231043303/http://naturalnews.com/*pharmaceuticals*.html
https://web.archive.org/web/20100213053527/http://www.naturalnews.com/*drugs*.html

https://web.archive.org/web/20100210044415/http://www.naturalnews.com/025354_drugs_HRT_HRT_drugs.html

The drug industry was also shown to be engaged in blatant scientific fraud.
=> https://web.archive.org/web/20100323114629/http://www.naturalnews.com/fraud.html

AstraZeneca, for starters, taught its sales reps how to lie to doctors, and throughout the pharmaceutical industry, many clinical trials were exposed as being entirely fraudulent.=> AstraZeneca suppressed Information about Seroquel link to Diabetes, told Sales Reps to Lie. – Natural News, 27 February 2009

Feature articles on pharmaceutical industry:
https://web.archive.org/web/20100213054509/http://www.naturalnews.com/pharmaceutical_industry.html

On the researcher side, Big Pharma scientist Dr. Scott Reuben was caught fabricating 21 studies – most of which were widely quoted by other doctors to push dangerous pills onto children.
Adams M. A Listing of the Twenty-One Fabricated Studies by Dr. Scott Reuben. – Natural News, 15 March 2009
https://web.archive.org/web/20100209160428/http://www.naturalnews.com/025852_anesthesia_drugs_medical_journals.html

Also in 2009, Pfizer actually admitted to committing felony crimes over its marketing of Bextra
Pfizer pleads guilty to felony crime in fraudulent marketing of Bextra, pays billions in fines. - 2 September 2009;
https://web.archive.org/web/20100209160428/http://www.naturalnews.com/025852_anesthesia_drugs_medical_journals.html

Merck was found to have created a "hit list" of doctors targeted for destruction – doctors who were speaking out against the safety of the company's drugs. Adams M. Merck employees had "hit list" of doctors they sought to "neutralize", court documents reveal. – Natural News, 28 September 2009.
https://web.archive.org/web/20100210024355/http://www.naturalnews.com/027116_Merck_doctors_vaccines.html

The company was also busted over its hiding of data about the dangers of Vioxx. => Adams M. Merck's Vioxx scandal widens: Drug maker knew Vioxx was deadly for years before risk was made public. - 25 November 2009
https://web.archive.org/web/20100210013539/http://www.naturalnews.com/027582_Merck_Vioxx.html
https://web.archive.org/web/20100310084213/http://www.naturalnews.com/dangers.html

Not to be out-frauded by Merck, Pfizer paid a record $1.3 billion fine in 2009 for intentionally misbranding its drugs. Feature articles on Merck: https://web.archive.org/web/20100205081509/http://naturalnews.com/Merck.html
Adams M. Pfizer to pay $1.3 billion criminal fine for misbranding its drugs. – Natural News, 19 October 2009
https://web.archive.org/web/20100209160249/http://www.naturalnews.com/027276_Pfizer_drugs_the_FDA.html

Similarly, the Dept. of Health and Human Services was caught backing a medical device "review board" that was actually led by a dead dog. => Adams M. Department of Health and Human Services Approves Fictitious Medical Device Review Board Led by a Dead Dog. – The Flu Case, 29 March 2009
https://web.archive.org/web/20100209135546/http://www.naturalnews.com/025955_health_America_medical_devices.html

Deadly Merck vaccines
On the vaccine front, Merck was under extreme fire for its Gardasil cervical cancer vaccines.
We promoted a petition to investigate Gardasil-related deaths (http://www.naturalnews.com/025646_G…),
and we published stories about young girls who died after receiving Merck vaccines (http://www.naturalnews.com/027151_c…).
One girl suffered permanent brain damage after a Gardasil injection (http://www.naturalnews.com/027188_N…).

In October, 2009, a top Gardasil researcher went public with information warning about the dangers of the vaccine (http://www.naturalnews.com/027196_c…), but she immediately retracted her story after being pressured by… guess who?

By the end of 2009, it was revealed that long-time head of the CDC, Dr. Julie Gerberding, had been in discussions with Merck about taking the job of president of Merck's vaccine division. She soon accepted that job and now works at Merck. (http://www.naturalnews.com/027789_D…)

This leap of such a high-profile government executive to a top position in Big Pharma underscored the ongoing "revolving door" between industry and government.

Making the vaccine topic even more convoluted in 2009, Baxter shipped vaccines materials containing live avian flu virus to 18 countries (http://www.naturalnews.com/025760_B…).

New information came out in 2009 about the link between **autism** and vaccines (http://www.naturalnews.com/027178_v…), and autism rates continued to skyrocket even while the conventional scientific community denied any and all links to pharmaceuticals or vaccines (http://www.naturalnews.com/027175_v…).

Big Pharma destroys the environment

Big Pharma was also caught destroying the environment throughout 2009. In India, for example, drug companies were caught dumping toxic pharmaceuticals into rivers (http://www.naturalnews.com/025415_w…).

Not surprisingly, lots of studies published in 2009 revealed that *fish are contaminated with pharmaceutical chemicals* (http://www.naturalnews.com/025933_p…).

Pharmaceuticals are even contaminated with chemicals themselves, we discovered. Some medications, for example, contain phthalates that "feminize" young boys (http://www.naturalnews.com/027514_p…).

Psych drugs and shootings

The psych drug industry received yet more bad news in 2009 as its drugs were shown to be even more dangerous than previously thought. ADHD drugs, in particular, were found to cause all sorts of bizarre side effects including making children hallucinate (http://www.naturalnews.com/025433_d…). Speaking of children, the FDA went out of its way to actually approve antipsychotic drugs for children (http://www.naturalnews.com/026429_h…), opening the doors to even more mass drugging of our nation's youth.

Thanks to the psych drug industry, there were of course more shootings in 2009 (http://www.naturalnews.com/025826_a…) and more sudden deaths from Ritalin (http://www.naturalnews.com/026459_a…). Both the Orlando and the Ft. Hood shooters were also linked to psychiatric drugs (http://www.naturalnews.com/027425_d…).

Food dangers

2009 was also a huge year for findings about *the contamination of the food supply*. High Fructose Corn Syrup ("liquid Satan") was found to be contaminated with mercury (http://www.naturalnews.com/025442_m…), and "natural" soy protein was found to be bathed in toxic hexane solvents (http://www.naturalnews.com/026303_h…).

Infant formula was routinely found to be dangerous to infants, including a finding that infant formula was contaminated with hexane (http://www.naturalnews.com/026315_h…). It was also revealed in 2009 that the USDA openly allows e.coli-contaminated meat to be sold as hamburgers (http://www.naturalnews.com/027414_d…). (They can also legally be made with beef from cows that are fed chicken feces.)

Also in 2009, the "Smart Choices" food labeling gimmick was revealed as a total fraud (http://www.naturalnews.com/027077_n…), discrediting Tufts University and its hilarious nutritionist who thinks processed sugary cereals are good for you.

Celebrity news

On the celebrity side, in 2009 Michael Phelps got caught smoking a bong (http://www.naturalnews.com/025489_s…), Oprah stirred up trouble by recommending KFC chicken dinners (http://www.naturalnews.com/026234_O…), Michael Jackson was killed by FDA-approved pharmaceuticals (http://www.naturalnews.com/026511_c…), and Patrick Swayze was killed by chemotherapy (http://www.naturalnews.com/027030_c…).

Actress Brittany Murphy was killed by "acute pharmaceutical toxicity" after taking a lethal combination of FDA-approved prescription drugs that nobody thought to test in combination (http://www.naturalnews.com/027781_B…).

Dr. Mehmet Oz, a very visible vaccine promoter, was also scrutinized for his financial relationship with a vaccine technology company that hilariously denied having anything to do with vaccines (http://www.naturalnews.com/027451_D…). NaturalNews readers conducted research on the company in question (SIGA Technologies) and found a huge amount of evidence linking the company to vaccines (including patents). (http://www.naturalnews.com/027483_S…)

On the bright side, I was fortunate to be able to conduct interviews with several courageous, outspoken celebrities including Jane Goodall (http://www.naturalnews.com/027714_J…) and Suzanne Somers (http://www.naturalnews.com/027526_S…).

Health freedom

Health freedom was under a major assault this year as sellers of raw milk found themselves targeted in state-run sting operations (http://www.naturalnews.com/027675_r…).

In order to try to enhance health freedom, I worked with the Life Extension Foundation (and other groups) to create the *Health Revolution Petition* (www.HealthRevolutionPetition.org), which offers a freedom-based health care reform system that restores health freedom and even would help save America from financial destruction by sharply reducing sick-care costs. It has so far been signed by over 35,000 people.

The mammogram scam exposed

2009 was also a terrible year for the mammogram industry, which found itself unable to hide the truth about its "detection" scam any longer. The world learned that *mammograms cause cancer* and actually harm more women than they help. (http://www.naturalnews.com/027742_m…)

Suzanne Somers bravely spoke out in an exclusive NaturalNews interview where she told the full truth about the dangers of mammograms and the fraud of the cancer industry (http://www.naturalnews.com/027526_S…).

The cancer industry, not surprisingly, still refuses to answer the *21 questions* I posed in a widely-read article about the mammogram scam: http://www.naturalnews.com/027549_m…

The cancer industry was also pounded by new research showing that chemotherapy causes long-term neurological damage. (http://www.naturalnews.com/027600_c…)

Profiteering was a big theme in the cancer industry this year. One drug company announced it would start selling a new cancer drug that costs *$30,000 a month* (http://www.naturalnews.com/027705_c…).

CT scans and medical imaging procedures were also exposed in 2009 as Americans learned the truth about how dangerous they are to your health (http://www.naturalnews.com/025767_c…). It turns out that being subjected to multiple CT scans is a lot like standing in the blast radius of an atomic weapon (http://www.naturalnews.com/027648_C…).

Health care reform

The health care reform debate took a turn for the worse in 2009 as nutritionally illiterate lawmakers passed a health care reform bill that seemed designed to bankrupt America (http://www.naturalnews.com/026628_h…) and destroy U.S. jobs (http://www.naturalnews.com/026643_h…).

While there was lots of talk about how to reform health care, the entire debate turned out to be nothing but a scam to force Americans to buy into rip-off conventional medicine services and insurance scams. All the important conversations about real health care reform never took place (http://www.naturalnews.com/026887_h…).

The entire future of America looked rather bleak as accelerating national debt collided with increased sickness and disease. In assessing the situation, I published a widely-read article about the "New Mr. America" — diseased and bankrupt. (http://www.naturalnews.com/026693_d…)

Following that, I posted a highly popular special report called *Nutrition Can Save America!* in which I laid out a plan for saving America by unleashing the healing power of food and natural remedies across the population. (http://www.naturalnews.com/027569_n…)

AIDS myths exposed

2009 was also the year in which the AIDS myth was exposed by a breakthrough documentary called *House of Numbers* (http://www.naturalnews.com/027355_A…).

It turns out that conventional AIDS theories are based on complete hogwash, and all a person really needs to prevent AIDS is a strong, healthy immune system (http://www.naturalnews.com/027354_A…).

The legal front

In 2009, Big Pharma sought to win blanket immunity for all drugs, but the U.S. Supreme Court surprisingly shot down the idea (http://www.naturalnews.com/025778_S…).

Throughout 2009, the courts continued to order parents to poison their children with chemotherapy (http://www.naturalnews.com/026283_c…). Young cancer patient Daniel Hauser was poisoned (virtually at gunpoint) by chemotherapy doctors acting on court orders (http://www.naturalnews.com/026305_m…).

Technology and DRM

On the technology front, Amazon.com pulled a huge Big Brother event by remotely deleting copies of the book *1984* from users' Kindle devices. NaturalNews responded by calling for a boycott on the Kindle (http://www.naturalnews.com/026804_D…).

We've since learned that the Kindle's security has been hacked, allowing users to copy off all their Amazon Kindle books as PDF files (yet another victory for the hackers over Big Brother).

Subatomic physics and the search for the God particle

In the realm of **subatomic physics**, 2009 was the year that people really started talking about the new Large Hadron Collider (a supercollider) and the search for the *Higgs Boson* particle. I wrote several important commentary pieces on this topic, explaining why there's no such thing as a Higgs Boson "particle" (http://www.naturalnews.com/025486_H…),

Also in the realm of science, 2009 was the year that U.S. Navy researchers finally admitted that *cold fusion* is, indeed, quite real, reversing decades of denials about this "free" energy technology which has been suppressed since 1989 (http://www.naturalnews.com/025925_c…).

Wake up, people!

In 2009, I also tried to educate people about the linguistic trickery used by modern medicine (http://www.naturalnews.com/025396_d…), but this topic turned out to be far too advanced and not many people "got it." This led to the publication of a very popular article asking why smart people are so stupid when it comes to issues like vaccines, nutrition and vitamin D (http://www.naturalnews.com/026843_h…).

In an effort to try to share natural health knowledge with the world, I personally built and launched the world's largest online encyclopedia of quotes from natural health authors, called NaturalPedia (http://www.naturalnews.com/026902_N…).

Positive news

Also on the good side, our non-profit Consumer Wellness Center (www.ConsumerWellness.org) handed out numerous grants to schools and education centers around the world that invested the money in teaching children (and some adults) about gardening, self-care, healing foods and more. Here are links to some of the awards we gave out: http://www.naturalnews.com/025235_f…
http://www.naturalnews.com/025391_n…

And here are a few of the success stories from this grant effort: http://consumerwellness.org/GrantSu…

Natural remedies revealed in 2009

We covered lots of news about natural remedies in 2009. Here are just a few of the ones we published on NaturalNews.com:

- Grapeseed extract kills leukemia cancer cells http://www.naturalnews.com/025248_c…
- Vitamin D halts growth of breast cancer tumors (http://www.naturalnews.com/025495_c…)
- Blueberries lower cholesterol (http://www.naturalnews.com/025866_b…)
- Resveratrol prevents cancer and heart disease - http://www.naturalnews.com/025977_r…
- Astaxanthin is a natural anti-inflammatory nutrient - http://www.naturalnews.com/026325_a…
- Natural anti-viral remedies can protect you from swine flu - http://www.naturalnews.com/026378_a…
- Yellow pea protein lowers blood pressure - http://www.naturalnews.com/026406_b…
- Vitamin D lowers health care costs - http://www.naturalnews.com/026770_V…
- Selenium helps prevent cancer - http://www.naturalnews.com/027158_s…
- Cinnamon helps prevent diabetes - http://www.naturalnews.com/027168_c…
- Garlic treats high blood pressure - http://www.naturalnews.com/027195_g…
- Chaparral treats cancer - http://www.naturalnews.com/027247_c…
- Omega-3 oils beat depression - http://www.naturalnews.com/027285_o…
- Oregano oil eliminates parasites - http://www.naturalnews.com/027333_p…
- Magnesium prevents heart disease - http://www.naturalnews.com/027392_m…
- Cabbage stops stomach ulcers - http://www.naturalnews.com/027454_c…
- Acupuncture reverses infertility - http://www.naturalnews.com/027467_a…
- Colloidal silver works better than antibiotics - http://www.naturalnews.com/027474_c…
- Green tea prevents brain disorders - http://www.naturalnews.com/027757_g…

2009 in summary

Well, there you have it! Those are the highlights of what NaturalNews covered in 2009. It was a year of outrageous quackery, FDA tyranny, censorship and criminal acts on the part of the pharmaceutical industry.

At the same time, it was also a year when more people finally woke up to the dangers of mammograms and CT scans. NaturalNews readership climbed substantially through 2009 as more people got turned on to the truth about natural remedies and the healing power of nutrition.

The FDA and Big Pharma is now increasingly under fire as a result of the events of 2009, and I suspect that in 2010 and beyond, the pharmaceutical industry is going to find itself under increasing scrutiny as more and more of its criminal operations are exposed.

But don't expect the mainstream media to have anything to do with that. All the really smart reporting is now happening on blogs and independent news sites. The mainstream media continues to play its "Truman Show" game of broadcasting a fictional reality to the people, hoping no one will notice what's *really* going on.

Thank you for reading NaturalNews in 2009, and we have a lot more in store for you in 2010 and beyond! With your help, perhaps we can see some real breakthroughs in health freedom in 2010. One day, we might even get to witness the arrest and criminal prosecution of Big Pharma's top executives who are guilty of crimes against humanity for continuing to wage chemical warfare against the people (while poisoning the environment at the same time).

Stay tuned for more news from NaturalNews.com throughout 2010!

Hindustan Times @100

Now, 'nano cocktail' to target and kill tumours

Hindustan Times, 5 January 2010, at 05:05 PM IST
https://www.hindustantimes.com/health-and-fitness/now-nano-cocktail-to-target-and-kill-tumours/story-iUbWVomdcztgXKxmjbCFMM.html

Scientists have developed what they call a 'cocktail' of nano-sized particles that is capable of identifying and killing cancerous tumors, in a breakthrough study.

In a breakthrough study, scientists have developed what they call a 'cocktail' of nano-sized particles that is capable of identifying and killing cancerous tumours.

According to the team from California and Massachusetts, the "cocktail" works in concert within the bloodstream to locate, adhere to and destroy cancerous tumours.

"This study represents the first example of the benefits of employing a cooperative nanosystem to fight cancer," said Michael Sailor, a professor of chemistry and biochemistry at the University of California, San Diego and the primary author of a paper.

The researchers have developed a system containing two different nanomaterials the size of only a few nanometers, or a thousand times smaller than the diameter of a human hair, that can be injected into the bloodstream.

One nanomaterial was designed to find and adhere to tumours in mice, while the second nanomaterial was fabricated to kill those tumours.

"For example, a nanoparticle that is engineered to circulate through a cancer patient's body for a long period of time is more likely to encounter a tumour," said Sangeeta Bhatia, a physician, bioengineer and a professor of Health Sciences and Technology at the Koch Institute for Integrative Cancer Research at MIT and a co-author of the study.

"However, that nanoparticle may not be able to stick to tumour cells once it finds them. Likewise, a particle that is engineered to adhere tightly to tumours may not be able to circulate in the body long enough to encounter one in the first place," she added.

When a single drug does not work in a patient, a doctor will commonly administer a cocktail containing several drug molecules. That strategy can be very effective in the treatment of cancer, where the rationale is to attack the disease on as many fronts as possible.

The Accelerated Child Survival and Development programme in west Africa: a retrospective evaluation

Lancet, 11 January 2010 // 13 Feb 2010; 375(9714):572-82
doi: 10.1016/S0140-6736(09)62060-2.
https://www.thelancet.com/journals/lancet/article/PIIS0140-6736(09)62060-2/abstract

Background

UNICEF implemented the Accelerated Child Survival and Development (ACSD) programme in 11 west African countries between 2001 and 2005 to reduce child mortality by at least 25% by the end of 2006. We undertook a retrospective evaluation of the programme in Benin, Ghana, and Mali.

Methods

We used data from Demographic and Health Surveys and Multiple Indicator Cluster Surveys to compare changes in coverage for 14 ACSD interventions, nutritional status (stunting and wasting), and mortality in children younger than 5 years in the ACSD focus districts with those in the remainder of every country (comparison areas), after excluding major metropolitan areas.

Findings

Mortality in children younger than 5 years decreased in ACSD areas by 13% in Benin (absolute decrease 18 deaths per 1000 livebirths, p=0·12), 20% in Ghana (21 per 1000 livebirths, p=0·10), and 24% in Mali (63 per 1000 livebirths, p<0·0001), but these decreases were not greater than those in comparison areas in Benin (25%; absolute decrease 36 deaths per 1000 livebirths, p=0·15) or Mali (31%; 76 per 1000 livebirths, p=0·30; comparison data not available for Ghana). ACSD districts showed significantly greater increases than did comparison areas in coverage for preventive interventions delivered through outreach and campaign strategies in Ghana and Mali, but not Benin. Coverage in ACSD areas for correct treatment of childhood pneumonia, diarrhoea, and malaria did not differ significantly from before to after programme implementation in Benin and Mali, but decreased significantly in Ghana for malaria (from 78% to 53%, p<0·0001) and diarrhoea (from 39% to 28%, p=0·05). We recorded no significant improvements in nutritional status attributable to ACSD in the three countries.

Interpretation

The ACSD *project did not accelerate child survival* in Benin and Mali focus districts relative to comparison areas, probably because coverage for effective treatment interventions for malaria and pneumonia were not accelerated, causes of neonatal deaths and undernutrition were not addressed, and stock shortages of insecticide-treated nets restricted the potential effect of this intervention. Changes in policy and nationwide programme strengthening may have benefited from inputs by UNICEF and other partners, making an acceleration effect in the ACSD focus districts difficult to capture.

Arzneimittelkommission will mehr Transparenz bei Studien

Aerzteblatt, 11 Januar 2010
http://www.aerzteblatt.de/nachrichten/39606/Arzneimittelkommission_will_mehr_Transparenz_bei_Studien.htm

Berlin – Die Arzneimittelkommission der deutschen Ärzteschaft (AkdÄ) kritisiert die Informationspolitik der Arzneimittelforschung. „Wir brauchen dringend mehr Transparenz bei der Veröffentlichung klinischer Studien“, forderte der AkdÄ-Vorsitzende Wolf-Dieter Ludwig im Rahmen des Interdisziplinären Forums der Bundesärztekammer (BÄK) in Berlin.

Zu oft würden die Ergebnisse von der Pharmaindustrie zu spät bekannt oder überhaupt nicht publiziert. „Es ist deshalb richtig und wichtig, dass sich das Bundesgesundheitsministerium für eine schnelle Veröffentlichung von Studienergebnissen bei der Arzneimittelforschung einsetzen will“, sagte Ludwig.

Er warnte in diesem Zusammenhang auch davor, die Informationen zu häufig als vertraulich einzustufen und dadurch der Öffentlichkeit vorzuenthalten. Selbst bei bereits zugelassenen Medikamenten sei es für Ärzte und Patienten schwierig, verlässliche Informationen zu erhalten, so die Kritik.

Neben der Arzneimittelsicherheit rückt laut AkdÄ die Arzneimitteltherapiesicherheit immer stärker in den Blickpunkt der Gesundheitsberufe und der Öffentlichkeit. „Wechselnde Behandlungsteams und das hektische Umfeld einer akuten Krankenversorgung können dazu führen, dass ohne gezielte Maßnahmen eine hohe Versorgungsqualität nicht zu gewährleisten ist“, erklärte Walter Emil Haefeli vom Universitätsklinikum Heidelberg.

Bei der Fehleranalyse hätten sich in der Vergangenheit elektronische Hilfsmittel bewährt, mit denen etwa Überdosierungen oder unerwünschte Wechselwirkungen vermieden werden sollen. Diese Systeme müssten aber zunächst im Alltag getestet werden, weil andernfalls durch deren Nutzung neue Fehler verursacht werden könnten, warnte Haefeli

THE FLU CASE

German Drug Regulator Criticises Lack of Transparency with Big Pharma Studies

The Flu Case, 12 January 2010 10:43
https://web.archive.org/web/20100220012427/http://www.theflucase.com/index.php?option=com_content&view=article&id=2545%3Agerman-drug-regulator-criticises-lack-of-transparency-with-big-pharma-studies&catid=1%3Alatest-news&Itemid=64&lang=en

The head of the Drug Commission of the German Medical Association Wolf-Dieter Ludwig has said that "more transparency with the publication of clinical studies" is "urgently" required, reports the Ärtzeblatt.

Ludwig said that the result of studies by pharmaceutical companies were published too late or not at all too often, and that a lack of adequate information could undermine effective health care.

THE FLU CASE

Brian Dodds

Protocols for vaccine approval

The Flu Case, 12 January 2010
https://web.archive.org/web/20100220012406/http://www.theflucase.com/index.php?option=com_content&view=article&id=2539%3Aprotocols-for-vaccine-approval-by-brian-dodds&catid=1%3Alatest-news&Itemid=64&lang=en

It needs to be understood that the protocol for deciding a vaccine is 'safe' is different from the protocols of deciding a vaccine is 'unsafe'.

'Clinical', and I repeat 'clinical' trials are undertaken for any vaccine proposed for administration to the general public. Clinical trials means that the vaccine is administered to a number of people and the side-effects are documented. If the side-effects are considered to be within the acceptable limit, the drug or vaccine is approved for general use.

In the case of severe reactions or even death from a drug or vaccine, one could say that under the protocol of clinical results, the SIDE-EFFECTS were shown to be UNACCEPTABLE.

However this protocol is not accepted by the medical authorities. The medical authorities require it to be 'scientifically' proven that the vaccine caused the person's demise.

Nobody can ‘scientifically’ prove a vaccine caused a certain reaction or even death, just the same as nobody can 'scientifically', prove that a drug or vaccine is safe.

Even though compensation is often paid out when large amounts of adverse reactions to a

vaccine or drug are documented, it is only in cases like 'thalidomide' where the evidence is so overwhelming that the drug companies were forced to take responsibility and admit the drug was the cause.

We need to demand that an inquiry be made into these discrepancies in the medical system.

NEWS BBC

UN child-death campaign 'failed'

BBC News, 13 January 2010 12:57
http://news.bbc.co.uk/2/hi/africa/8455444.stm

A UN programme to combat child deaths from disease in West Africa has failed, a Johns Hopkins University study says.

Unicef spent $27m (£17m) rolling out vaccinations, vitamin A pills and bed nets to protect against malaria from 2001 to 2005 in areas of 11 countries.

The researchers studied parts of Ghana, Mali and Benin and said children often survived better outside the UN scheme.

Unicef said the programme succeeded in raising standards of care across whole countries, not just in target areas.

Jennifer Bryce, of the Johns Hopkins Bloomberg School of Public Health, told the BBC's Focus on Africa there had been "too many missed opportunities to save children's lives".

"The lives of many children with pneumonia, diarrhoea or malaria could have been saved if a trained community health worker had been on hand to provide correct treatment," she said.

"But instead what we found was there were few gains [in the areas covered by Unicef] for providing treatment for these diseases - and some losses."

'Success, not failure'

The study, published in the British medical journal Lancet, claimed that child deaths fell by 13% in areas of Benin targeted by Unicef.

But in areas of the country where the programme was not introduced, the death rate dropped by almost 25%.

In Mali the researchers found death rates fell by 24% in districts where the Unicef programme was set up, *but 31% elsewhere in the country*.

The UN agency's Mickey Chopra told the BBC it was a misinterpretation to say the programme had failed.

"The programme always was about encouraging governments... to put these interventions in place all over the country," he said.

"And we showed that coverage of things like vaccinations, vitamin A pills and bed nets did increase all over the countries after the programme had started.

"So the fact that we succeeded in increasing coverage of these interventions across the whole country – which in turn meant that the whole country showed improvement – is a success of the programme not a failure."

Unicef's aim was to reduce the death rate by at least 25% by the end of 2006.

Research Fraud Probe Leads to Criminal Charge

MedPage Today, 15 January 2010
http://www.medpagetoday.com/PublicHealthPolicy/Ethics/17985

Massachusetts anesthesiologist accused of fabricating data in studies of pain drugs will plead guilty to federal criminal charges under an agreement with prosecutors.

Scott Reuben, MD, a well-known pain researcher at Baystate Medical Center in Springfield, Mass., was charged with one count of healthcare fraud.

Early last year, the hospital announced that an internal audit had revealed that Reuben had made up research data out of whole cloth, affecting at least 21 published studies over a 15-year period.

The criminal charge arose from one of those studies, funded by Pfizer and published in Anesthesia & Analgesia in 2007.

According to the U.S. Attorney's office in Boston, Pfizer had given some $74,000 to Reuben for a placebo-controlled study of celecoxib (Celebrex) as part of a "multimodal" painkiller regimen for outpatient knee ligament surgery. The study was to enroll 100 patients.

Reuben subsequently reported to Pfizer and in the journal article that 200 patients entered the trial and that the celecoxib regimen was effective.

"In fact, Reuben had not enrolled any patients into that study, and the results reported both to Pfizer and to Anesthesia & Analgesia and, in turn, to the public were wholly made up by Reuben and therefore false," prosecutors wrote in a court filing.

Reuben could receive up to 10 years of jail time, to be followed by three years of supervised release and a $250,000 fine, but prosecutors agreed in the plea deal to recommend penalties at the low end of the range allowed in sentencing guidelines.

The agreement also requires Reuben to pay a total of about $362,000 in restitution to Pfizer and other pharmaceutical companies, plus $55,000 in fines and forfeitures.

Last year, after Baystate announced its findings on Reuben, the 21 articles it identified as tainted were retracted by the journals publishing them.

The National Library of Medicine's PubMed system lists more than 70 articles published since 1991 with Reuben as an author. The 21 retracted articles all listed Reuben as first author.

The editor of one journal that had published Reuben's research, Regional Anesthesia and Pain Medicine, contacted other investigators on six studies in which Reuben was a secondary author.

They all attested to the truthfulness of the reported data, according to the journal editor, Joseph M. Neal, MD. The journal ended up retracting only the one paper which had Reuben as lead author.

Reuben's contract with Baystate was terminated last March, at which time he reportedly also agreed with the state's medical board to voluntarily withdraw from practice.

The Day

Lee Howard

Former Pfizer representative charged with health care fraud

The Day, 15 January 2010, 12:00 AM
https://www.theday.com/local-news/20100114/former-pfizer-representative-charged-with-health-care-fraud/

Dr. Scott S. Reuben, a former member of Pfizer Inc.'s speakers' bureau accused last year of perpetrating one of the biggest research frauds in medical history, was charged today in a federal court in Boston with falsifying medical research studies.

Reuben, formerly chief of acute pain at Baystate Medical Center in Springfield, Mass., faces up to 10 years in prison and a $250,000 fine.

U.S. Attorney Carmen M. Ortiz accused Reuben of accepting a $75,000 grant from Pfizer to research the effectiveness of pain medication Celebrex for a 2005 study in which no patients were actually enrolled. Prosecutors allege that Reuben made up the data, which he subsequently published in the medical journal "Anesthesia & Analgesia."

The data supported the conclusion that Celebrex was effective in helping post-operative patients who had received a particular type of knee surgery on the anterior cruciate ligament. "Anesthesia & Analgesia" later had to retract 10 papers written by Reuben, and medical experts at the time said at least 21 journal articles by the anesthesiologist appeared to be fabricated.

Reuben's studies had been considered pioneering at the time they were published. His data had supported the use of two of Pfizer's major products — Celebrex and Lyrica — in combination to treat certain types of post-operative pain.

Pfizer said it had supported five of Reuben's research initiatives. Pfizer, which declined at the time to reveal how much it paid Reuben over the years to be part of its speakers' bureau, said the company played no part in the fraud.

Last March, Reuben was dismissed from his position at Baystate Medical Center after an audit revealed he had been inventing data for as many as 13 years.

Age of Autism

False Testimony Denies Lancet Doctors a Fair Hearing

Age of Autism, 27 January 2010
https://www.ageofautism.com/2010/01/-false-testimony-denies-lancet-doctors-a-fair-hearing.html#more

(27 January, London) A First Amended Complaint on behalf of 21 US and UK autism and vaccine safety advocacy organizations against Drs. Horton, Salisbury, Zuckerman, Pegg, and Rutter alleging, inter alia, that they gave false statements and testimony as prosecution witnesses in the proceeding brought by the General Medical Council (GMC) has been filed today. The false testimony on the two core issues (alleged conflicts of interest and unethical research) has irrevocably corrupted the proceeding against Drs. Wakefield, Walker-Smith, and Murch, and deprived them of a fair hearing. The objective documentary evidence demonstrates that Dr. Wakefield did not have a disclosable financial conflict; that Dr. Horton (Lancet Editor) was well aware of Dr. Wakefield's participation in MMR litigation, suppressed that knowledge from the public, and then feigned surprise six years later in order to shift "blame' for publication of the controversial article to Dr. Wakefield; and that the Ethics Committee had approved the taking of additional biopsies by colonoscopy well before any of the 12 Lancet children were examined. We call upon the GMC to immediately dismiss the complaints against Dr. Wakefield, Walker-Smith, and Murch and begin an appropriate investigation against Drs. Horton, Zuckerman, Salisbury, Pegg, and Rutter.

Summary of the Allegations in the First Amended Complaint

This First Amended Complaint includes two new Counts against Professor Sir Michael L. Rutter. Count VII alleges that he failed to disclose in at least four papers published between 2005 and 2009 that he had a crucial conflicting financial interest as a highly paid expert witness for the vaccine industry (and for the U.S. Government that defends industry in Vaccine Court) in at least three major litigation projects, U.S. litigation concerning mercury (thimerosal) as a cause of autism, the U.K. MMR litigation, and the U.S. Omnibus Autism Proceeding (concerning both MMR and thimerosal as causes of autism). Although Professor. Rutter's non-disclosure of a conflicting financial interest is precisely the same as that alleged against Dr. Wakefield (involvement in MMR litigation), the scope of Professor. Rutter's wrongful conduct is far worse, involving multiple litigation projects, at least four papers, and the more stringent modern disclosure obligation.

Count VIII alleges that Professor. Rutter gave false expert testimony in this FTP hearing by stating his opinion that Dr. Wakefield had a duty to disclose his participation in MMR litigation in the Lancet Case Series. In the alternative, Professor. Rutter misled the Panel by hiding his own non-disclosure of the same type of conflicting interest for which he condemns Dr. Wakefield. If Professor. Rutter doesn't honestly believe (although this would contravene the express language in the modern disclosure guidelines) that acting as a litigation expert on precisely the same subject discussed in his published papers (and on which he relies for his opinion in litigation) is a disclosable conflict, then he is falsely accusing Dr. Wakefield of breaching a non existent duty. Or, if he honestly believes this is a disclosable interest, then his testimony is false and misleading because he has concealed the fact of his own pattern of non disclosure.

Allegations in the Original Complaint

Count I alleges that Dr. Horton knew of Dr. Wakefield's participation the UK MMR litigation, did not consider it a disclosable interest, and hid this knowledge from Lancet readers in 1998. Dr. Horton's claim six years after publication of the Lancet Case Series that it would never have been published had he known of Wakefield's participation in MMR litigation was false because he was twice informed of Dr. Wakefield's relationship with MMR litigation a year before and five days after publication. Horton, not Dr. Wakefield, decided that the disclosure of a "perceived" conflict (where no actual conflict existed) was simply not necessary as part of the published Case Series. He concealed the Lancet's knowledge of Dr. Wakefield's participation in MMR

litigation when the possibility of "litigation bias" was raised by a reader immediately after publication. Attachment 1 is a side-by-side comparison of the letters received by Horton four days after publication, and the redacted version published in May, 2008. By feigning ignorance of the Wakefield litigation relationship, and outrage at somehow being misled, six years later when the allegations were raised by Deer, Horton was able to shift "blame" for decisions he had made and information he had concealed to a scapegoat (i.e. Drs. Wakefield, .Murch, and Walker Smith) once it had become evident that someone had to pay a price for the "unpleasantness" surrounding vaccine safety concerns. Moreover, Horton conspired with a "medical regulator" to motivate a GMC investigation while boasting that the GMC "had not a clue where to begin."

Count II alleges that Dr. Horton's informal "gag" rule barring publication of material critical of vaccine safety breaches his professional duty as Editor of the Lancet to support scientific freedom and freedom of inquiry and avoid censoring material that might be "politically" unpopular or critical of industry. Dr. Horton's de facto "gag" rule censoring publication of science that calls vaccine safety into question obstructs justice by depriving the courts of the evidence they would need to find a vaccine caused injury and is an unprofessional and misguided attack on the ethics of scientists and lawyers who would work together to seek justice for injured children.

Count III alleges that then Dean Zuckerman falsely denied his knowledge that Dr. Wakefield would, if asked at the press conference accompanying publication, recommend the single (monovalent) measles, mumps, and rubella vaccines as a precautionary measure until the safety of MMR could be further examined. Dr. Zuckerman's claim that he was unaware that vaccines would be discussed at a press conference accompanying publication was false because he had specifically instructed Dr. Wakefield to urge continued use of the monovalent measles vaccine as a safer alternative to MMR. Attachment 2 is Dr. Zuckerman's Jan. 22, 1998 letter instructing Dr. Wakefield to recommend the monovalent vaccines at the post-publication press conference ("It is vital, in your own interest and that of children, that you state clearly your support for monovalent vaccination.").

Count IV alleges that Dr. Pegg falsely claimed that the research biopsies for the Lancet children had not been approved by the Ethics Committee. Dr. Pegg's claim that the research aspects of Lancet Case Series were unethical was false because his own Ethics Committee had approved the collection of tissue samples (as project 162-95) well before the first child was ever examined. Attachment 3 is the Ethics Committee Sept. 5, 1995 approval letter for research biopsies.

Count V alleges that Dr. Salisbury has seriously misled the public by making unsupported claims regarding MMR safety. Dr. Salisbury's claim that MMR has an "exemplary" record of safety is unfounded and misleading. Two of the three brands of MMR have been withdrawn for safety reasons He has misused his official position by attempting to discredit and silence Dr. Wakefield and others who have a moral and ethical duty, and a right of free speech, to criticize the safety of MMR. Count VI alleges that he has also concealed material information relating to the safety of MMR from the public.

The False Testimony Has Fatally Inflused this FTP Hearing

The allegations of false and misleading testimony are directly relevant to the core charges before the Panel. Not only did Dr. Wakefield have no duty under the then-applicable disclosure standard, it was actually Dr. Horton that concealed Dr. Wakefield's participation in the MMR litigation, only to later feign ignorance to shift blame to a scapegoat for all the "unpleasantness" surrounding the debate over MMR safety. The research aspects of the biopsies on the Lancet children had in fact been approved by the Ethics Committee as Project 162-95. Professor. Rutter could not have honestly believed that Dr. Wakefield violated a disclosure obligation because he did not disclose his own much more extensive participation as an expert in defense of the vaccine industry in several papers. More generally, it will be impossible for the Panel to distill any remaining bits of honest testimony because the false testimony has been so pervasive and has infected the core subjects of this inquiry.

The Interest of the Complaining Organizations

The false testimony alleged in the First Amended Complaint has harmed, and will continue to harm, children by chilling and reducing funding for research into causes of and treatments for autism, and clinical care. The documentary evidence now reveals that there was no merit to the core allegations brought in 2004 by Complainant Brian Deer. Furthermore, the FTP proceeding has been irreparably tainted by false testimony. Accordingly, the Organizations in the First Amended Complaint ask that the FTP hearing against Drs. Wakefield, Murch, and Walker Smith be terminated immediately. Declaring this diversion at an end will facilitate a return to the urgent scientific and public health challenge at hand, finding the cause of and treatments for autism, and restoring public confidence in the vaccination program with an aggressive 'safety first" research agenda. The false testimony and the ensuing GMC FTP hearing have had the effect of delaying necessary research into cause and treatment for autism, and dissuading scientists from pursuing research relating to vaccines as a cause of chronic

disease. The ultimate victims of this false testimony are children whose autism could have been prevented or more effectively treated.

The MMR Controversy

This inquiry does not address and will not resolve the growing controversy over MMR safety, and the safety of the vaccine schedule in general. In 2005, the prestigious Cochrane Collaboration concluded, "The design and reporting of safety outcomes in MMR vaccine studies, both pre- and post-marketing is largely inadequate. The evidence of adverse events following immunisation with MMR cannot be separated from its role in preventing the target diseases." Demicheli V, Jefferson T, Rivetti A, et al. Vaccines for measles, mumps and rubella in children. Cochrane Database Syst Rev, 2005(4):CD004407. To date, the US Vaccine Court has paid 295 damage awards, and in vaccine injury cases decided since 1988 has paid $1.8 billion (an under-estimate of actual injury because of a very short statute of limitations).

The Vaccine-Autism Controversy

The US Vaccine Court (by decision) and the US Government (by concession) have concluded that vaccines, specifically MMR, can cause autism. The debate, and the need for reallocating research support, now shifts to how many children have been affected (for purposes of compensation) and how to prevent new cases and treat those already vaccine-damaged.

Vaccine-caused autism was first described in the medical literature by Sir Michael Rutter. In a lengthy review article on the biological basis of autism, Sir Michael described a genetic study of families affected by autism, from which some children were excluded on the basis that their autism could be explained by some known "medical condition of probable aetiological [causal] importance." Sir Michael explained one of the exclusions: "Only eight of the cases can be regarded as having a probably causal medical condition, a child with epilepsy and a temporal lobe focus on the EEG [Electroencephalogram] who had an onset following immunization." Rutter M et al., "Autism and known medical conditions: myth and substance," J Child Psychol and Psychiat. 1994;35:311-322. doi: 10.1111/j.1469-7610.1994.tb01164.x. PMID: 8188801.

The "vaccine court" in the United States began compensating vaccine autism claims in 1991. See Kleinert v. Dept. of Health and Human Services ("HHS"), 1991 WL 30664, (Cl.Ct., 1991 (No. 90-211V) (seizure disorder after DPT which is under control and a condition known as over-focussing, similar in some respects to autism). Since then, the court has published at least nine more decisions awarding compensation for vaccine-caused autism. HHS has found the evidence so persuasive that it has conceded liability before trial in an unknown number of autism cases. In a 2001 concession, Hiatt v. HHS, a child with MMR-caused autism was awarded $5.1 million dollars. In a case conceded in 2007, Poling v. HHS, a child who received five vaccines (nine antigens) in one day, one of which was MMR, developed autism. See Kirby, "The Vaccine Court Document Every American Can Read," Huffington Post (Feb. 26, 2008) CBS News: Court Links Hepatits B Vaccine to a Death.

In the most recent MMR case, the court found liability for MMR-caused ASD. See Banks v. HHS, 2007 WL 2296047 (Ct. Cl. 2007) (No. 02-0738V). The Court found that Bailey would not have suffered this delay but for the administration of the MMR vaccine...a proximate sequence of cause and effect leading inexorably from vaccination to PDD (autism). The Court ruled in a subsequent MMR case, Zeller v. HHS, 2008 WL 3845155, that the vaccine caused brain injury and developmental delay.

The Threat to Clinical Medicine

Much of this case surrounds the boundary between clinical care and research on human subjects (requiring ethics approval). GMC guidance specifically excludes "innovative therapeutic interventions" from the definition of "research." But this is precisely what the Royal Free was providing to desperately ill children. For a disciplinary body ten years later to reclassify clinical care as "research" (putting the licenses of some of the most prestigious doctors in the world) strikes at the heart of the profession of medicine, and will forever "chill" quality care.

Growing Concerns Over Prosecution Misconduct

In addition to issues of credibility, there is increasing concern of prosecutorial misconduct that the panel may wish to consider, including the intentional or negligent use of false testimony, withholding crucial evidence, and the mis-wording of a key charge.

Charge 39 Alleges the Wrong Disclosure Standard:

Charge 39 defines a "disclosable interest" as including: matters which could legitimately give rise to a perception of a conflict of interest in relation to your role as a co author of the Lancet paper.

This was not the disclosure standard applicable to Dr. Wakefield in 1998, which was:

The conflict of interest is a simple one. Is there anything e.g. a shareholding in or receipt of a grant or consultancy fees from a pharmaceutical company or a contract from a medical devices manufacturer that would embarrass you if it were to emerge after publication and you had not declared it.

The Lancet's rules in 1998 allowed authors to judge for themselves what they considered to be a conflict and disclose as necessary. However, the disclosure standard charged by the prosecution invites the Panel to judge a disclosable interest by an objective "reasonable person" standard. This reflects the current and much more strict standard, developed beginning in 2001. Dr. Horton and several journal editors explained the development of this more objective approach to disclosable conflicts as "The potential for conflict of interest can exist whether or not an individual believes that the relationship affects his or her scientific judgment." Davidoff, M., et al., "Sponsorship, Authorship, and Accountability," Lancet. 2001 Sep 15;358(9285):854 6. The prosecution charged the wrong standard because it had no evidence of Dr. Wakefield's state of mind, and therefore could not prove, a violation of the subject standard extant in 1998.

Prior Approval of Biopsies By Ethics Committee

Documents recently released under the Freedom of Information Act reveal that Complainant Brian Deer was specifically aware the taking of biopsies on the Lancet children for research purposes had the prior approval of the Ethics Committee, and therefore that his 2004 allegation of unethical research was false. Presumably he turned over this document to the GMC; otherwise he would have risked exposure as a fraud for withholding key evidence following any serious initial investigation by the GMC staff. Thus, the prosecution may have known as early as Deer's Complaint that the biopsies Attachment 4, had been approved by the Ethics Committee under project code 162-95. It is entirely possible that Deer withheld this document (although that would call into question his status as a bona fide investigative journalist), but a competent investigation should have uncovered the 162-95 approval. As alleged in the First Amended Complaint, Dr. Pegg (then Chairman of the Ethics Committee) gave false evidence and testimony by failing to acknowledge the 162-95 approval (perhaps because he failed to fulfill his duty under GMP to adequately investigate and prepare his testimony). Nevertheless, the actual approval letters for 162-95 were placed in evidence by Dr. Walker-Smith. See Ex. 38 (Sept. 5, 1995 Ethics Committee letter granting approval of project 162-95). Even if there had been no prior knowledge of the ethics approval on the part of the prosecution, the charges relating to the lack of ethics approval should have been summarily dismissed at this point. The 93 pages of GMC charges contain 89 references to 172-96 and specifically state there was no other applicable ethical approval. The pendency of allegations by an official body, GMC, of unethical research, now shown objectively to be false, causes ongoing harm to the accused doctors.

False Evidence and Testimony

The false testimony by five key prosecution witnesses has irreparably tainted this proceeding, undermining the guarantee of a fair decision. The integrity of the GMC is at risk in this proceeding. GMC has a solemn and vital responsibility to protect patients and public trust in the medical profession. But it is now clear that this prosecution was not brought in good faith, and should have been dismissed long ago. By re-labeling "innovative therapeutic interventions" and appropriate clinical care as "unethical research" and exposing the routine day-to-day decisions of a dedicated team of the country's leading scientists to meticulous scrutiny at risk of medical license, the practice of medicine will become increasingly mediocre and a noble profession turned into unskilled labor. This case is more a witch hunt or show trial, brought to settle old scores, "blame" innocent scapegoats for actions and inactions taken by many of the prosecution witnesses, conceal the poor quality of care given to desperately ill autistic children, divert attention from the lack of adequate research on vaccine safety, and generally to cover a host of backsides. The "chilling" damage done to these hard-working and dedicated doctors and to doctors and scientists generally – and thereby to the children they care for – is incalculable.

THE DENVER POST

Colleen O'Connor

Pilot program provides shots to kids in Denver schools

The Denver Post, 28 January 2010, 2:33 p.m.
https://www.denverpost.com/2010/01/28/pilot-program-provides-shots-to-kids-in-denver-schools/

The federal government on Thursday launched a new program in Denver designed to increase childhood immunization rates. It is the first school-located program in the country to offer vaccines to all students, regardless of socioeconomic status, experts say.

Denver is one of two cities to test the program in elementary schools and the only city to test it in middle schools.

As recently as 2003, Colorado ranked 50th in the nation for childhood immunizations. Dr. Judith Shlay, a family physician at Denver Health who is the project's principal investigator, said those rates are improving, but Colorado could do better, especially among adolescents.

According to the Centers for Disease Control and Prevention, in 2008 about 91 percent of Colorado kids between the ages of 13 and 17 were up to date on measles, mumps and rubella vaccine. But only 32.4 percent had been inoculated against meningococcal meningitis, which is recommended for teens.

"Adolescents are a hard population to reach," said Dr. Matthew Daley, a pediatrician and vaccine research expert with Kaiser Permanente who is working with researchers at the University of Colorado and Denver Health Medical Center to evaluate the model.

By the time they reach middle school, most kids are up to date on vaccines required to enroll in school. And they are typically well, so they don't often visit a doctor who might recommend they receive inoculation for illnesses such as human papillomavirus and influenza.

"This is the most important preventative service we can offer children," said Dr. Judith Shlay, a family physician at Denver Health who is the project's principal investigator.

Offering inoculations at school makes life much easier for parents, who don't need to leave work to drive kids to a clinic or doctor's office. They just sign consent forms that are sent home, and then everything is done at school.

Parents never see a bill. The health insurance plans are billed directly.

Funding for the program comes from two grants from the CDC totaling $1.6 million.

The program is run by a partnership made up of Denver Public Schools, Denver Health, the University of Colorado Denver and Kaiser Permanente.

It's being tested in 20 elementary schools and eight middle schools, where a total of 4,000 students are expected to receive vaccines by the end of this school year.

On Thursday, about 130 students at Henry Middle School were vaccinated for seasonal and H1N1 influenza, meningococcal meningitis and for tetanus, diphtheria and pertussis. Girls also received HPV.

At the auditorium in Henry, students got a shot in each arm and a whiff of nasal spray. “I was really scared at first,” said Cheyenne Schneider, 13. “I was really happy they did it all at once. I just felt a pinch. It turned out better than I thought.”

In Denver elementary schools, the children receive flu vaccines.

According to the CDC, during the 2007-08 school year, 21 percent of Colorado’s school-age kids who were not in high-risk groups were vaccinated against flu; 36 percent of the kids in high-risk groups received the inoculation.

“That’s not good,” Shlay said. “It should be higher.”

Middle-school students will receive a booster for tetanus, diphtheria and pertussis. Shlay said that in the 2006-07 school year, 63 percent of Colorado’s adolescent students received the vaccine, compared with the national average of 41 percent.

“That is a required vaccination and still not all kids were vaccinated, so there’s room to grow,” Shlay said.

On Thursday, participating teens also were vaccinated for flu and meningococcal meningitis, which are not required by the state.

Research goals of the program include determining the cost of school-located vaccinations, the feasibility of billing health insurance plans, and how well they are accepted by parents and providers.

Data also will be collected to compare the vaccination rates in schools where this program is provided with schools not part of the pilot.

MEDICAL VERITAS
THE JOURNAL OF TRUTH IN HEALTH SCIENCE

Leonard G. Horowitz

Medicine Misdirected Publishing Monopoly

Medical Veritas: The Journal of truth in Health science, 2010, January, N 1
https://web.archive.org/web/20100119152527/http://web.mac.com/len15/MedicalVeritas/Volume_7;_Number_1_January,_2010.html

Special Message from the Editor

This new online format of MEDICAL VERITAS features an article by investigative journalist Sherri Kane in collaboration with this new Editor-in-Chief, submitted (Dec. 3, 2009) for publication initially to The Lancet. "PHARMAGANDA: A Study in Conflicting Interests," we sent to Lancet editors because they published a commentary on April 6, 2002, condemning the impact of special interests on the practice of medicine.

A few days later (Dec.10, 2009) we received a rejection notice from the Senior Executive Editor, Sabine Kleinert, without any criticism or suggested redirection as the system of peer reviewing was established to provide for everyone's benefit in advancing science.

Determined to understand why this rejection was administered, in light of this paper's obvious urgency, I Google-searched the corporate owners of The Lancet and quickly determined the journal's publisher, Elsevier, had been purchased by the Reed Company. The merger formed Reed-Elsevier, a virtual monopoly over the entire medical and scientific publishing industry.

Elsevier alone publishes 250,000 articles annually in 2000 journals. How many of these can a good doctor read? Reed-Elsevier's archives contain seven million publications important to authors who research the "old stacks." Total yearly downloads of this company's articles amount to 240 million. Multiply that times $30 per download and you get more than $7 billion.

Who's making the money? Not surprisingly, BigPharma mainly.

Recently, in an Australian court, Merck & Co. was sued by a user of VIOXX. The plaintiff alleged that Merck paid Elsevier to publish the Australasian Journal of Bone and Joint Medicine, which appeared to be a peer-reviewed academic journal but only contained articles promoting Merck's drugs. => https://en.wikipedia.org/wiki/Australasian_Journal_of_Bone_%26_Joint_Medicine

Merck first denied claims that the articles in this "complimentary publication" were authored by Merck's ghost writers. Company officials defended saying all reprints came from peer-reviewed medical journals. In May 2009, however, Elsevier conceded by stating that their "sponsored article compilation publications," are produced "on behalf of pharmaceutical clients," and are "made to look like journals." The company admitted neglecting "the proper disclosures" fooling doctors and patients alike.

ChoicePoint

Even more disturbing is that Reed-Elsevier purchased ChoicePoint in 2008 for $3.6 billion in cash.

According to online descriptions of ChoicePoint, this is a "prime intelligence service." The company supplies governments and multinational corporations with demographic data, including

confidential voter records. The company is best known for its administration of corrupted records used to certify Past-President George W Bush's contested 2000 election.

ChoicePoint=> https://web.archive.org/web/20100303000705/http://en.wikipedia.org/wiki/ChoicePoint

Yes, you read that right. According to Wiki online:

"In the aftermath of the vote, the owner of DBT Online, ChoicePoint, was accused of cooperating with Florida Governor Jeb Bush, Secretary of State of Florida Katherine Harris, and Florida Elections Unit Chief Clay Roberts, in the voter fraud conspiracy involving the central voter file. It was also accused of having a bias in favor of the Republican Party, for knowingly using inaccurate data, and for racial discrimination."

Additional online research shows that many people are concerned about ChoicePoint's census data, acquired and provided to untrustworthy agents, government agencies, companies and even crime rings.

It seems even those interested in geneology or genetics--like leading eugenicists and "family planning" pioneers Margaret Sanger and Adolf Hilter--reference ChoicePoint's copious provision of data to anyone for a price.

Even the Better Business Bureau has warned unwary residents to resist disclosing confidential information to ChoicePoint's census informers that are now walking door to door across America.2

The Royal Society of Medicine

To advance this investigation further, following The Lancet rejection, we submitted, "PHARMAGANDA: A Study in Conflicting Interests," for review and possible publication in the Journal of the Royal Society of Medicine (JRSM).

I considered adding to my cover letter, but didn't, an appeal to their editors and peer reviewers that they could either be heros and publish this urgent, honest, life-saving labor of love, or generate "instant-karma" when I relay to my regular readers, whose numbers certainly make JRSM's circulation pale by comparison, their rejection notice.

The prompt response from the JRSM Editor, Kamran Abbasi, was intriguing. He wrote, "Thank you for submitting your article . . . I read it with interest, but I am afraid . . . "

I wrote back, "If you read it with interest, what made you disinterested?"

We certainly deserved to gain some feedback, or hear his truth, as I spent at least a half hour filling in all the required fields in their online submission forms. But he never replied.

I reckon that medical doctors in Britain and elsewhere deserve to know what Dr. Abbasi neglected to admit – that The Wellcome Trust, among the JRSM's leading contributors, was royally exposed in our "study."

Ironically, in completing this online application, their instructions cite The Wellcome Trust in an explanation of how to disclose conflicting interests and financial support for submissions!

So if you ever hear someone reference one of Reed-Elsevier-ChoicePoint's myriad journals and articles as "solid scientific proof," or disparage those advancing truth elsewhere, you can simply rest content knowing MEDICAL VERITAS evidenced otherwise.

Edmund DeMarche, Miriam Falco and Nicole Bliman

More than 1,000 get mumps in New York, New Jersey since August

CNN, 8 February 2010, 10:00 p.m. EST
https://web.archive.org/web/20100214075155/http://edition.cnn.com/2010/HEALTH/02/08/mumps.outbreak.northeast/index.html?hpt=T2

New York (CNN) - More than 1,000 people in New Jersey and New York, many of them adolescent Orthodox Jews, have been sickened with mumps since August, health authorities said Monday.

Orange County, New York, has confirmed 494 cases since early November, county spokesman Richard Mayfield told CNN. Almost all of those infected with the virus are of the Orthodox or Hasidic Jewish population, and their average age is 14, he said.

Neighboring Rockland County has confirmed 317 cases since August, with all of the sick from the Orthodox Jewish community, said Kathleen Henry, county Deputy Commissioner of Health. Their average is 14 to 18, she said.

Just south of the two counties, in New York City, Brooklyn had 79 confirmed cases of mumps as of October 30, the Centers for Disease Control and Prevention reported in November. Any confirmation of other infections in the city are expected to be announced Tuesday.

The mumps outbreak began at a summer camp for Orthodox Jewish boys in Sullivan County, New York, according to the CDC. Health officials have linked the outbreak to an 11-year-old boy at the camp. He had recently returned from the United Kingdom, where a mumps outbreak had spread to 4,000 people.

The mumps outbreak also spread to Ocean County, New Jersey, where 159 confirmed cases have been diagnosed since September, county spokeswoman Leslie Terjesen told CNN. An additional 70 others are suspected of having mumps, she said.

Only seven of the infected are not Orthodox Jewish, but they all had exposure to the community, Terjesen said. The average age of the sick is 21, she said.

Lakewood, New Jersey, Rabbi Yehunda Pirutinsky was surprised when his 14-year-old son was diagnosed with mumps a week ago. Lakewood is in Ocean County.

"He was completely vaccinated," Pirutinsky said. "So it was a surprise to us he came down with mumps."

Anyone fully vaccinated from mumps receives two doses of the vaccine, according to the CDC. Of the New Jersey cases, 77 percent were vaccinated, Terjesen said.

But the vaccine is not 100 percent effective, according to the CDC. At two doses, the vaccine is 76 to 95 percent effective, the CDC says on its Web site.

In November, the CDC called the spike in mumps cases, "the largest U.S. mumps outbreak since 2006, when the United States experienced a resurgence of mumps with 6,584 reported cases." Then, only 179 people were sickened in New York and New Jersey.

Mumps is a contagious disease caused by a virus, according to the CDC. Initial symptoms appear 12 to 25 days after infection and include fever, headache, muscle aches and loss of appetite. Mumps can cause the jaw and cheeks to swell, with further complications including the inflammation of the brain, testicles or ovaries, and deafness, according to the CDC.

Pirutinsky's son has fully recovered from his bout with mumps, which Pirutinsky assumes he contracted while at his Jewish high school. A doctor advised the teenager to not attend school for a week and limit time with his siblings, Pirutinsky said.

The outbreak has disproportionately affected Orthodox Jewish communities, but Pirutinsky said he wasn't overly worried.

"I wouldn't say the community is alarmed, but it's something we're aware of," he said.

Mike Adams

Mumps outbreak spreads among people who got vaccinated against mumps

Natural News, 11 February 2010
https://www.naturalnews.com/028142_mumps_vaccines.html

To hear the vaccine pushers say it, all the recent outbreaks of mumps and measles are caused by too few people seeking out vaccinations. It’s all those “non-vaccinated people” who are a danger to society, they say, because they can spread disease.

Reality tells a different story, however: It is the vaccinated people who are causing these outbreaks and spreading disease!

Just this week, an outbreak of mumps among more than 1,000 people in New Jersey and New York has raised alarm among infectious disease authorities. The outbreak itself is not unusual, though. What’s unusual is that the health authorities slipped up and admitted that most of the people infected with mumps had already been vaccinated against mumps.

In Ocean County, New Jersey, county spokeswoman Leslie Terjesen told CNN that 77 percent of those who caught mumps had already been vaccinated against mumps.

77 of those infected had been vaccinated

Usually this information is censored out of the press. The vaccine industry wants the public to believe that vaccines are effective at preventing infection. So the media typically refrains from reporting what percentage of the infected people were already vaccinated against the infectious disease.

But in this case, the 77 percent figure slipped out. And now intelligent observers are increasingly seeing the truth about these vaccines:

• Infectious disease vaccines simply don't work. If they did, then why did all these children who were already vaccinated still get mumps?

• Vaccines may actually increase your risk of disease. Notice that far more vaccinated children were stricken with mumps than non-vaccinated children?

• The people who administer vaccines never tell you that their vaccines don't really work. They tell you that you'll be "protected" with the vaccine, implying a near-100% level of protection (which is blatantly false).

• Even if you're vaccinated against a disease, you may still catch that disease anyway! So what's the point of the vaccine?

The lies of the CDC

The CDC claims the mumps vaccine is 76 to 95 percent effective, but they offer no scientific evidence whatsoever to support that claim. To date, there has never been a randomized, double-blind placebo-controlled study published on the mumps vaccine in humans. The so-called "scientific" evidence supporting these vaccines is purely imaginary.

I still have a $10,000 reward offered for anyone who can provide a single scientific study proving the safety and effectiveness of any H1N1 vaccine.

=> https://www.naturalnews.com/027985_H1N1_vaccines_safety.html

To date, not a single person has stepped forward to claim that $10,000. I might as well raise the reward to a million dollars, because I'll never have to pay it: There is no scientific evidence proving the safety and effectiveness of these vaccines!

Does being vaccinated raise your risk of infection?

The CDC also says that 2009 was a bad year for mumps outbreaks. They blame all the people who refuse to be vaccinated for causing these outbreaks. Their theory, of course, is based on the imaginary idea that mumps vaccines halt mumps infections. But once again, it's all imaginary! As we saw this week in New Jersey, most of the people who get infected in these outbreaks are the very people who were vaccinated!

If mumps vaccines actually worked, then what you should see instead is the mumps infection spreading among those who refused the vaccines, right? It's only logical.

In fact, if vaccines really work, then why should the vaccinated people be bothered at all by those who don't get vaccinated? After all, if their vaccines protect themselves from disease, then non-vaccinated people are no threat to them, right? So why are vaccinated people so pushy about forcing non-vaccinated people to get vaccinated?

The shocking truth about infectious disease and vaccines, however, is very different from what you're told by the drug companies (and the health authorities who pander to their interests): Some vaccines may actually promote the very diseases they claim to prevent!

That may be why 77% of those who recently got mumps in New Jersey were, in fact, the very people who were vaccinated against mumps. The vaccine may, in fact, weaken your immune system against future infections, causing you to become more susceptible to future outbreaks.

Many thousands of Americans who died from H1N1 swine flu were the very people who got vaccinated against H1N1

=> https://www.naturalnews.com/027956_H1N1_vaccine_CDC.html

The great vaccine hoax exposed

Take a look at nearly every outbreak of infectious disease in recent years and you'll find the same pattern. You'll either see that most of those who got infected were already vaccinated, or you'll see those statistics completely stripped out of all media reports.

It's all part of the grand vaccine cover-up. Vaccines simply do not work as promised. Vaccines do not offer the level of protection against infectious disease that they promise. In fact, vaccines are far less effective than vitamin D in preventing infections!

Instead of shooting up our children with over 100 different vaccines (which is now standard practice, by the way), what we should be doing is boosting their immune function with vitamin D, zinc and immune-boosting nutrients from medicinal plants. That would protect them from all common infectious diseases at the same time, and it doesn't require needles or the use of dangerous chemical preservatives like thimerosal, which is linked to autism.

Don't believe the recent attacks on Dr. Wakefield. This was an organized smear campaign designed to discredit Dr. Wakefield before he could publish the results of his "14 monkeys" study that shows severe neurological harm caused by vaccines given to young primates

=> https://www.naturalnews.com/028109_Andrew_Wakefield_Jenny_McCarthy.html

There is a way to protect people from infectious disease: Give them the immune-boosting nutrients their immune systems need to defend themselves against disease. Outbreaks of infectious disease would plummet along with seasonal flu deaths.

Of course, so would sales of vaccines. And that's the whole reason you never hear health authorities recommending vitamin D even though it's far more effective than any vaccine at preventing infectious disease. => https://www.naturalnews.com/027385_Vitamin_D_swine_flu_vaccine.html

The CDC, we now know, is little more than the marketing branch of Big Pharma's vaccine operations. That's why the former head of the CDC, Dr. Julie Gerberding, is now suddenly the president of Merck's worldwide vaccine division.

=> https://www.naturalnews.com/027789_Dr_Julie_Gerberding_Merck.html

Vaccines make lots of money, but they don't make people immune to disease. The fact that so many vaccinated people are being stricken with the very diseases they were vaccinated against is proof that vaccines fail to deliver what they promise.

Open letter from National Coalition of Organized Women on legislation side-lining parental consent

National Coalition of Organized Women, 10//16 February 2010, 09:56

https://web.archive.org/web/20100220013832/http://www.theflucase.com/index.php?option=com_content&view=article&id=2755%3Aopen-letter-from-national-coalition-of-organized-women-on-legislation-side-lining-parental-consent&catid=1%3Alatest-news&Itemid=64&lang=en

From Laboring Women to Labor Unions, We Move as One
From the desk of the Director

S4479, A6702: Health care practitioner may diagnose, treat or prescribe treatment for a sexually transmissible disease for a person under age eighteen without the consent or knowledge of his or her parents or guardians.

A0778: New York adds such recommended vaccination [HPV] to the list of vaccinations required for school entry

"Is it not the parents and families that must spend their lives, and money, as caretakers should a vaccine injury or adverse event occur to their child? It stands to reason then, that parents should be in on their underage child's health decisions. After all, they are the ones who will bear the life long burden of an adverse event! Or will they? Should the State bear the cost and burden of rehabilitation and caretaking for a child who has been debilitated by the vaccine or treatment since the parents, legislatively kept in the dark, have, in essence, had their responsibility in this matter eviscerated by the State"? – Eileen Dannemann, Director, NCOW

We are on very dangerous grounds when the State tries to protect children from the beliefs of their parents and, more so, passes laws to purposefully deceive them.

Although Sen. Krueger stresses ethics and "transparency" in government she evidences, instead, a proclivity for an absence of transparency; a preference for deception; and an intention to facilitate a widening of the gulf between parent and child demonstrating a glaring inattention to the values of honesty and focus on the family.

As honorable as their deepest intention may be, the passage of Sen. Krueger's and Assembly woman Poulin's legislations puts a green light on indiscriminate sex, specifically on sexual intercourse, amongst the youngest of our adolescents who may perceive being vaccinated as being the same as "safe sex" and freedom from sexual disease, which it certainly is not.

Moreover and perhaps most morally objectionable these legislations amount to the lawful sanctioning of the practice of deception. This is not the type of education we expect either from our schools or from Albany leadership.

S4779B, A6702 not only violates parental rights and responsibility to make healthcare decisions on behalf of their children but these legislations serve as a national signal for the lawful condoning of deception. It occurs to us that condoning "lying" has no place in law and is antithetical to concept of judicial prudence.

A0778 is a mandate to vaccinate every child with a strain specific vaccine that since its inception claims 16,000 adverse events including death, crippling and ruined lives. It is backed by only spurious short-term studies that continue to prove disastrous. It is a vaccine that its manufacturer claims at best protects against only 2 out of the myriad of strains of HPV. In many cases the HPV vaccine causes debilitating and sometimes crippling lifelong conditions.

DOI: 10.1002/14651858.CD004876.pub3.

Thomas RE, Jefferson T, Lasserson TJ.
Influenza vaccination for healthcare workers who work with the elderly
Cochrane Database of Systematic Reviews 2010, Issue 2. Art. No.: CD005187.
DOI: 10.1002/14651858.CD005187.pub3.
https://ph.cochrane.org/sites/ph.cochrane.org/files/uploads/PR%20Cochrane%20Issue%202%202010.pdf#%5B1%2C%7B%22name%22%3A%22XYZ%22%7D%2C61%2C456%2C0%5D

Evidence for the safety and efficacy of influenza vaccines in the over 65s is poor, despite the fact that vaccination has been recommended for the prevention of influenza in older people for the past 40 years. These are the conclusions of a new Cochrane Systematic Review.

Adults aged 65 and over are some of the most vulnerable during influenza season and a priority for vaccination programmes. However, very few systematic reviews of the effectiveness of vaccines in this group have ever been carried out.

The researchers conducted a thorough search of studies based on previous vaccine trials.
Randomised controlled trials (RCTs) are often considered the "gold standard", but of the 75 studies included in their review, the researchers were only able to identify one recent RCT with "real" outcomes. In other words, this was the only RCT that used influenza cases as an outcome, as opposed to surrogate outcomes such as measurements of influenza antibodies in the blood. All the other studies included in the review were deemed of low quality and open to bias.

Limited reliable evidence from the studies suggests that the effectiveness of influenza vaccines is modest at best. "Our estimates are consistently below those usually quoted by economists and in decision making," says lead researcher Tom Jefferson of the Cochrane Collaboration in Rome, Italy. "But until we have all available evidence, it is hard to reach any clear conclusions about the effectiveness of influenza vaccines in older people."

"As the evidence is so scarce at the moment, we should be looking at other strategies to complement vaccinations. Some of these are very simple things like personal hygiene, and adequate food and water," says Jefferson. "Meanwhile, we need to undertake a high quality, publicly funded trial that runs over several seasons to try to resolve some of the uncertainties we're currently facing."

Jefferson is also one of the authors of a second review publishing this week, which focuses on the efficacy of influenza vaccinations in healthcare workers who work with the elderly. The results are also inconclusive, with each of the four trials included in the review being of inadequate quality and reaching implausible conclusions. The researchers were unable to draw any conclusions about whether vaccinating healthcare workers helps to prevent influenza symptoms and death in people aged over 60.

£115m annual flu jab cost 'may be a waste of money'

Daily Mail, 17 February 2010, 09:40 BST
https://www.dailymail.co.uk/health/article-1251562/115m-annual-flu-jab-cost-waste-money.html

The annual £115million cost of giving flu jabs to the elderly may be a complete waste of money, a major review said yesterday. The injections fail to prevent deaths or provide the expected health benefits, according to researchers.

They analysed data from 75 studies to determine whether vaccination of older people works.

The researchers - whose findings are published today in The Cochrane Library - could identify only one 'gold standard' clinical trial where the results revealed if having a jab prevented an attack of the flu or mitigated complications. The remainder looked at outcomes such as producing antibodies to flu viruses in the blood.

Lead researcher Dr Tom Jefferson of the Cochrane Collaboration in Rome, Italy, said limited reliable evidence suggested flu vaccination has only 'modest' effectiveness. He said: 'Our estimates are consistently below those usually quoted by economists and in decision making. 'But until we have all available evidence, it is hard to reach any clear conclusions about the effectiveness of influenza vaccines in older people. 'As the evidence is so scarce at the moment, we should be looking at other strategies to complement vaccinations. 'Some of these are very simple things like personal hygiene, and adequate food and water. 'Meanwhile, we need to undertake a high- quality, publicly funded trial that runs over several seasons to try to resolve some of the uncertainties we are currently facing.'

The Cochrane Library is a publication of The Cochrane Collaboration, an international organisation that evaluates healthcare research using protocols that identify relevant trial data which is pooled together and analysed.

Everyone aged 65 and over and younger people with certain health conditions are eligible for a free jab on the NHS, costing £115million. Every year more than 15million people in England alone receive a free flu jab, with around three out of four aged 65 or over getting vaccinated.

Are flu jabs for the elderly a waste of money?

Controversy has grown over the benefits of vaccinating those over 65, with at least two major studies in the past two years claiming they have been 'greatly exaggerated', and there are no figures to back up claims that lives are being saved.

In a similar study in 2008, Dr Jefferson said there was little evidence to show the flu jab had any impact on the length of hospital stays, time off work and death rates in healthy adults.

In the most recent study, co-authored by Dr Jefferson, he looked at four trials on the efficacy of flu vaccines in healthcare staff who work with the elderly.

Researchers found the results were 'inconclusive', with each trial being of inadequate quality and reaching implausible conclusions so it was impossible to ascertain whether vaccinating workers cut deaths and prevented symptoms in people over 60.

Professor David Salisbury, director of immunisation for the Department of Health, said: 'This review does not provide any new evidence.

'We know that influenza vaccines, like other vaccines, are less effective in the elderly. This was taken into account before the recommendations for routine flu vaccination for the over-65s.'

The flu jab's co-inventor, biochemist Graeme Laver, told the Daily Mail in 2007 that the jab did not guarantee protection.

Dr Laver, who died in 2008, said: 'I have never been very impressed with its efficacy. 'It is better than nothing and I wouldn't want to advise people not to take it, but you can't rely on it doing any good.'

ScienceDaily

Influenza Vaccines: Poor Evidence for Effectiveness in Elderly

Science Daily, 17 February 2009

https://web.archive.org/web/20100221082304/http://www.sciencedaily.com/releases/2010/02/100216203146.htm

ScienceDaily (Feb. 17, 2010) – Evidence for the safety and efficacy of influenza vaccines in the over 65s is poor, despite the fact that vaccination has been recommended for the prevention of influenza in older people for the past 40 years. These are the conclusions of a new Cochrane Systematic Review.

Adults aged 65 and over are some of the most vulnerable during influenza season and a priority for vaccination programmes. However, very few systematic reviews of the effectiveness of vaccines in this group have ever been carried out.

The researchers conducted a thorough search of studies based on previous vaccine trials. Randomised controlled trials (RCTs) are often considered the "gold standard," but of the 75 studies included in their review, the researchers were only able to identify one recent RCT with "real" outcomes. In other words, this was the only RCT that used influenza cases as an outcome, as opposed to surrogate outcomes such as measurements of influenza antibodies in the blood. All the other studies included in the review were deemed of low quality and open to bias.

Limited reliable evidence from the studies suggests that the effectiveness of influenza vaccines is modest at best. "Our estimates are consistently below those usually quoted by economists and in decision making," says lead researcher Tom Jefferson of the Cochrane Collaboration in Rome, Italy. "But until we have all available evidence, it is hard to reach any clear conclusions about the effectiveness of influenza vaccines in older people."

"As the evidence is so scarce at the moment, we should be looking at other strategies to complement vaccinations. Some of these are very simple things like personal hygiene, and adequate food and water," says Jefferson. "Meanwhile, we need to undertake a high quality, publicly funded trial that runs over several seasons to try to resolve some of the uncertainties we're currently facing."

Jefferson is also one of the authors of a second review publishing this week, which focuses on the efficacy of influenza vaccinations in healthcare workers who work with the elderly. The results are also inconclusive, with each of the four trials included in the review being of inadequate quality and reaching implausible conclusions. The researchers were unable to draw any conclusions about whether vaccinating healthcare workers helps to prevent influenza symptoms and death in people aged over 60.

THE LOCAL se

Peter Vinthagen Simpson

Study concludes: Influenza vaccine has no effect

The Local, 17 February 2010, 08:14 CET
https://web.archive.org/web/20100218140018/http://www.thelocal.se/25036/20100217/

There is no evidence to support the contention that the influenza vaccine administered to the over 65s is of any more use than opening the windows and washing hands, a new study from the Cochrane Collaboration claims, according to a report in the Svenska Dagbladet newspaper.

The Cochrane Collaboration, an international not-for-profit organization providing up-to-date information about the effects of health care, has compiled data from 40 flu seasons worldwide.

The institute has concluded from the studies that there is no clear evidence to suggest that the flu jab offers any more protection than cheaper, hygiene-based methods such as hand-washing.

"Our analysis is compiled using millions of data from 40 seasons worldwide. What we have seen is that the influenza vaccine can at best have a very small effect," said Thomas Jefferson, one of the authors of the report, to the newspaper.

The Swedish Welfare Board (Socialstyrelsen) has for the past 40 years advised all those over 65-years-old to take an annual dose.

Most local health authorities in Sweden pay for the flu jab at a cost to the taxpayer of 25-30 million kronor ($3.5 million) per annum.

This is not the first time the Cochrane Collaboration has sounded the alarm over the paltry effects of the vaccine with a report published four years ago drawing the same conclusions, according to the newspaper.

The institute has now selected the best 75 of the available studies for this latest review of the evidence. While conceding that the studies are not of the best research quality, it concludes there is little evidence to suggest that the flu vaccine has any real effect.

The institute thus recommends a larger international, state-financed study to examine the vaccine and existing healthcare recommendations.

The Telegraph

Rebecca Smith

Flu vaccinations for the elderly may be a waste of time as there is little evidence they do any good, a major review has found

The Telegraph, 17 February 2010, 7:15AM GMT
https://www.telegraph.co.uk/news/health/news/7249687/Flu-jab-for-the-elderly-may-be-a-waste-of-time-review-of-evidence.html

The review, published by the Cochrane Library, examined 75 scientific studies of influenza vaccines and said there was only "poor" evidence that they were actually effective in preventing the illness.

The review found the vaccine was not as effective if it was not well matched to the flu strains circulating or there was poor uptake of the jab among those who would benefit most. Also, some elderly people did not respond to the vaccine.

In addition, other diseases have symptoms very similar to flu but are not caused by influenza viruses and so cannot be prevented with the vaccine. Because they are so similar they may be counted as flu.

It follows a series of other studies which have suggested that hospital admissions due to influenza or pneumonia are not affected by flu vaccination rates.

Simple hand washing and good personal hygiene should be promoted as well as vaccination, the authors of the review said.

All people aged over 65 are offered the seasonal flu vaccine and around three quarters have it, the latest Government figures show and is thought to cost around £150 million a year.

The vaccine contains three strains of flu and is matched to the strains circulating by the World Health Organisation each year.

Around 12,000 people die of flu-related illnesses in Britain each year, according to Government data, but this is disputed and some experts say this figure is too high.

Lead researcher Tom Jefferson of the Cochrane Collaboration in Rome, Italy, said: "Our estimates are consistently below those usually quoted by economists and in decision making.

“But until we have all available evidence, it is hard to reach any clear conclusions about the effectiveness of influenza vaccines in older people.

“As the evidence is so scarce at the moment, we should be looking at other strategies to complement vaccinations. Some of these are very simple things like personal hygiene, and adequate food and water.

“Meanwhile, we need to undertake a high quality, publicly funded trial that runs over several seasons to try to resolve some of the uncertainties we’re currently facing.”

Professor David Salisbury, Director of Immunisation at the Department of Health, said: "This review does not provide any new evidence. We know that Influenza vaccines, like other vaccines, are less effective in the elderly. This was taken into account before the recommendations for routine flu vaccination for the over 65s.

"Some of the Cochrane review recommendations such as electricity, food and sanitation as ways of preventing influenza are not supported by any evidence.

"The new H1N1 swine flu vaccines have shown us that better immune responses are possible, even with very low doses of vaccine. This is encouraging as it means we may get better vaccines soon for this group."

There has also been controversy recently over the swine flu vaccine which is being offered to people with long-term illnesses, pregnant women and children under the age of five. Some believe the disease is not serious enough to warrant vaccination.

Dr Jefferson is also one of the authors of a second review which analysed the effect of vaccinating healthcare staff who work with the elderly.

The results were also inconclusive, with each of the four trials included in the review being of inadequate quality and reaching implausible conclusions, he found.

The researchers were unable to draw any conclusions about whether vaccinating healthcare workers helps to prevent influenza symptoms and death in people aged over 60.

FIERCE Pharma

John Carroll

Study: No hard evidence that flu vaccine protects the elderly

Fierce Pharma, 18 February 2010, 9:01am
https://www.fiercepharma.com/vaccines/study-no-hard-evidence-flu-vaccine-protects-elderly

After a detailed analysis of 75 scientific studies, a group of researchers at the Cochrane Library has concluded that there's little hard evidence to prove that the annual flu vaccination campaign for the elderly does any good.

The vaccine won't work unless it's particularly well matched to the flu strains in circulation, say the researchers. Some of the elderly don't respond to the vaccine at all, and the most vulnerable often don't bother to get a shot. And the data on flu rates in older people is often badly skewed by ailments that have the same symptoms as flu but aren't affected by vaccine at all.

The analysis drew considerable attention in the U.K., where the government pays about 150 million pounds a year to vaccinate three quarters of the older population. Officially, the government estimates that the flu kills about 12,000 people a year in England. But the Cochrane group says there really are no good estimates available and the government figure is probably far too high.

"As the evidence is so scarce at the moment, we should be looking at other strategies to complement vaccinations," notes Tom Jefferson of the Cochrane Collaboration in Rome. "Some of these are very simple things like personal hygiene, and adequate food and water. Meanwhile, we need to undertake a high quality, publicly funded trial that runs over several seasons to try to resolve some of the uncertainties we're currently facing."

There's been widespread recognition among vaccine manufacturers that the currently available vaccines are least effective in the elderly. And there are a number of new programs underway to design a vaccine that can protect this patient population. => here's the story from *The Telegraph*

Mike Adams

Big Pharma researcher admits to faking dozens of research studies for Pfizer, Merck

Natural News, 18 February 2010 10:49
http://www.naturalnews.com/028194_Scott_Reuben_research_fraud.html

It's being called the largest research fraud in medical history. Dr. Scott Reuben, a former member of Pfizer's speakers' bureau, has agreed to plead guilty to faking dozens of research studies that were published in medical journals.

Now being reported across the mainstream media is the fact that Dr. Reuben accepted a $75,000 grant from Pfizer to study Celebrex in 2005. His research, which was published in a medical journal, has since been quoted by hundreds of other doctors and researchers as "proof" that Celebrex helped reduce pain during post-surgical recovery. There's only one problem with all this: No patients were ever enrolled in the study!

Dr. Scott Reuben, it turns out, faked the entire study and got it published anyway. It wasn't the first study faked by Dr. Reuben: He also faked study data on Bextra and Vioxx drugs, reports the Wall Street Journal.

As a result of Dr. Reuben's faked studies, the peer-reviewed medical journal Anesthesia & Analgesia was forced to retract 10 "scientific" papers authored by Reuben. The Day of London reports that 21 articles written by Dr. Reuben that appear in medical journals have apparently been fabricated, too, and must be retracted.

After being caught fabricating research for Big Pharma, Dr. Reuben has reportedly signed a plea agreement that will require him to return $420,000 that he received from drug companies. He also faces up to a 10-year prison sentence and a $250,000 fine.

He was also fired from his job at the Baystate Medical Center in Springfield, Mass. after an internal audit there found that Dr. Reuben had been faking research data for 13 years.
http://www.theday.com/article/20100115/NWS01/100119833

Business as usual in Big Pharma

What's notable about this story is not the fact that a medical researcher faked clinical trials for the pharmaceutical industry. It's not the fact that so-called "scientific" medical journals published his fabricated studies. It's not even the fact that the drug companies paid this quack close to half a million dollars while he kept on pumping out fabricated research.

The real story here is that this is business as usual in the pharmaceutical industry.

Dr. Reuben's actions really aren't that extraordinary. Drug companies bribe researchers and doctors as a routine matter. Medical journals routinely publish false, fraudulent studies. FDA panel members regularly rely on falsified research in making their drug approval decisions, and the mainstream media regularly quotes falsified research in reporting the news.

Fraudulent research, in other words, is widespread in modern medicine. The pharmaceutical industry couldn't operate without it, actually. It is falsified research that gives the industry its best marketing claims and strongest FDA approvals. Quacks like Dr Scott Reuben are an important part of the pharmaceutical profit machine because without falsified research, bribery and corruption, the industry would have very little research at all.

Pay special attention to the fact that the Anesthesia & Analgesia medical journal gladly published Dr. Reuben's faked studies even though this journal claims to be a "scientific" medical journal based on peer review. Funny, isn't it, how such a scientific medical journal gladly publishes fraudulent research with data that was simply invented by the study author. Perhaps these medical journals should be moved out of the non-fiction section of university libraries and placed under science fiction.

Remember, too, that all the proponents of pharmaceuticals, vaccines and mammograms ignorantly claim that their conventional medicine is all based on "good science." It's all scientific and trustworthy, they claim, while accusing alternative medicine of being "woo woo" wishful thinking and non-scientific hype. Perhaps they should have a quick look in the mirror and realize it is their own system of quack medicine that's based largely on fraudulent research, bribery and corruption.

You just have to laugh, actually, when you hear pushers of vaccines and pharmaceuticals claim their medicine is "scientific" while natural medicine is "unproven." Sure it's scientific – about as scientific as the storyline in a Scooby Doo cartoon, or as credible as the medical license of a six-year-old kid who just received a "let's play doctor" gift set for Christmas. Many pharmaceutical researchers would have better careers as writers of fiction novels rather than scientific papers.

For all those people who ignorantly claim that modern pharmaceutical science is based on "scientific evidence," just give them these three words: Doctor Scott Reuben.

Drug companies support fraudulent research

Don't forget that the drug companies openly supported Dr. Scott Reuben's research. They paid him, in fact, to keep on fabricating studies.

The drug companies claim to be innocent in all this, but behind the scenes they had to have known what was going on. Dr. Reuben's research was just too consistently favorable to drug company interests to be scientifically legitimate. If a drug company wanted to "prove" that their drug was good for some new application, all they had to do was ask Dr. Reuben to come up with the research (wink wink). "Here's another fifty thousand dollars to study whether our drug is good for post-surgical pain (wink)."

And before long, Dr. Reuben would magically materialize a brand new study that just happened to "prove" exactly what the sponsoring drug company wanted to prove. Advocates of western medicine claim they don't believe in magic, but when it comes to clinical trials, they actually do: All the results they wish to see just magically appear as long as the right researcher gets paid to materialize the results out of thin air, much like waving a magician's wand and chanting, "Abra cadabra… let there be *Research Data*!"

Shazam! The research data materializes just like that. It all gets written up into a "scientific" paper that also magically gets published in medical journals that fail to ask a single question that might exposed the research fraud.

I guess these people believe in magic after all, huh? Where science is lacking, a little "research magic" conveniently fills the void.

The whole system makes a mockery of real science. It is a system operated by criminals who fabricate whatever "scientific evidence" they need in order to get published in medical journals and win FDA approval for drugs that they fully realize are killing people.

What is "Evidence-Based Medicine?"

The fact that a researcher like Dr. Reuben could so successfully fabricate fraudulent study data, then get it published in peer-reviewed science journals, and get away with it for 13 years sheds all kinds of new light on what's really behind "evidence-based medicine."

The recipe for evidence-based medicine is quite simple: Fabricate the evidence! Get it published in any mainstream medical journal. Then you can quote the fabricated evidence as "fact!"

When pushers of pharmaceuticals and vaccines resort to quoting "evidence-based medicine" as their defense, keep in mind that much of their so-called evidence has been entirely fabricated. When they claim their branch of toxic chemical medicine is based on "real science," what they really mean is that it's based on fraudulent science but they've all secretly agreed to call it "real science." When

they claim to have "scientific facts" supporting their position, what they really mean is that those "facts" were fabricated by criminal researchers being paid bribes by the drug companies.

"Evidence-based medicine," it turns out, hardly exists anymore. And even if it does, how do you know which studies are real vs. which ones were fabricated? If a trusted, well-paid researcher can get his falsified papers published for 13 years in top-notch science journals — without getting caught by his peers — then what does that say about the credibility of the entire peer-review science paper publishing process?

Here's what is says: "Scientific medicine" is a total fraud.

And this fraud isn't limited to Dr Scott Reuben, either. Remember: he engaged in routine research fraud for 13 years before being caught. There are probably thousands of other scientists engaged in similar research fraud right now who haven't yet been caught in the act. Their fraudulent research papers have no doubt already been published in "scientific" medical journals. They've been quoted in the popular press. They've been relied on by FDA decision makers to approve drugs as "safe and effective" for widespread use.

And yet underneath all this, there's nothing more than fraud and quackery. Sure, there may be some legitimate studies mixed in with all the fraud, but how can we tell the difference?

How are we to trust this system that claims to have a monopoly on scientific truth but in reality is a front for outright scientific fraud?

Keep up the great work, Dr Reuben

Thank you, Dr Scott Reuben, for showing us the truth about the pharmaceutical industry, the research quackery, the laughable "scientific" journals and the bribery and corruption that characterizes the pharmaceutical industry today. You have done more to shed light on the true nature of the drug industry than a thousand articles on NaturalNews.com ever could.

Keep up the good work. After paying your fine and serving a little jail time, I'm sure your services will be in high demand at all the top drug companies that need yet more "scientific" studies to be fabricated and submitted to the medical journals.

You may be a dishonest, disgusting human being to most of the world, but you're a huge asset to the pharmaceutical industry and they need you back! There are more studies that need to be fabricated soon; more false papers that need to be published and more dangerous drugs that need to receive FDA approval. Hurry!

Because if there's one place that extreme dishonesty is richly rewarded, it's in the pharmaceutical industry, where poisons are approved as medicines and fiction is published as the truth.

THE FLU CASE

Best and worst vaccination Bills in the US

The Flu Case, 18 February 2010, 12:03

https://web.archive.org/web/20100301035900/http://www.theflucase.com/index.php?option=com_content&view=article&id=2775%3Abest-and-worst-vaccination-bills-in-the-us&catid=1%3Alatest-news&Itemid=64&lang=en

US state vaccination bills that are causing concern:

New York: S4479, A6702: Health care practitioner may diagnose, treat or prescribe treatment for a sexually transmissible disease for a person under age eighteen without the consent or knowledge of his or her parents or guardians.

Kentucky HB 69 Would requires immunization against human papillomavirus for female children and require that parental statements to withhold consent be filed with the immunization certificate. Would also require educational resources to the public and all schools with special information. (In committee 1/29/10) X

New YorkA 3203 /S 1983 Would require that parents and guardians of a child in New York State be encouraged, through written educational materials and consultation, to be vaccinated against human papillomavirus (HPV); The measure also encourages voluntary, informed vaccination against human papillomavirus (HPV) for adults. (In committee)

Good bills to be modeled in other states:

Virginia HB 686 Would eliminate requirement for human papillomavirus vaccine for females. (In committee 1/13/10)

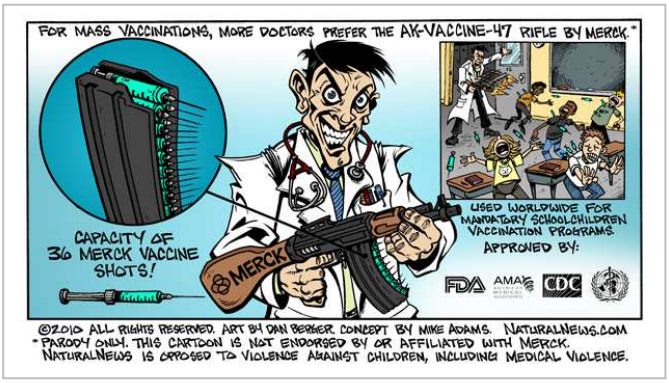
KansasHR 6019 Resolution would urge the U.S. Food and Drug Administration to use caution in approving new vaccines such as Gardasil which has had a number of health problems including some deaths associated with the use of this vaccine. (Recommended "do pass" from committee and sent to full House 4/2/09)

Mike Adams

Are mandatory vaccinations acts of violence against children?

Natural News, 20 February 2010
http://www.naturalnews.com/028215_vaccines_Merck.html

This article refers to the parody cartoon found at ... =>
https://www.naturalnews.com/Index-Cartoons.html



FOR MASS VACCINATIONS, MORE DOCTORS PREFER THE AK-VACCINE-47 RIFLE BY MERCK.
CAPACITY OF 36 MERCK VACCINE SHOTS!
MERCK
USED WORLDWIDE FOR MANDATORY SCHOOLCHILDREN VACCINATION PROGRAMS.

*PARODY ONLY. THIS CARTOON IS NOT ENDORSED BY OR AFFILIATED WITH MERCK.
NATURALNEWS IS OPPOSED TO VIOLENCE AGAINST CHILDREN, INCLUDING MEDICAL VIOLENCE.

More doctors prefer the AK-Vaccine-47 rifle by Merck (comic)
https://www.naturalnews.com/028211_vaccines_Merck.html

This parody cartoon grew out of the idea that vaccines are "shots" that are being increasingly forced upon children and teens. At times, these vaccines are enforced at gunpoint or with the presence of vicious guard dogs – as happened in Maryland two years ago when a court judge ordered thousands of parents to bring their children to court for vaccination or face gunpoint arrest and possible jail time

=> *Children herded like cattle into Maryland courthouse* for forced vaccinations as armed police and attack dogs stand guard - https://www.naturalnews.com/022267.html

Most modern vaccinations are, of course, a form of chemical violence against children. If they were all formulated without chemical preservatives (like thimerosal) and dangerous adjuvants (which can harm the nervous system), that might be a different story. But far too many of today's vaccines are chemical concoctions that are entirely unnatural to the human body. To force them into the bodies of innocent children is an act of medical violence.

The method of introducing the vaccines is unnatural and highly interventionist: These chemicals and DNA / RNA fragments are injected directly into the tissues and blood, bypassing the skin (a normal protective defense) and bypassing the digestive system, too. An injected mandatory vaccine dumps foreign material directly into the bloodstream of children w*ithout the consent of either the child or the parents* – that's what qualifies mandatory vaccines as "chemical violence" against children.

The Mad Doctor is in

The doctor in this parody cartoon was intentionally created to depict a "crazed" mad doctor because nothing turns an ordinary doctor into a mad man faster than an argument about vaccines. While he may seem to be a reasonable person on all other subjects, once you challenge him on the dangers of over-vaccination of children, all reason gets thrown out the window and he morphs into a raging lunatic of unscientific emotion.

The complete lack of scientific evidence supporting the safety and efficacy of vaccines makes no difference to him. "Vaccines need no science," he'll say, "Because everybody knows they work!"

My offer of $10,000 to anyone who can produce a scientific study proving the safety and effectiveness of H1N1 vaccines remains utterly

=> *$10,000 reward offered for scientific proof* of H1N1 vaccine safety and effectiveness
https://www.naturalnews.com/027985_H1N1_vaccines_safety.html

Vaccine failures are common

Meanwhile, in the real world vaccines are failing miserably. A recent outbreak of mumps in the New Jersey/New York area occurred almost entirely amongchildren who had already been vaccinated against mumps. I covered this story here:

=> *Mumps outbreak spreads among people* who got vaccinated against mumps
https://www.naturalnews.com/028142_mumps_vaccines.html

Clearly if vaccines really worked, then an outbreak should have only occurred among those who were NOT vaccinated against mumps, right? But as I reported here on NaturalNews, 77 percent of the children who got infected had already been vaccinated!

A similar truth emerges when you look at H1N1 deaths: Thousands of those who were vaccinated against H1N1 swine flu had already received the vaccine shots

=> Thousands of Americans died from H1N1 *even after receiving vaccine shots*
https://www.naturalnews.com/027956_H1N1_vaccine_CDC.html

We still don't know the exact number of how many vaccinated people died because the CDC is hiding that data from the public, making sure the mainstream media doesn't learn the truth that even many of those who were vaccinated still died.

What the CDC and its Big Pharma cohorts want people to mistakenly believe is that vaccines always offer protection against infectious disease. (100% protection). But this is blatantly false. In fact, because vaccines introduce aweakened virus into the body, they may hamper the normal immune response, creating systemic weakness that makes people more vulnerable to future infectious disease. In essence, weakened viruses create weakened immune responses, "training" the immune system to be more passive against future threats. That's why people who received vaccines in the past are far more likely to die of infectious disease in the future.

The Big Lie

Vaccine safety and effectiveness is "*the Big Lie*" of modern medicine in much the same that the WTC 7 building is "the Big Lie" of the war on terror. People who believe vaccines always work usually also believe the WTC 7 building was brought down by ordinary office fires.

Watch this video about WTC building 7: http://www.youtube.com/watch?v=8T2_nedORjw

Some people will believe anything

I've noticed a fascinating correlation between those who buy the official line on 9/11 and those who buy the official line on vaccines: These are the non-thinking people who are easily duped by anything the officials tell them. They could be told that the WTC 7 building was brought down by out-of-control office workers shooting rubber band guns in the hallway and they'd believe it!

For office fires to have brought down WTC 7 in such a perfectly organized, vertical collapse, do you realize that these fires would have had to somehow melt or destroy all the support columns of the entire building at almost exactly the same time?

That's the only way a building falls down vertically in such a controlled fashion: You have to blow out the support columns in a very carefully controlled split-second sequence. The odds of a fire accomplishing this are as close to zero as you can imagine... especially given that ordinary office fires don't even burn at the temperatures necessary to cause steel support beams to fail due to heat.

Watch this mini-documentary to learn more: http://www.youtube.com/watch?v=iEuJimaumW4

What the real Skeptics are asking right now

So what does WTC building 7 have to do with vaccines? They both serve as a simple test of intelligent skepticism.

The real Skeptics are the people who are skeptical of the official explanation of 9/11 and the cause of the collapse of WTC building 7. Real Skeptics are likewise skeptical of the vaccine-pushing agenda of the CDC and the drug companies. The real Skeptics think for themselves and ask intelligent questions like, "Why have no other steel buildings ever collapse from ordinary office fires in the history of the entire world?"

Or questions like, "*If human beings survived for hundreds of thousands of years without vaccines*, developing highly effective internal defenses against infectious disease, then why are vaccines all of a sudden being pushed so hard given that the human gene pool has hardly changed over the last 10,000 years?"

Or here's an even better question: "If avoiding vaccines is so dangerous, then why are nearly all the *children of anti-vaccine parents so amazingly healthy and intelligent*?" They're the smartest kids in the room. Meanwhile, all the really low-IQ kids tend to belong to parents who dutifully approve every vaccine shot they're told to subject their children to. (And they use antibacterial hand soaps at home, too, because they're suckers for any chemical that's marketed as "protecting kids from disease.")

The non-skeptics are people who believe whatever they're told by authority figures no matter how ridiculous the explanation. Here, you need these vaccines shots because without them you might die! Irradiate your body with mammography in order to prevent cancer! Don't take vitamins or nutrients because they might hurt you! Instead, swallow these chemical medications – they're GOOD for you!

These are just some of the ridiculous commands of the authorities who depend on suckers to buy into their falsehoods. There are a lot of suckers in the medical community, of course: In fact, you don't even get through conventional medical school unless you suspend the entire process of thinking for yourself. With very few exceptions, the very act of becoming a licensed, practicing doctor requires a near-complete surrender of all independent thought combined with outright obedience to the Cult of Pharmacology (and its conspirators like the FDA, CDC and WHO). State medical boards yank medical licenses away from any doctor who deviates from "the faith" of pharmaceuticals, chemotherapy, radiation and surgery. Merely recommending vitamin D to a cancer patient can get a doctor barred from practicing medicine. (Absolutely true.)

Vaccines make you easier to control

This same obedience to authority cults is what drives suckers into the arms of vaccine pushers. They're told to be obedient to vaccines, so they follow orders without a single skeptical question coming to mind. Once they actually receive more vaccine injections, this process becomes further self-reinforcing becausevaccine chemicals harm the nervous system, effectively suppressing cognitive function and making it more difficult for people to think for themselves. (This can usually be reversed, by the way, with nutritional detox therapies based on herbs and superfoods. So even if you were vaccinated in the past like I was, you can still "clean up" your system and restore healthy brain function.)

Once you combine the toxicity of vaccine adjuvants, chlorine in the water, BPA in plastics, non-stick cookware chemicals, antibacterial soaps and the chemicals in foods and medicines, you have a brain-numbing toxic stew that is now being spoon-fed to mainstream America. With their brains chemically suppressed by this onslaught of chemicals, most people find

Drastische Preissteigerung bei Grippe-Impfstoffen

Spiegel, 20 Februar 2010, 16:12 Uhr
https://www.spiegel.de/wissenschaft/medizin/pharmakonzerne-drastische-preissteigerung-bei-grippe-impfstoffen-a-679253.html

Preisexplosionen bei den Impfstoffen für die saisonale Grippe: Nach Informationen des SPIEGEL sind die Impfsubstanzen mehrerer Pharmakonzerne mehr als doppelt so teuer wie noch vor fünf Jahren. Die Begründungen der Hersteller für den heftigen Preisanstieg sind vage.

Hamburg - Alle reden über die Schweinegrippe - und dabei gerät aus dem Blickfeld, wie kräftig die Pharmabranche bei Impfstoffen gegen die saisonale Grippe zulangt. Nach Informationen des SPIEGEL sind seit 2005 die Preise für diese Impfstoffe drastisch gestiegen.

So verlangt etwa der Pharmakonzern Novartis für eine Zehnerpackung seines Impfstoffs Begrivac im Untersuchungszeitraum 109 Prozent mehr (Preis jetzt: 194,76 Euro), Solvays Influvac wurde innerhalb von vier Jahren 113 Prozent teurer (194,30 Euro), und der Generika-Hersteller Stada erhöhte den Preis für seinen Impfstoff seitdem um stattliche 120 Prozent (184,51 Euro).

Die Begründungen der Hersteller sind vage. Sie verweisen etwa auf eine angeblich "verstärkte Nachfrage" in der Bevölkerung, auch durch die Vogel- und Schweinegrippe. Zudem wird auf das hohe unternehmerische Risiko im hartumkämpften Grippeimpfstoffmarkt oder auf Investitionen in neue Anlagen abgestellt.

Bisher fallen solche Impfstoffe nicht unter die Festbetragsregelung, die eine Erstattungshöchstgrenze für bestimmte Arzneimittelgruppen festlegt. "Es ist völlig unverständlich, dass die Hersteller hier machen können, was sie wollen. Für Grippeimpfstoffe müsste es längst einen Festbetrag geben", sagt Ulrich Schwabe, Pharmakologe und Herausgeber des Arzneiverordnungsreports. anr

THE FLU CASE

Price of seasonal flu jabs more than doubles in five years, reports Der Spiegel

The Flu Case, 22 February 2010, 11:46
https://web.archive.org/web/20100301040103/http://www.theflucase.com/index.php?option=com_content&view=article&id=2799%3Aprice-of-seasonal-flu-jabs-more-than-doubles-in-five-years-reports-der-spiegel&catid=1%3Alatest-news&Itemid=64&lang=en

The price of vaccines against the seasonal flu has more than doubled in the last five years, according to a report in Der Spiegel.

It is not clear why the vaccine manufacturers have drastically increased the price, Der Spiegel says. Since 2005 Novartis has increased the price for a packet of ten Begrivac vaccines by 109% to 194.76 euros while Solvay's Influac has increased in price by 113% in four years.

Widely-used diabetes drugs can cause heart disease and death, warn experts

Refreshing News, 21 February 2010, 1:36 PM
http://refreshingnews9.blogspot.com/2010/02/widely-used-diabetes-drugs-can-cause.html

A diabetes drug used by tens of thousands of Britons increases the risk of heart disease and death, according to a new report. Up to 100,000 Britons with type 2 diabetes take the drug

Two US senators accused the makers of Avandia of attempting to keep evidence of the health risks from the public. The US Food and Drug Administration (FDA), the medicines safety watchdog, responded by asking an advisory committee to look again at the safety of the drug. The British equivalent, the MHRA, said it is continuously monitoring the safety of Avandia.

In a report, senators Max Baucus and Charles Grassley said the FDA had not banned the drug because it was too cozy with drugs firms. They quoted a memo written by two FDA reviewers which concluded: "The risks of (Avandia) are serious and exceed those for rival drug Actos." The reviewers said there was strong evidence that (Avandia) confers an increased risk of "heart attack and heart failure when compared to Actos.

Up to 100,000 Britons with type 2 diabetes take the drug, which carries a warning that it might not be suitable for those with heart problems. In 2007 a study published in the Journal of the American Medical Association, found Avandia puts users at a 60 per cent greater risk of heart failure and a 29 per cent greater risk of death than other medication.

Senator Baucus said: Americans have a right to know there are serious health risks associated with Avandia and GlaxoSmithKline had a responsibility to tell them. Patients trust drugs companies with their health and their lives and GlaxoSmithKline abused that trust.

A spokesman for GSK said it rejected the report's conclusions. The company said the report cherry-picks information from documents, which mischaracterises GlaxoSmithKline's comprehensive efforts to research Avandia and communicate those findings to regulators, physicians and patients.

It said it had rigorously studied Avandia's safety and "consistently shared this data with regulators around the world". The company said it "does not condone any effort to silence scientific debate".

Flu vaccine studies 'poor'

Irish Health, 21 February 2010, 17:40
http://www.irishhealth.com/article.html?id=16906 (deleteed)
https://web.archive.org/web/20100301040038/http://www.theflucase.com/index.php?option=com_content&view=article&id=2794%3Aflu-vaccine-studies-poor-irish-health-review&catid=1%3Alatest-news&Itemid=64&lang=en

(Irish Health) The evidence relating to the use of influenza vaccines in people over the age of 65 is poor, despite the fact that vaccination has been recommended for the prevention of flu in older people for the last four decades, scientists have said.

Adults aged 65 and over are considered one of the most vulnerable groups during flu season. As such, they are a priority for vaccination programmes. However, very few systematic reviews of the effectiveness of vaccines in this group have ever been carried out.

Cochrane researchers in Italy conducted a thorough search of studies based on previous vaccine trials. Randomised controlled trials (RCTs) are often considered the ‘gold standard’ of trials, but of the 75 studies included in their review, the researchers were only able to identify one recent RCT with ‘real’ outcomes.

In other words, this was the only RCT that used influenza cases as an outcome, as opposed to surrogate outcomes such as measurements of influenza antibodies in the blood.

All the other studies included in the review were deemed of low quality and open to bias.

According to the team, the limited reliable evidence from the studies suggests that the effectiveness of influenza vaccines is modest at best.

"Our estimates are consistently below those usually quoted by economists and in decision making. But until we have all available evidence, it is hard to reach any clear conclusions about the effectiveness of influenza vaccines in older people," said lead researcher, Tom Jefferson of the Cochrane Collaboration in Rome.

He said that as the evidence is so scarce at the moment, ‘we should be looking at other strategies to complement vaccinations’.

“Some of these are very simple things like personal hygiene and adequate food and water. Meanwhile, we need to undertake a high quality, publicly funded trial that runs over several seasons to try to resolve some of the uncertainties we're currently facing,” he added.

Details of these findings are published in the Cochrane Database of Systematic Reviews 2010.

Age of Autism

CDC on Vaccines and Autism Describes "Concerns" Not "Case Closed"

Age of Autism, 21 February 2010 at 05:45 AM
https://www.ageofautism.com/2010/02/cdc-on-vaccines-and-autism-describes-concerns-not-case-closed.html?cid=6a00d8357f3f2969e201310f255fcb970c

From the CDC website on Autism. It seems vaccines have not been ruled out, as the media and others continue to tell us. =>
https://web.archive.org/web/20100213100241/http://www.cdc.gov/ncbddd/autism/facts.html

Causes and Risk Factors

We do not know all of the causes of ASDs. However, we have learned that there are likely many causes for multiple types of ASDs. There may be many different factors that make a child more likely to have an ASD, including environmental, biologic and genetic factors.

Most scientists agree that genes are one of the risk factors that can make a person more likely to develop an ASD.

Children who have a sibling or parent with an ASD are at a higher risk of also having an ASD.

ASDs tend to occur more often in people who have certain other medical conditions. About 10% of children with an ASD have an identifiable genetic disorder, such as Fragile X syndrome, tuberous sclerosis, Down syndrome and other chromosomal disorders.

Some harmful drugs taken during pregnancy have been linked with a higher risk of ASDs, for example, the prescription drugs thalidomide and valproic acid.

We know that the once common belief that poor parenting practices cause ASDs is not true.

There is some evidence that the critical period for developing ASDs occurs before birth. However, concerns about vaccines and infections have led researchers to consider risk factors before and after birth.

ASDs are an urgent public health concern. Just like the many families affected in some way by ASDs, CDC wants to find out what causes the disorder. Understanding the risk factors that make a person more likely to develop an ASD will help us learn more about the causes. We are currently working on one of the largest U.S. studies to date, called Study to Explore Early Development (SEED). SEED is looking at many possible risk factors for ASDs, including genetic, environmental, pregnancy, and behavioral factors.

GlaxoSmithKline deliberately hid evidence of Avandia harm, says Senate report

Natural News, 23 February 2010
https://www.naturalnews.com/028233_GlaxoSmithKline_Avandia.html

GlaxoSmithKline, maker of the diabetes drug Avandia, knew the drug was linked to tens of thousands of heart attacks but went out of its way to hide this information from the public, says a 334-page report just released by the Senate Finance Committee. =>
https://web.archive.org/web/20100304102436/http://finance.senate.gov/press/Gpress/2010/prg022010a.pdf

This report also accuses the FDA of betraying the public trust, explaining that FDA bureaucrats intentionally dismissed safety concerns found by the agency's own scientists.

The report says that Big Pharma's drugs "put public safety at risk because the FDA has been too cozy with drug makers and has been regularly outmaneuvered by companies that have a financial interest in downplaying or under-exploring potential safety risks." Sales of Avandia were $3.2 billion (yes, billion) in 2006.

According to a statistical analysis in the report, if all the diabetics currently taking Avandia were put on a "safer" drug, it would avert 500 heart attacks and 300 cases of heart failure *every month* in the United States alone. Presently, hundreds of thousands of Americans are still taking this drug, and hundreds will continue to die each month as a result, according to the report estimates.

This report, championed by U.S. Senators Grassley and Baucus, is the result of investigators pouring through more than 250,000 pages of documentation gathered from GlaxoSmithKline and the FDA. The document reveals some rather startling facts about the dangers of Avandia, including evidence from the FDA's own scientists who concluded that Avandia was associated with 83,000 heart attacks.

GlaxoSmithKline intimidates scientists

This investigative report also reveals that GSK engaged in the intimidation of physicians, saying: "GSK executives attempted to intimidate independent physicians, focused on strategies to minimize or misrepresent findings that Avandia may increase cardiovascular risk and sought ways to downplay findings that a competing drug might reduce cardiovascular risk."

"Patients trust drug companies with their health and their lives, and GlaxoSmithKline abused that trust." said Sen. Baucus. (Gee, really? Is anyone really surprised that GSK put its own financial interests ahead of a few thousand human lives?)

A separate letter sent to FDA Commissioner Margaret Hamburg by Senators Baucus and Grassley added, "the totality of evidence suggests that GSK was aware of the possible cardiac risks associated with Avandia years before such evidence became public."

The FDA's own research also showed Avandia to be associated with a significant increase in heart attack risk, yet the FDA did nothing to protect the public. The agency's own scientists wrote in 2008, "There is strong evidence that rosiglitazone [Avandia] confers an increased risk of [heart attacks] and heart failure compared to pioglitazone [a rival drug on market]." This evidence went completely ignored at the FDA.

The FDA's famous Dr David Graham – the key whistleblower on the Vioxx scandal – concluded from his own research, "Rosiglitazone should be removed from the market."

Even the American Medical Association – a long-time defender of Big Pharma's drugs -- admitted Avandia was dangerous. Its journal, JAMA, wrote in 2007: "Among patients with impaired glucose tolerance or type 2 diabetes, rosiglitazone use for at least 12 months is associated with a significantly increased risk of myocardial infarction and heart failure, without a significantly increased risk of cardiovascular mortality."

The New England Journal of Medicine also warned about the safety of the drug in an article published in 2007.

Despite these multiple warnings, an FDA panel voted 22 - 1 in favor of keeping Avandia on the market. This is no surprise, of course, to those who know how the FDA really operates (and where its priorities really lie).

Analysis: What does it all mean?

Are you kidding me? A drug company hid data that its high-profit drug was linked to increased risk of heart attacks? A drug company intimidated physicians and got away with hoodwinking the public while raking in billions of dollars in sales for a drug that the FDA's own scientists said should be pulled from the market?

Sounds like *business as usual* at the FDA, the "sweep it under the rug" division of the pharmaceutical industry. Once again, Dr David Graham turns out to be the sharpest guy in the room while having the courage to tell the truth even when surrounded by an agency full of morons and criminals.

The drug industry must hate this guy. But they can't get rid of him because he's one of the very few scientists in the FDA who is actually committed to *protecting the public*. Gee, what a concept, huh? The FDA as a whole abandoned that idea so long ago that virtually nobody there even remembers what it means. Protect the public? What do you mean? As in, *lose profits* by banning dangerous drugs that just happen to be making big money?

That's unthinkable at the FDA as we know it today. The agency exists *to promote pharmaceuticals*, not to limit their sales just because a hundred thousand people happen to drop dead each year from taking FDA-approved drugs.

When it comes to safety vs. profits, the FDA chooses profits for Big Pharma time and time again.

Do the math on this: If Avandia is linked to 83,000 heart attacks, and if roughly 50% of those are fatal (that's just an estimate), then Avandia could conceivably be the cause of **40,000 deaths**. The terrorist attacks of 9/11 killed roughly 3,000 Americans, and yet just one drug that has been mysteriously kept on the market by the FDA appears to have killed **more than ten times as many**

Americans as the terrorists.

So what does that make the FDA? More dangerous than the terrorists, of course!

So why is the FDA still allowed to operate in America if it's such a dangerous organization that's killing so many American citizens? *Because it's profitable, of course!*

There's one thing that's true about both WAR and MEDICINE: As long as the right corporations are making money, it really doesn't matter how many people die in the process.

And for all those diabetic Americans struggling to find improved health right now, there's something you desperately need to know: There's a price to putting your faith in the FDA, the drug companies and your pill-pushing doctor. That price may very well be your own life.

Diabetes has a cure, you know. You can reverse it in as little as four days by changing your diet.

Here's the full report from the U.S. Senate (PDF):

The Washington Post

Mike Stobbe

Panel recommends annual flu vaccinations for all

Washington Post // The Associated Press, 24 February 2010, 8:52 PM
http://www.washingtonpost.com/wp-dyn/content/article/2010/02/24/AR2010022404361_pf.html
(deleted)

ATLANTA – A government panel is now recommending that virtually all Americans get a flu shot each year, starting this fall.

The Advisory Committee on Immunization Practices had gradually been expanding its recommendation for flu shots - 85 percent of Americans were already included.

On Wednesday, the panel voted to recommend a seasonal flu vaccination for everyone except babies younger than 6 months and those with egg allergies or other unusual conditions.

The panel's recommendation now goes to the Centers for Disease Control and Prevention. The CDC usually follows the panel's advice and spreads the message to doctors and hospitals across the country.

"Now no one should say 'Should I or shouldn't I?'" said Dr. Anthony Fiore, a CDC flu specialist.

CDC vaccination recommendations tend to be influential with the doctors who give the shots and the health insurers who pay for them.

Flu shots are already recommended for 85 percent of the U.S. public, including pregnant women, children older than 6 months, adults 50 and older, people with certain chronic health conditions, health care workers and those who take care of people in a recommended group. The only people who weren't specifically included were healthy people ages 19 to 49 who don't have close contact with anyone at risk of flu and its complications.

But only about 33 percent of Americans actually get a flu shot, and unusually millions and millions of doses get thrown away annually.

The swine flu pandemic that hit last year caused a new momentum for flu vaccinations. Virtually all the 114 million doses of seasonal flu vaccine doses made were distributed, and more young adults and children got the swine flu vaccine than usually come out for seasonal flu.

The panel voted 11 to 0 - with one abstention - for the recommendation, prompting a short round of applause in the CDC auditorium where the meeting was held. Some public health experts and physicians had been pushing for a universal flu vaccination recommendation for more than 10 years.

Also on Wednesday, the panel gave its nod to a proposed formulation of next year's seasonal flu vaccine. The vaccine will be built to protect against three strains of flu scientists think will be circulating next fall and winter. Swine flu is to be one of the strains incorporated into the vaccine.

At past meetings, the panel stopped short of recommending flu shots for everyone. Panel members were mindful of a history of temporary flu vaccine shortages in the United States. They worried a universal recommendation might cause demand to far surpass supply and endanger those at the highest risk of life-threatening flu complications.

"Yet every year we wasted millions and millions of doses," said Dr. Gregory Poland, a Mayo Clinic infectious diseases expert who for years has passionately pushed the panel to recommend flu shots for all.

The swine flu vaccine campaign appears to be ending the same way. Doses were scarce when the swine flu vaccine first became available in early October, but now roughly 90 million people have been vaccinated, demand is dying and millions of doses are unused.

Swine flu provided another argument for universal vaccination. The new virus proved to be unusually dangerous to young adults, and also took a surprising toll on Native Americans and obese people. Many of those hospitalized and killed by swine flu were not in groups previously recommended for annual flu shots, and that fact was another reason to expand the vaccination recommendation, experts said.

There are a few exceptions to the universal recommendation. Children under 6 months of age, who have undeveloped immune systems, will continue to be exempt. So too will people who have egg allergies (the vaccine is made using eggs) and those who have had certain severe reactions to flu shots in the past.

The panel also decided that elderly people can consider a new, revved-up version of the seasonal flu shot. It's a Sanofi Pasteur vaccine for adults 65 and older.

In years when the flu shot is well matched to circulating flu viruses, vaccine is 70 to 90 percent effective in people younger than 65, the CDC estimates. But it tends to be only 30 to 70 percent effective in those who are older because they generally have weakened immune systems.

The Sanofi vaccine – called Fluzone High-Dose - has four times as much immunity-building antibodies as a standard dose. The U.S. Food and Drug Administration approved the vaccine in December, and it should be available for the 2010-2011 flu season. It would cost about $25 a shot, or about twice the standard version

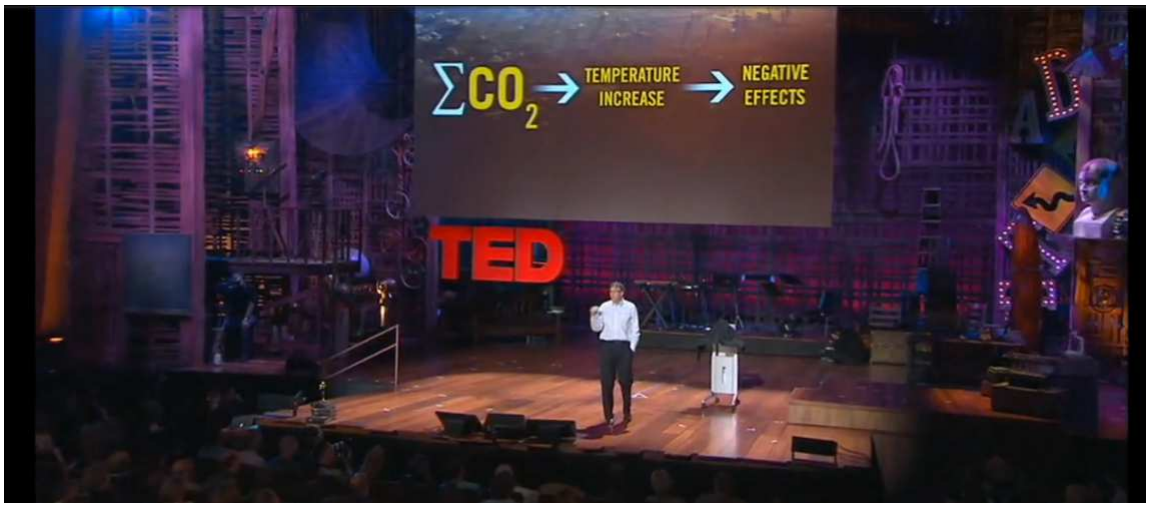
TED Ideas change everything

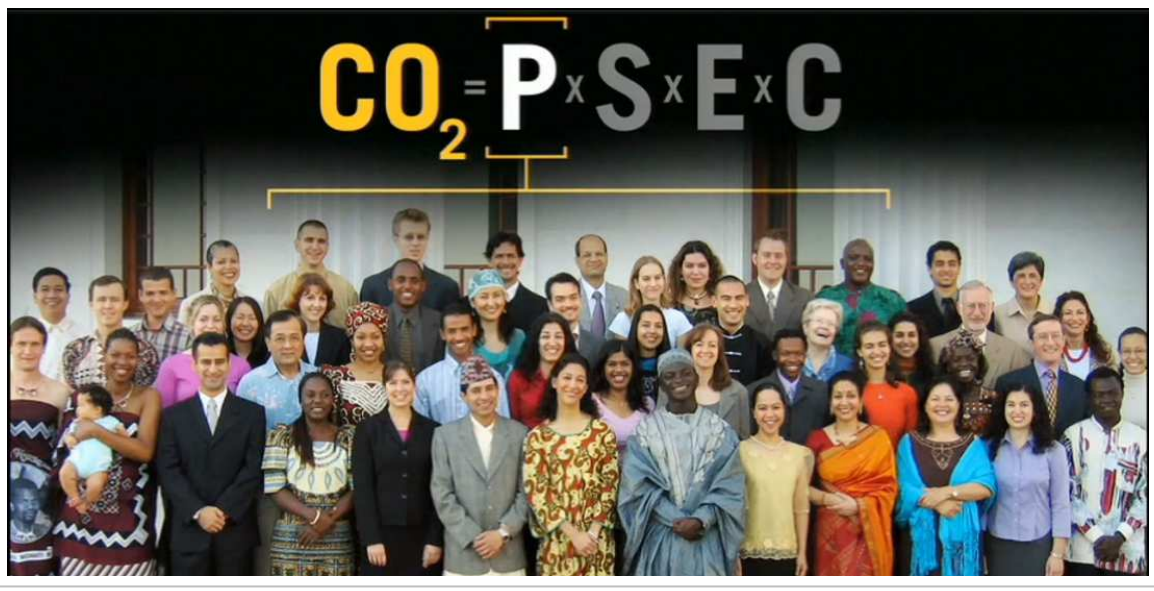
... they said: **"Bill Gates wants a Billion Dead!"**
Vaccines and Health Care will do the Job!

TED, 28 February 2010
https://web.archive.org/web/20101010141706/https://www.youtube.com/watch?v=WUJMR3BUm2s
https://www.ted.com/talks/bill_gates_innovating_to_zero?language=en

"The world today has 6.8 billion people. That's heading up to about nine billion. Now if we do a really great job on new vaccines, health care, reproductive health services, we could lower that by perhaps 10 or 15 percent!" [About 1 Billion People!]

2010 TED ... talk on ways to reduce climate emissions, the wealthy entrepreneur acknowledged the population factor and stated we could reduce this "if we do a really great job on new vaccines, healthcare, reproductive health services."





Paul Joseph Watson

Bill Gates: use Vaccines to Lower Population

Prison Planet, 1 March 2010
https://www.youtube.com/watch?v=JaF-fq2Zn7I
https://web.archive.org/web/20100511051537/http://www.theflucase.com/index.php?option=com_content&view=article&id=2876%3Avaccines-can-be-used-to-lower-populations-says-vaccine-funder-bill-gates&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Microsoft founder Bill Gates told a recent TED conference, an organization which is sponsored by one of the largest toxic waste polluters on the planet, that vaccines need to be used to reduce world population figures in order to solve global warming and lower CO2 emissions.

Stating that the global population was heading towards 9 billion, Gates said, "*If we do a really great job on new vaccines, health care, reproductive health services (abortion), we could lower that by perhaps 10 or 15 per cent*." [4:32 - 4:50]

Quite how an improvement in health care and vaccines that supposedly save lives would lead to a lowering in global population is an oxymoron, unless Gates is referring to vaccines that sterilize people, which is precisely the same method advocated in White House science advisor John P. Holdren's 1977 textbook Ecoscience, which calls for a dictatorial "planetary regime" to enforce draconian measures of population reduction via all manner of oppressive techniques, including sterilization.

"I'm not sure what the nothing-to-see-here explanation is for Bill Gates' theory that "new vaccines" can help lower the population of the world," points out the Cryptogon blog, "But I thought about the incidents from the 1990s where the World Health Organization was providing a "tetanus vaccine" to poor girls and women (and just poor girls and women) that contained human chorionic gonadotrophin (hCG). For those who don't want to delve into that, in short, it was a World Health Organization experiment; a test of a vaccine against pregnancy."

After presenting an equation that included the number of people on the planet and CO2 emissions, Gates said, "Probably one of these numbers is going to get pretty near to zero."

Later in the presentation, Gates mentions picking a vaccine, "which is something I love," that would be used to lower global CO2 emissions.

He also advocates pouring more money into the global warming scam by way of the United Nations, as well as a "CO2 tax" and cap and trade, while making it clear that the developed world would have to reduce its living standards by cutting back on essential services that generate CO2.

Gates said that a 20 per cent reduction in CO2 emissions was necessary by 2020, a 50 per cent reduction by 2050, and ultimately that there had to be zero CO2 emissions globally, a measure that would completely reverse hundreds of years of technological progress and return man to the agrarian age, all in the name of preventing an alleged miniscule temperature increase that has been proven to be based on fraudulent data models in light of the Climategate scandal.

One of Gates' proposals for reducing CO2 emissions is the use of biofuels, which as a new report highlights, has resulted in millions of acres of forests being destroyed, which ultimately means a net increase in CO2 emissions from biofuels when compared to fossil fuels, not to mention the massive devastation caused to wildlife.

As we have documented, a CO2 reduction of 50-80 per cent, not to mention 100 per cent, would inflict a new great depression in the United States, reducing GDP by 6.9 percent – a figure comparable with the economic meltdown of 1929 and 1930.

Additionally, the "post-industrial revolution" being proposed by Gates and his ilk would lead to massive job losses.

The implementation of so-called "green jobs" in other countries has devastated economies and cost millions of jobs. As the Seattle Times reported back in June, Spain's staggering unemployment rate of over 18 per cent was partly down to massive job losses as a result of attempts to replace existing industry with wind farms and other forms of alternative energy.

In a so-called "green economy," "Each new job entails the loss of 2.2 other jobs that are either lost or not created in other industries because of the political allocation – sub-optimum in terms of economic efficiency – of capital," states the report.

The fact that Gates would be so open in his call to use vaccines to lower global population (without a word as to the human rights considerations), probably has a lot to do with the audience attending his speech.

The TED organization admits that it is elitist, "in a good way," and charges a whopping $6,000 dollars membership fee which must be paid by conference attendees. TED also charges nearly $1,000 just for its live conference web stream. The organization's sponsors include IBM and military-industrial complex kingpin General Electric, which has a notorious history of environmental misdeeds, being ranked fourth-largest corporate producer of air pollution in the United States, with more than 4.4 million pounds per year (2,000 Tonnes) of toxic chemicals released into the air. GE is also a major contributor to the toxic waste problem, rendering its sponsorship of an organization that claims to be seeking solutions to environmental problems completely

Merck's cervical cancer vaccine ads are inaccurate and misleading

Natural News, 3 March 2010
https://www.naturalnews.com/028286_Merck_advertising.html

Several doctors and women's groups in India are lambasting advertisements puts out by drug giants GlaxoSmithKline (GSK) and Merck for their human papilloma virus (HPV) vaccine. Objecting to the claims being made that the vaccine protects against cervical cancer, The Sama Resource Centre for Women and Health, Saheli Women's Resource Centre, and a group of doctors are sounding the alarm that the ads are misleading and inaccurate.

Marketed in the United States as Gardasil, the HPV vaccine is being touted by its manufacturers as the greatest thing since sliced bread as far as preventing cervical cancer. Even in India, the marketing campaign for the vaccine has been so successful that pediatricians all over the country are urging parents to have their adolescent daughters vaccinated.

Budev Chandra Das, a professor of biomedical research at Delhi University, and Dr. Sidharth Sahni, a surgical oncology consultant at Artemis Health Institute, have both been questioning the legitimacy of the vaccine, noting that there are many different types of HPV that the vaccine does not prevent and that there are other conditions that cause cervical cancer besides HPV.

The vaccine is allegedly only effective on young girls who have never had sex, another important piece of information that doctors and researchers are saying GSK and Merck have failed to effectively communicate. Rather than divulge the truth of the matter, the two drug companies seem only to be interested in convincing as many people as possible to get the vaccine.

Vani Subramaniam from the Saheli Women's Resource Centre also pointed out that the drug giants have concealed the truth about the many horrific side effects caused by the vaccine. Merck's public list of Gardasil's side effects include headache, fever, vomiting, fainting, breathing problems, seizures, chronic fatigue, chest pains, and stomach pain, just to name a few.

Many young women and girls in the U.S. have developed severe, debilitating conditions after receiving their Gardasil shots. Aside from the known side effects, some girls have become paralyzed while others have developed chronic illness that has left them unable to function properly. Many girls have actually died from receiving Gardasil shots.

The harm caused by Gardasil is obscene, leaving one to wonder how such a dangerous product can continue to be marketed and sold legally with no repercussions on the villains who are perpetrating it on the public. Not only is the vaccine a failure at accomplishing its stated purpose, but it continues to destroy the lives of the next generation of young girls who receive it.

The research unit NANEA should have been the best in the world. Today the slogans have died; the group has disintegrated; and the head of it all has run away to the USA following suspicions of fraud for millions. And the funky villa that housed the dream is empty and deserted.

“I am ready to kill to make my way”.

The sentence touches a nerve in Anja, when she listens to her boss talking about the ambitions that drive his career. For one thing he is joking, but jokes and seriousness are, as it is well known, complementary quantities, and Anja has seen and heard it all before. For many months she worked at the research unit NANEA at the University of Aarhus. During that time she experienced her chief say openly he is willing to sacrifice friendship for his job, and that he does not care whether there are more qualified candidates if he himself is getting there first.

Anja has seen what happens when a new article is ready for publication and the researchers are fighting about the order of names in the byline of the article.

As time goes by Anja is also aware that she is not thriving in that game, and that her career must take another turn.

Dogs Today... Humans Tomorrow

DProgram World Press, 13 March 2010
https://dprogram.wordpress.com/2010/03/13/dogs-today-humans-tomorrow-david-icke/

The technique that I call the Totalitarian Tiptoe can clearly be seen with regard to the agenda for mass human microchipping.

To come out of nowhere and seek to impose compulsory microchipping at birth would be many steps too far and too quick for public acceptance and so, as with most of the Control System, it is done in increments, like adding strands one at a time and building a web by stealth.

First they had to introduce the principle of microchipping and get people used to it. Once it becomes a norm at one level they move on to the next. The prime means of doing this has been the microchipping of animals, especially dogs, which was introduced as a voluntary scheme – 'microchip your dog and you'll never lose Fido again'.

Now we are seeing the next stage – exactly the sequence planned for humans – in which dogs in the UK, and then further a field, are to be subjected to compulsory microchipping, according to government proposals announced this week …

… The human microchip will allow the population to be tracked every minute of their lives and there would never be a single second in a lifetime when the authorities would not know where you were. It is about more than just surveillance, however.

Even most of those who are aware of the microchipping agenda think it's all about surveillance, and on one level it is, but only by understanding the true nature of reality and the human body can the even more sinister aspects of the microchipping agenda be seen. The body is a biological computer and they want to implant the microchip to hijack its electrochemical systems and control every human being mentally, emotionally and physically

(If we are stupid enough to allow it)

Hello all ...

The technique that I call the Totalitarian Tiptoe can clearly be seen with regard to the agenda for mass human microchipping.

To come out of nowhere and seek to impose compulsory microchipping at birth would be many steps too far and too quick for public acceptance and so, as with most of the Control System, it is done in increments, like adding strands one at a time and building a web by stealth.

First they had to introduce the principle of microchipping and get people used to it. Once it becomes a norm at one level they move on to the next.

The prime means of doing this has been the microchipping of animals, especially dogs, which was introduced as a voluntary scheme - 'microchip your dog and you'll never lose Fido again'.

Now we are seeing the next stage - exactly the sequence planned for humans - in which dogs in the UK, and then further a field, are to be subjected to compulsory microchipping, according to government proposals announced this week.

The problem for which this 'solution' is being imposed are 'dangerous dogs' who bite and attack people, not least children. But instead of targeting the truly dangerous dogs and irresponsible owners, this is, as usual, a blanket assault on all dog ownership.

The problem caused by the few – but the solution for everyone.

This is because the motivation is not to protect the population from dangerous dogs (many of which are now being bred specifically to be dangerous) but to install the precedent for compulsory microchipping and to create a whole new level of bureaucratic control and taxation.

The British government plan involves a vast bureaucracy of enforcement officers, microchip scanners, dog pounds for seized animals, a database of every dog in the country and compulsory dog insurance for every owner.

All this will be paid for by the owners which include the overwhelming majority who have docile dogs and have never been any trouble to anyone, nor will be. We are seeing this technique ever more blatantly across society now where a problem posed by the very few leads to draconian laws imposed on everyone.

The immediate introduction of full-body scanners after the guy set his pants on fire in a plane over Detroit is a classic. He was allowed on the plane without a passport because US Intelligence gave the go ahead and as a result of what subsequently happened air passengers are to be subjected to a dose of radiation and a picture of their naked body every time they want to board a plane.

The reason for the increasingly obvious manipulation of such events is because the Control System is behind the planned time-scale for the global Big Brother State and its servants have to push on using more and more flimsy excuses.

We are going to see the same with the human microchipping agenda, too. When I first wrote about the plan to microchip the global population it was thought by most people to be a wild exaggeration or science fiction nonsense.

The very suggestion that we were heading for microchipped people was guaranteed to elicit guffaws and belly laughs. But not any more. Today it is happening.

Microchipping babies at birth is the goal of the bloodline families to ensure that no-one comes into this reality in human form without being connected to the global computer network and the Global Positioning System (GPS) which is there to monitor everyone on the planet via satellite.

The microchip will allow the population to be tracked every minute of their lives and there would never be a single second in a lifetime when the authorities would not know where you were. It is about more than just surveillance, however.

Even most of those who are aware of the microchipping agenda think it's all about surveillance, and on one level it is, but only by understanding the true nature of reality and the human body can the even more sinister aspects of the microchipping agenda be seen.

The body is a biological computer and they want to implant the microchip to hijack its electrochemical systems and control every human being mentally, emotionally and physically.

Once microchipped, people can be made to think, or not think, whatever the signals decide, and the same can be done with emotions. Microchipped people can be manipulated to be aggressive or submissive, sexually high or sexually suppressed, and made to feel extreme fear at the touch of a button or the click of a mouse.

Then there is the little matter of having the ability to kill you from a distance via the chip if ever you make waves and refuse to be a good little slave. This can be done directly through the chip or it can transmit your exact location for a 'clean' ass.

Ex-Pfizer worker cites genetically engineered virus in lawsuit over firing

Hartford Courant, 14 March 2010
https://www.courant.com/2010/03/14/ex-pfizer-worker-cites-genetically-engineered-virus-in-lawsuit-over-firing/

Medical experts will be watching closely Monday when a scientist who says she has been intermittently paralyzed by a virus designed at the Pfizer laboratory where she worked in Groton opens a much anticipated trial that could raise questions about safety practices in the dynamic field of genetic engineering.

Organizations involved in workplace safety and responsible genetic research already have seized on the federal lawsuit by molecular biologist Becky McClain as an example of what they claim is evidence that risks caused by cutting-edge genetic manipulation have outstripped more slowly evolving government regulation of laboratories.

McClain, of Deep River, suspects she was inadvertently exposed, through work by a former Pfizer colleague in 2002 or 2003, to an engineered form of the lentivirus, a virus similar to the one that can lead to acquired immune deficiency syndrome, or AIDS. Medical experts working for McClain believe the virus has affected the way her body channels potassium, leading to a condition that causes complete paralysis as many as 12 times a month.

"If a worker in a plant as sophisticated as Pfizer is becoming infected with a genetically engineered virus, then I think the potential is everywhere," said Jeremy Gruber, president of the Council for Responsible Genetics, a public interest group created to explore the implications of genetic technologies.

"Genetically engineered viruses are commonly worked on at your average university," Gruber said. "The public has a right to know what regulations are in place and what regulations are required to fix an industrywide issue. We need to have a conversation about this. Ms. McClain's attempt to do that has been hampered at every turn, by the courts and by regulators."

Pfizer disputes all of McClain's claims and says it fired her in 2005 because she refused to come to work. The global pharmaceuticals manufacturer, with research labs in southeastern Connecticut, defends its safety practices and denies that McClain's physical disability is related to exposure at its Groton lab. The company says she did not link her disability to workplace exposure until after she was fired.

As a molecular biologist, McClain studied cells on a molecular level, manipulating genetic codes in an effort to develop vaccines. During the period at issue in the suit, McClain worked in Pfizer's Human Health Embryonic Stem Cells Technologies, Genomic and Proteomic Sciences and Exploratory Medicinal Sciences Group.

Hostile Exchanges

The sharp disagreement between McClain and her former employer mirrors a half-dozen or so years of hostile litigation leading to Monday's jury trial in Hartford before U.S. District Judge Vanessa L. Bryant. McClain will argue that she was wrongfully dismissed and is entitled to unspecified damages. In the run-up, Pfizer attacked McClain's legal claims, and she questioned the company's corporate integrity.

On the advice of her lawyers, McClain would not discuss her suit last week. Neither would her lawyers, nor those representing Pfizer.

But McClain has claimed in her suit and in earlier public statements that she was fired after experiencing symptoms of illness and after complaining to the U.S. Occupational Safety and Health Administration about safety in her Pfizer lab.

OSHA dismissed McClain's complaint. In a decision published after McClain's termination, the agency criticized her for refusing to return to work in spite of "Pfizer's substantial efforts" to address her concerns. In a speech last year to a labor safety group in California, McClain said she was told by an OSHA investigator that the federal agency's legal authority has not kept pace with developments in sophisticated medical research.

A series of angry, pretrial exchanges developed over McClain's efforts to compel Pfizer to give her precise information about the DNA sequencing of the engineered lentivirus she suspects infected her. Pfizer says it responded to all of McClain's requests, in accordance with the law. Her advocates called Pfizer's assertion preposterous and claimed the company has not produced – perhaps because it is subject to trademark – the sequencing data that could enable scientists to engineer a genetic cure.

Over the course of pretrial argument, the number and breadth of McClain's legal claims against Pfizer have been reduced from eight to two. Last month, Bryant dismissed the most significant of the eight claims: that willful and wanton misconduct by Pfizer resulted in lax laboratory procedures. McClain claimed laxity contributed to her exposure.

McClain's advocates point to language in Bryant's ruling that suggests the misconduct allegation was dismissed, at least in part, because state law requires such claims to be resolved by state workers' compensation rules. But Pfizer says Bryant's ruling is another vindication of its assertion that no evidence exists to support McClain's contention that she was infected by a viral exposure at Pfizer.

"We have thoroughly investigated Ms. McClain's claims and our investigation concluded that her workplace was safe and that she was not infected by any virologic materials while she was employed by Pfizer," company spokeswoman Elizabeth Power said.

Bryant's ruling means the trial will move forward under McClain's two remaining claims, both of which involve free speech protection. She says Pfizer fired her in violation of Connecticut's whistle-blower law after she raised questions about Pfizer lab safety to OSHA. And she claims her dismissal also was in retaliation for questions she raised in discussion with Pfizer colleagues about safety practices. In addition to performing her research duties, McClain served on a lab safety committee for at least part of the nine years she was employed by Pfizer.

Medical Evidence

Pfizer has taken the position that Bryant's ruling in March means no evidence will be admitted at the trial concerning McClain's health or her claim that it was destroyed by bad lab procedures. McClain's advocates, again, disagree. Because McClain is suing under a whistle-blower claim, they believe she will be allowed to present evidence about why she figuratively blew the whistle. If her health and safety are the reasons, they say, the judge could allow jurors to hear evidence in those areas.

In her suit, McClain says that Pfizer hired her in 1995 and that, in 2000, she became involved in human cellular research associated with vaccine development. She later learned, the suit says, that colleagues in her lab were working with infectious, genetically engineered viruses, including the lentivirus she suspects causes what her physician calls "acute intermittent paralysis."

The suit describes lab events that McClain suggests could have infected her.

The first involved the possible malfunction of a "laminar hood," a system designed to contain materials being subjected to scientific manipulation and to purify the air circulating around the

materials. She said the hood began emitting a noxious odor at the same time she and several colleagues developed symptoms of illness, including nausea.

McClain said in the suit that, as a member of the lab safety committee, she reported the apparent hood malfunction. Judge Bryant said in a preliminary ruling that Pfizer took "various steps" to fix the hood and ultimately replaced it, twice.

Pfizer contends that the hood problem was resolved eight months after McClain reported it. But a long e-mail message by one of McClain's supervisors and the OSHA review corroborate McClain's contention that the problem persisted for a year. Before it was corrected, several people suffered from headaches, vomiting and nausea, including at least one member of the crew that cleaned the lab after work.

About two months after the hood problem was resolved, McClain says in the suit, she learned from a colleague that he was working "next to" her on "dangerous lentivirus material and embryonic stem cells." The work was being done on an open lab bench, unprotected by a biological containment system, the suit says, even though lentivirus work should have been done only under a protective "biological hood."

"I was shocked and appalled to find he had been using lentivirus materials on an open lab bench without biocontainment where I performed my office work (e.g. without gloves) in October 2003," McClain wrote in a legal filing.

On another occasion, she says, she encountered an unidentified experimental set-up consisting of cell cultures on her laboratory bench, but she cannot recall whether she touched it.

Pfizer has responded that any lentivirus studied in lab areas where McClain was present was not derived from a human infectious virus and was not infectious because it lacked genes for replication.

McClain says in the suit that she repeatedly raised laboratory safety issues following the hood malfunction, despite a warning from a supervisor that doing so could jeopardize her employment. She said she began suffering from "fatigue, suspicion of multiple sclerosis, joint pain, and numbness in her face as well as sleep difficulties" and took a medical leave in February 2004. She was fired about 11 months later.

The suit contends the dismissal was retaliation for her complaints about safety. In a speech a year ago, McClain asserted that some of the safety deficiencies she has criticized are the product of poor lab design – design that is nonetheless acceptable under OSHA rules.

Pfizer contends that McClain's dismissal was not related to her concern about safety. Rather, the company says, she was terminated for refusing to report back to work after the company made her repeated offers, including alternative employment opportunities, some in laboratories other than the one about which she had complained. Pfizer claims McClain was told in advance of her termination that she would be fired if she didn't return to work.

Even though jurors are unlikely to hear arguments that McClain's potassium disorder and related transient paralysis are attributable to exposure to an engineered virus, a network of laboratory safety advocates already is using the case as a rallying point. A group from San Francisco has planned a press conference outside the Hartford courthouse on Main Street at 12:15 p.m. Monday.

They say OSHA's inability to stay abreast of developments in sophisticated, molecular research techniques – as well as law protecting the confidentiality of proprietary discoveries – has neutralized the agency's ability to act as an effective regulator.

"This case shows a major flaw for workers in the biotech industry who have to prove where they got injured in order to receive workers' compensation," said Steve Zeltzer, one of the organizers.

Age of Autism

Mark Blaxill on Industry Corruption of Scientific Journals: Is Something Rotten in Denmark?

Age of Autism, 22 March 2010, 16:56
https://www.ageofautism.com/2010/03/is-something-rotten-in-denmark.html

Several years ago, at the invitation of a journal editor interested in the issue of industry corruption of scientific journals, I drafted an article on the Denmark epidemiology studies. I had just published a couple of articles on autism in other journals and was interested in making additional contributions. I was outraged that the sponsorship of the Danish publications had been spearheaded by the company that manufactured the thimerosal-containing vaccines investigated for their connection to autism and astonished that this connection had received no attention whatsoever. I did a simple analysis of the social network of authorship to show that a single collaboration was behind the entire publication program, wrote up the results and sent a first draft back to the journal.

The peer reviews that came back were constructive and helpful, but also argued for some pretty extensive revisions. The changes had little to do with the conflict of interest argument and mostly involved relatively arcane issues of network analysis and asked me to explain some of the technical choices I had made and how the results of these technical choices should be interpreted. When I got the feedback, I was quite busy on other projects and had begun losing my enthusiasm for running the publication gauntlet at academic journals. As a result, I gave up on the effort and never responded to the suggestions.

As the scandal involving Poul Thorsen's misrepresentation of his employment and possible misappropriation of funds, it seemed to me that this analysis took on new relevance. So we have decided to run my original draft here in its entirety. We hope that you'll read it understanding its original intent and in a spirit of forgiveness for its shortcomings.

THE FLU CASE

Mark Blaxill on Industry Corruption of Scientific Journals: Is Something Rotten in Denmark?

https://web.archive.org/web/20100325184819/http://www.theflucase.com/index.php?option=com_content&view=article&id=3107%3Amark-blaxill-on-industry-corruption-of-scientific-journals-is-something-rotten-in-denmark&catid=1%3Alatest-news&Itemid=64&lang=en

Mark F. Blaxill, M.B.A.

Is something rotten in denmark?

A social network analysis of conflict of interest in vaccine safety research

Short title:

Commercial conflicts in vaccine safety research

Rescue Post, 2010
https://cijepljenje.info/files/files/is-something-rotten-in-denmark-rev.pdf
https://www.rescuepost.com/files/is-something-rotten-in-denmark-rev.pdf

Abstract

Three papers based on a Danish patient registry argued against a link between mercury-containing vaccines and autism. Following a related analysis of the autism-MMR vaccine link, these studies were published in close succession in prestigious journals, based on marginally differentiated analyses of the same events and prepared by author groups with numerous connections.

Analysis of these publications, their authors and sponsoring institutions reveals a social network with extensive personal and institutional ties. Analysis of the authors and their employers also reveals a pervasive conflict of interest that was not reported in the publishing journals.

All authors in the network have ties, direct or indirect, to a for-profit, state-owned, vaccine manufacturer: the Statens Serum Institut (SSI). The mercury-containing vaccine investigated in the three studies was produced by SSI. Six SSI employees participated as co-authors in studies in which the safety of SSI products were evaluated. These six individuals also hold central positions in a broader network with ties to eleven additional authors and maintain formal alliances at the institutional level.

SSI has a commercial interest in vaccine products: the vaccine division contributed half of SSI's revenues and over 80% of profits in 2002; vaccine exports were SSI's fastest growing business; mercury-containing vaccine products support SSI's vaccine exports; and SSI provides ingredients for mercury-containing vaccines currently used outside Denmark.

SSI has a conflict of interest in conducting assessments of vaccine safety. This conflict should be considered when evaluating the authors' findings that mercury in Danish vaccines did not cause harm.

REUTERS

Switzerland suspends Glaxo's rotavirus vaccine

Reuters, 24 March 2010, 2:50 AM GMT+8
https://www.reuters.com/article/idUSLDE62M2G620100323/

ZURICH, March 23 (Reuters) – Switzerland has urged doctors to temporarily stop using GlaxoSmithKline Plc's (GSK.L) Rotarix vaccine, regulators said on Tuesday, making it the latest country to caution against its use.

U.S. authorities and the company said on Monday doctors should temporarily stop using the vaccine against a diarrhoea-causing virus called rotavirus because the vaccine is contaminated with an apparently harmless pig virus. [ID:nN22219667]

In a statement on its website Swissmedic, the Swiss licensing and supervisory authority, said not to use Rotarix until more information is available.

Glaxo (GSK.N) had informed Swissmedic that the DNA from the virus, known as porcine circovirus type 1 or PCV-1, had been found in Rotarix, the authorities said, adding there was little danger for those children who had had the vaccine.

Pfizer and GlaxoSmithKline in deal to supply low-cost vaccines

The Guardian, 25 March 2010, 10:47
http://www.guardian.co.uk/katine/2010/mar/25/news-politicsandhistory

Pfizer and GlaxoSmithKline will supply hundreds of millions of doses of their pneumonia vaccines to the world's poorest countries at heavily discounted prices under a novel agreement, reports the New York Times.

The deal was announced by the Gavi Alliance, a non-profit organisation, which estimated the program could save a total of 900,000 lives by 2015 and up to seven million lives by 2030.

Pneumococcal disease not only kills small children but also maims, leaving survivors with high rates of mental disability, seizures and deafness, says Sarah Boseley in the Guardian. She continues: "There's no doubt about the good that such a vaccine can do. But there will continue to be questions about the way the deal has been done, not least because it is the first of its kind and sets a pattern for the future".

Pfizer and GlaxoSmithKline will provide up to 300 million doses each of their vaccines over a 10-year period under the new agreement. The price for the first 20% of the supply will be $7 a dose. Then the price will drop to $3.50 a dose for the remainder. The vaccines would be paid for by donations raised by Gavi and by the governments of the countries that ordered the vaccines. In Western markets, the pneumococcal vaccines sell for $54 to $108 a dose.

"For the price of a Starbucks latte, developing countries are going to be able to buy a dose of a life-saving vaccine," said Orin Levine, director of the international vaccine access center at the Johns Hopkins Bloomberg School of Public Health, who has worked with GAVI.

The NYT reports that officials involved in the deal say that it historically took many years for a vaccine developed in the West to trickle down to developing countries. But the new program would make the first vaccines available to Africa this year.

"American kids and African kids will get this new vaccine in the same year," Dr. Levine of Johns Hopkins said. "That's just never happened before."

abc NEWS

Pfizer to pay $142M for drug fraud
Sales of drug total $300M annually in Canada

CBC News, 26 March 2010, 3:28 PM ET
https://web.archive.org/web/20100329134056/http://www.cbc.ca/health/story/2010/03/25/gabapentin-ubc.html

Pharmaceutical giant Pfizer has been ordered to pay $142 million US in damages for fraudulently marketing gabapentin, an anti-seizure drug marketed under the name Neurontin.

A federal jury in Boston ruled Thursday that Pfizer fraudulently marketed the drug and promoted it for unapproved uses. The jury sided with California-based Kaiser Foundation Health Plan Inc. and Kaiser Foundation Hospitals, the first to try a gabapentin case against Pfizer.

Data revealed in a string of U.S. lawsuits indicates the drug was promoted by the drug company as a treatment for for pain, migraines and bipolar disorder even though it wasn't effective in treating these conditions and was actually toxic in certain cases, according to the Therapautics Initiative, an independent drug research group at the University of British Columbia.

The trials forced the company to release all of its studies on the drug, including the ones it kept hidden.

A new analysis of those unpublished trials by the Therapeutics Initiative suggests that gabapentin works for one out of every six or eight people who use it, at best. The review also concluded that one in eight people had an adverse reaction to the drug.

"The much larger majority of people will not get any benefit and many of them will have chronic neurotoxicity or poisoning of the brain," said Dr. Tom Perry of the Therapeutics Initiative.

Dr. Harry Pollett, a pain specialist in North Sydney, N.S., calls gabapentin a so-so drug with potentially serious side-effects for patients. These include drowsiness, balance problems, fogginess and edema, or swelling.

"Weight gain is a very common problem and I see that a lot," Pollett said.

The drugs represent a waste of money for Canada's health-care system, said Perry, who questioned why some doctors continue to encourage people to take the drug even though the patients are not benefiting.

"We have been using probably somewhere in the order of around $300 million a year in Canada recently and this drug has been overused since the late 1990s," Perry said. "So, do the math. It's probably well in excess of a billion dollars."

Pfizer defends its actions and its drug. The company has already been hit with $430 million in penalties and fines for fraudulently promoting gabapentin in the U.S.

Discharged soldiers sue for millions over Anthrax experiment

Ynet, 28 March 2010, 20:34
https://www.ynetnews.com/articles/0,7340,L-3869416,00.html

Dozens of soldiers who took part in experiment in early 1990s aimed at determining efficacy of Anthrax vaccine demand $80,000 each in damages. 'Physical harm was passed down to our children,' plaintiff says Vered Luvitch

Sixty-four former IDF soldiers are suing the Defense Ministry for NIS 18 million ($4.8 million) over what they claim is damage caused to them during Anthrax vaccine experiments in the early 1990s.

The experiments, which were meant to determine the efficacy of an Anthrax vaccine, were carried out in light of what was then defined at the time as the "strategic threat of a surprise biological attack facing Israel."

Nicknamed "Omer 2," the experiments included 716 IDF soldiers picked out of a pool of 4,000.

The lawsuit, filed with the Petah Tikva District Court, is based on the principle according to which anyone who decides to take part in an experiment must do so willingly and after considering the risks involved.

As part of the lawsuit the soldiers are demanding that the state reveal the ingredients of the serum that was given to them, in addition to NIS 300,000 (about $80,000) in damages to each plaintiff for mental anguish and emotional distress resulting from the involuntary use of one's body and medical negligence.

In the lawsuit, the plaintiffs cited an Israel Medical Association (IMA) report according to which the experiments were unjustifiable.

The report revealed that even while the experiment was taking place Israel already had a stock of vaccines. "An accelerated effort to produce large quantities of the vaccine was underway a year prior to the experiment, and by the time the experiments were launched, Israel had enough vaccines to cover the civilian concerns," the report said.

"No scientific justification was found for the experiment, scientific background was lacking, the experiment's design and execution did not suit its goals, and no result would have justified those goals. Also, conventional guidelines were not followed, risks and possible side effects were not thoroughly investigated, and a follow-up mechanism to keep track of participating soldiers was not set up," it said.

Dorit Tahan, one of the plaintiffs, said, "In light of the security establishment's lack of respect for human life, we have no choice but to turn to the court in order to teach the IDF a lesson in responsibility."

"We now know that the physical harm caused to the soldiers was also passed down to their children," she said.

NATURAL NEWS
Defending Health, Life and Liberty

Pharma Planning to Dump Experimental and Controversial Vaccines in US Public Schools

Natural News, 29 March 2010
https://www.naturalnews.com/028463_vaccines_public_schools.html

The golden calf of public health was smashed in this recent flu season as many in the United States outright rejected the H1N1 vaccine. Pharmaceutical companies are now holding the bag, as millions of doses of the vaccine are rotting on shelves or being discarded as hazardous waste. Or are they? The manufacturer may find it more cost effective to dump them into the arms of our public school systems.

Parents would revolt if they knew that the pharmaceutical industry, the Department of Health and Human Services, and Centers for Disease Control have allocated millions of dollars in funding to establish vaccine clinics in the public schools. Pumping children with experimental vaccines in public school is about to be pursued as a matter of policy.

Denver Public Schools the Target

Recently, a news article in the Denver Post highlighted two grants issued by the Centers for Disease Control totaling $1.6 million dollars to vaccinate students attending Denver Public Schools
=> https://www.denverpost.com/2010/01/28/pilot-program-provides-shots-to-kids-in-denver-schools/

One grant (http://communications.dpsk12.org/anâ€¦) funds an effort to establish a sustainable school-based vaccination program utilizing the yearly influenza and experimental H1N1 vaccine. The hope is to create a partnership between public health (Denver Health), school personnel (Denver Public Schools), and an entity (Kaiser Permanente) that would bill third party payers.

The second grant provides cash for vaccinating children with the newly approved diphtheria toxoid and acellular pertussis vaccine (Tdap), meningococcal conjugate vaccine (MCV4), and human papillomavirus vaccine (HPV). The new vaccines for adolescents are among the most expensive vaccines
=> https://web.archive.org/web/20080308082532/https://www.cdc.gov/od/pgo/funding/IP08-006.htm
https://web.archive.org/web/20070713204848/https://www.cdc.gov/vaccines/programs/vfc/cdc-vac-price-list.htm

Lead investigator of Denver In-School Immunization Project, Dr. Judith Shlay, of Denver Health, readily admits that if all goes well, plans are in place to implement school-base vaccine clinics nation-wide (a high level overview of this plan was presented to the National Assembly on School-Based Health Care by Dr. Shlay).
=> https://web.archive.org/web/20100202144438/https://www.youtube.com/watch?v=PHjiImtTJKI
https://web.archive.org/web/20100402213603/http://www.nasbhc.org/site/c.jsJPKWPFJrH/b.2564543/apps/s/content.asp?ct=3839567

School Based Health Clinics As the Conduit

The Denver In-School Immunization Project has long been in the works. It was paved in the late 1970s and early 1980s by incrementally creating School-Based Health Clinics (SCHC). In 1978, The Robert Wood Johnson Foundation (RWJF), a non-profit organization funded by the Pharmaceutical Company, Johnson and Johnson contributed $2.3 million dollars to the state of Colorado, making SBHCs a reality.

https://web.archive.org/web/20100212125643/http://denverhealth.org/portal/Services/PublicHealth/ImmunizationClinic/DenversInSchoolImmunizationProject.aspx

https://web.archive.org/web/20130719045152/https://www.sec.gov/Archives/edgar/data/200406/0001016005-98-000009.txt

https://web.archive.org/web/20100211004137/http://www.rwjf.org/reports/grr/032293.htm

Illnesses such as ADD/ADHD, Cervical Cancer, diabetes, asthma, obesity, and learning disabilities were of little consequence in the '70s. However, these disabling syndromes and the medications aimed at treating them have all reached epidemic proportions and astronomically profitable sales.

In the past, parents have discovered challenging a school-based medical model can be extremely dangerous. In September, 2000, Ms. Patti Johnson, a former Colorado State education board member, testified before Federal Congress

https://web.archive.org/web/20100211145613/http://www.politicalwatchdog.com/psych_fraud/johnson.htm

In the 1990s, the much-hyped drug, Ritalin, was maneuvered into public schools to address the growing epidemic of hyperactivity. Mrs. Johnson testimony was prophetic and foreshadowed a future scenario where parents could be charged with medical neglect if they refused to medicate their child per the school's request.

Vaccines for All School Children is the Goal

If School Based Health Clinics are being used as the conduit to vaccinate children, the federally-funded Vaccines For Children (VFC) program and third party insurance coverage provide the finances. According to the grant approved by the CDC, the VFC program would provide "free" vaccines to an estimated forty percent of children in the United States who are not covered by third party insurance plans.

=> https://web.archive.org/web/20100308180826/https://www.cdc.gov/vaccines/programs/vfc/parents/flyer-vfc-parents.htm

"The goal is for this (Denver In-School Immunization Project) to be a sustainable program that can immunize all children in the schools regardless of their insurance. And we need to see at the end of the day, when all the dust settles at the end of this school year, whether the amount that was reimbursed for all these different insurance companies, adds up to the amount of time and effort it took to actually have the clinic." (Emphasis added)

Dr. Matthew Daley
Evaluator of the Denver In-School Immunization Project
Kaiser Permanente
Colorado Public Radio Interview
February 17th, 2010

http://www.kcfr.org/index.php?option=com_content&task=view&id=94&Itemid=234&target_pg=com_day&date=02/17/2010 (*deleted*)

Put into context, the implications of the Denver In-School Immunization Project are enormous. We are speaking of a captured market for vaccine manufacturers (guaranteed purchase of vaccines), insurance companies (guaranteed rise in premiums), and government funding (VFC) all footed by taxpayer dollars. The total price per vaccinated adolescent in the private sector is approximately $500. That's a lot of cash. => *National Vaccine Advisory Committee Recommends Increased Adolescent Immunization*

https://web.archive.org/web/20080717232839/http://www.elsevier.com/wps/find/authored_newsitem.cws_home/companynews05_00963

What Does Pharma Know?

Dr. Matthew Daley is very aware that a paltry 1/3rd of adolescents receive their yearly influenza vaccine, for example. In a semi-recent presentation, Dr. Daley shows obtaining parental consent is a barrier to mass vaccination in a school setting. Furthermore, the presentation suggests improved financial incentives for providing influenza vaccinations. Dr. Daley must be sharing his notes with RAND Corporation because it is almost the exact message RAND pitched to the pharmaceutical giant, Sanofi Pasteur. => *Logistics of Universal Childhood Influenza Vaccination*
https://web.archive.org/web/20100215085624/http://www.preventinfluenza.org/NIVS_2009/7%20-%20Daley.pdf

In 2007, a study performed by RAND Corporation, funded by Sanofi Pasteur, investigated the most efficient way to vaccinate low-income adolescents.
=> https://www.rand.org/pubs/documented_briefings/DB577.html

Nicole Lurie, one authors of the white paper, is now an adviser to Kathleen Sebelius, the Secretary of Human Health Services (HHS). => https://www.opensecrets.org/revolving-door

Mrs. Lurie has a long history of traversing the revolving door between private industry, government duties, and academic appointments (there is no difference from the former head of the CDC, Julie Gerberding, becoming President of Merck Pharmaceuticals Vaccine Division).
=> http://vactruth.com/2010/01/04/julie-gerberding-primed-big-pharmas-pump-with-flu-and-hpv-vaccines/

RAND's report identifies barriers that would obstruct "alternative vaccination campaigns," otherwise known as "in-school vaccination programs." The list of legal issues includes parental consent laws, absence of a reliable medical home (where an adolescent receives medical treatment such as a doctor's office), and access to vaccine registration information.

That's right, mom and dad. Your current ability to refuse vaccines, which is protected by most state laws, is considered a barrier to Pharmaceutical Interests!

*As a side note, many states are taking steps to move parents out of the way and allow public officials the right to vaccinate children, without parental consent. By example, legislation is being considered in New York that would give absolute authority to health professionals to vaccinate children under 18 years old without the parental consent. Another bill in New York seeks to mandate the controversial HPV vaccine (Gardasil) for school entry.
http://vactruth.com/2010/02/12/new-york-adds-hpv-to-the-list-of-vaccinations-required-for-school-entry/

With Public Relations at the foreground, The RAND paper further recommends that Sanofi Pasteur create "Vaccine Champions" or "Registration Champions." Vaccine champions are "ardent supporters of a cause â€¦ They can bring about change by educating those around them and spurring others into action through local events, meetings, or publications." Coincidentally, non-profit organizations such as The Immunization Partnership are following lockstep with the RAND Corporation's group-think. It also has "Immunization Champions."
=> https://web.archive.org/web/20100402220744/http://www.immunizeusa.org/iz-champions/

If vaccines are mandated for public school attendance, and most likely they will be, you can bet that it won't matter whether the vaccine is experimental or not. With rising awareness of the chronic effects of mass vaccination, public skepticism and outcries will likely be countered with fear mongering (http://www.scribd.com/doc/19212191/â€¦) by fanatical vaccine advocates and lobbying groups funded by Big Pharma interests. The only real way to protect the safety of our children is to fiercely safeguard state exemption laws that uphold parents' freedom to choose whether to vaccinate or not. => http://www.scribd.com/doc/19212191/2004flunowak

Yet, by blending society's Federal Educational Framework with a superficial medical model, vaccine proponents have a road map to overcome any damaging future resistance to experimental vaccines. Could it be any clearer that if left unchecked, the pharmaceutical industrial complex soon will be calling the shots instead of parents?

About the author: Jeffry John Aufderheide is the father of a child injured as a result of vaccination. As editor of the website www.vactruth.com he promotes well-educated pediatricians, informed consent, and full disclosure and accountability of adverse reactions to vaccines.

Cancer vaccine programme suspended after 4 girls die

8 April 2010, 0:39 IST
http://www.dnaindia.com/india/report_cancer-vaccine-programme-suspended-after-4-girls-die_1368681

The programme was marred by controversy after four deaths and complications among 120 girls were reported after vaccination.

New Delhi: The Indian Council of Medical Research (ICMR) has told Andhra Pradesh and Gujarat to immediately suspend the cervical cancer control vaccination programme for girls. The programme is part of a two-year study to look into the utility of a vaccine in public health programmes and acceptability of Gardasil, the human papillomavirus (HPV) vaccine made by Merck. Gardasil, available in medical stores across the country, is marketed in India by MSD Pharmaceuticals Pvt Ltd.

The programme was marred by controversy after four deaths and complications among 120 girls were reported after vaccination. The girls complained of stomach disorders, epilepsy, headaches and early menarche. Women activists fear the vaccine may impact the mental health of girls who have shown no signs of distress so far.

Health ministry sources said the vaccination programme is being conducted by Gardasil, jointly with PATH, a Seattle-based NGO, ICMR and the two state governments. About 32,000 girls, aged 10-14, were to be tested in the study.

ICMR chief Dr VM Katoch clarified ICMR was only a technical partner, with an advisory role, in the project. But Katoch said they were checking out who was at fault.

Questioning the study, CPM leader Brinda Karat said: “How has the government embarked on the study of giving three injections to the girls when it is also planning a massive multi-centric dose determination study to see if two doses will suffice?”

For a drug to be administered to children, Karat said, it has to go through stages of clinical trial, including phase 3 adult clinical trials. With Gardasil, only one trial has been carried out with a small sample of 110 girls, which has followed up with them for a month after completion of vaccination and that too only to look at the immune response post-vaccination, Karat said. The vaccine has also been approved for adult women aged 27, Karat said, without any trials on them.

Karat also alleged scientific logic and ethical guidelines have been violated at each step during drug and vaccine trials.

THE WALL STREET JOURNAL.

Robert A. Guth

Gates Rethinks His War on Polio

Wall Street Journal, 23 April 2010, 12:01 am ET
https://www.wsj.com/articles/SB10001424052702303348504575184093239615022

Bill Gates walked into the World Health Organization's headquarters in Geneva – for a meeting in an underground chamber where global pandemics are managed – and was greeted by bad news. Polio was spreading across Africa, even after he gave $700 million to try to wipe out the disease.

That outbreak raged last summer, and this week a new outbreak hit Tajikistan, which hadn't seen polio for 19 years. The spread threatens one of the most ambitious health campaigns in the world, the effort to destroy the crippling disease once and for all. It also marks a setback for the Microsoft Corp. co-founder's new career as full-time philanthropist.

Next week, the organizations behind the polio fight, including WHO, Unicef, Rotary International and U.S. Centers for Disease Control and Prevention, plan to announce a major revamp of their strategy to address shortcomings exposed by the outbreaks.

Nigeria is ground zero for the reemergence of polio. Now the country is making surprising headway against the crippling disease, in part thanks to an unlikely meeting of two leaders: Microsoft mogul Bill Gates, and the Sultan of Sokoto, the spiritual leader of Nigeria's 70 million Muslims. WSJ's Rob Guth reports.

Polio is a centerpiece of Mr. Gates's charitable giving. Last year the billionaire traveled to Africa, one of the main battlegrounds against the disease, to confer with doctors, aid workers and a sultan to propel the polio-eradication effort.

"There's no way to sugarcoat the last 12 months," Bruce Aylward, a WHO official, told Mr. Gates in the meeting in the underground pandemic center last June. He described how the virus was rippling through countries believed to have stopped the disease.

Mr. Gates asked: "So, what do we do next?"

That question goes to the heart of one of the most controversial debates in global health: Is humanity better served by waging wars on individual diseases, like polio? Or is it better to pursue a broader set of health goals simultaneously – improving hygiene, expanding immunizations, providing clean drinking water – that don't eliminate any one disease, but might improve the overall health of people in developing countries?

The new plan integrates both approaches. It's an acknowledgment, bred by last summer's outbreak, that disease-specific wars can succeed only if they also strengthen the overall health system in poor countries.

How a reservoir of poliovirus in Nigeria last year spread to other countries

If successful, the recalibrated campaign could shape global health strategy for decades and boost fights against other diseases. A failure could rank the effort as one of the most expensive miscalculations in mankind's long war with disease. Already, polio has evaded a two-decade-long, $8.2 billion effort to kill it off.

Big donors have long preferred fighting individual diseases, known as a "vertical" strategy. The goal is to repeat 1979′s victory over smallpox, the only disease ever to be eradicated. By contrast, the broader, "horizontal" strategy has less well-defined goals and might not move the needle of global health statistics for years.

The polio fight is a lesson for Mr. Gates's foundation, which is funding other vaccines that could face similar setbacks. In the polio fight, his foundation backed a program that was following an outdated playbook. Polio's resurgence last year forced a major rewrite.

The shift on polio was informed by Mr. Gates's trip last year to Nigeria, a nation with a history of exporting the virus to other countries. Mr. Gates was accompanied by a Wall Street Journal reporter.

Mr. Gates has forged himself as a global-health diplomat following his 2008 retirement from Microsoft. He is using his star power and $34 billion philanthropy to try to push businesses, health groups and governments to improve health in developing countries.

In the Nigerian city of Sokoto, the dusty center of a once vast Islamic empire, Mr. Gates drove to a palace, walked past a row of trumpeters and found himself looking up at a man on a throne wearing a flowing robe and turban – the Sultan of Sokoto, spiritual leader of Nigeria's 70 million Muslims.

Just as Mr. Gates introduced himself to the sultan, the lights flickered out.

"I want to welcome you to the real world – to the real third world," the sultan said to Mr. Gates from his gilded chair in the darkened room.

Men like the sultan are important allies. In 2003, Islamic leaders in northern Nigeria spread rumors that polio vaccines sterilized Muslim girls. Leaders halted vaccinations, allowing the virus to spread. The WHO said the virus eventually infected 20 countries.

By the start of last year, Nigeria was home to half of the world's 1,600 polio cases. The sultan could help get the campaign back on track.

Speaking to Mr. Gates and a room of religious leaders, the sultan declared his support for the polio fight. "We want to show you our commitment," he said. "The time you have taken to come here will not be in vain."

But he, too, questioned the wisdom of targeting one disease. "Other health issues should be looked into," the sultan said, "instead of just facing one direction with polio eradication." He ticked off tuberculosis, HIV and AIDS, malaria, cholera and a parasitic infection known as "snail fever."

After the global victory over smallpox 30 years ago, a rush of energy went into similar "vertical" attacks on single diseases. The polio program followed that approach and made great gains. Led by WHO and donors such as Rotary, the campaigns by the year 2000 slashed the world's polio cases to under 1,000 from 350,000 in 1988. Polio fighters planned to eradicate the disease by 2000.

That date came and went. But polio persisted, eating up billions of dollars.

Critics argued for a shift away from killing polio to free up money for controlling multiple diseases. In some countries, polio campaigns became an example of a functioning vaccination system even as other diseases were missed. Mr. Gates saw that himself in Nigeria.

Arriving at a Sokoto health clinic in a Toyota minivan stocked with Diet Coke, Mr. Gates stepped inside and was soon leaning on a wooden desk, flipping through children's vaccine records. "Do you know if this child had the first dose of DPT?" he asked, pointing to a record of a diphtheria vaccination of a boy who appeared to have missed a treatment. A health worker beside him didn't have an answer.

The clinic also had no hepatitis B and yellow fever vaccines, the workers said, because the government's system for supplying medicine wasn't working.

By contrast, in front of the clinic, a polio campaign was in full swing. Health workers tended coolers filled with vials of vaccine for children gathered there.

At a meeting the next day in the capital, Abuja, Nigeria's head of primary health care, Dr. Muhammad Ali Pate, reopened the vertical-vs.-horizontal debate. Even if Nigeria lowers polio cases, he said, the gains "can't hold" without a broader health-care system, he said.

Mr. Gates listened, seated behind a name tag that read "Our Guest." Dr. Pate showed a slide of a cartoon steam-engine train with cars labeled "Education" and "Disease Control." Polio should be just one car in that train, he said.

Mr. Gates didn't disagree – certainly Nigeria needs a functioning health system, he said in interviews. But it was a matter of priorities, he said. With the world so close to killing polio, countries like Nigeria should make eradication a top priority, he said. Victory would free up millions of dollars to pay for broader health improvements.

"So the benefit of finishing is huge," he said.

On the plane, Mr. Gates strategized about what else would help win the fight, balking at one religious leader's suggestion: forced vaccinations. "Strap 'em, down, I say! Let's make it illegal" to not take the vaccine, Mr. Gates joked. Then he got serious again, citing failed attempts in the U.S. to enforce compulsory vaccinations.

In many respects, Mr. Gates remains a tech geek at heart. Aboard his plane, he expounded on an array of scientific topics: From developments in genotyping, to research showing that Bangladesh's high disease-immunity rates are due to "oral-fecal" transmission (when people build immunity by ingesting contaminated food or water).

In Nigeria, Mr. Gates scored a diplomatic triumph. He won commitments from the sultan, and from Nigeria's governors, to take a more active role in polio vaccinations. "We really stand at the threshold of global health success on polio," he told the assembled governors at the close of the trip.

However, just three days later, a new front opened 2,000 miles away in Uganda. There, a woman walked into a hospital to say her son couldn't move his left leg. It was Uganda's first polio case in 12 years.

Cases also popped up in Mali, Togo and Ghana and Cote d'Ivore, which hadn't reported polio for four years. A girl in Kenya became that country's first polio case since 2006.

Polio, which spreads through water contaminated by human feces, paralyzes just one person for every 200 infected. Discovering just a few cases could mean that thousands have been infected. That demands massive vaccination campaigns.

On Feb. 28, 2009, Mr. Aylward, the WHO official, was grocery shopping in Geneva with his wife and son when he got an urgent email about the Uganda case. For 30 minutes, Mr. Aylward stood next to a spinach display, working his phone and setting in motion a plan that 10 days later vaccinated 48,000 children in Uganda.

Costly emergency responses like this became increasingly common last year. The Gates Foundation had set $47 million aside for emergencies, Mr. Aylward said. By early June, the money was running down.

That month, Mr. Gates flew to Geneva for the meeting in the WHO's underground room.

Mr. Aylward came with good news to offset the bad news about polio's resurgence, he recalled later. After describing the outbreaks, he shifted to Nigeria's progress against polio and described positive results from a trial of a new vaccine.

But those positives didn't offset the risks of polio's revival, say several attendees of a follow-up meeting. "It was becoming evident that the virus almost knew no bounds," said Dr. Steve Cochi, senior adviser at Centers for Disease Control. "It kind of confirmed some of our worst fears."

A month later in Seattle, Gates Foundation officials paused at a PowerPoint presentation showing the foundation's polio grants were approaching $1 billion. It was a staggering amount for a

program that appeared to be stalling. “We can’t go to Tachi and Bill and ask for more money,” without reviewing the program, one person said, referring to Mr. Gates and Tachi Yamada, a top foundation official, according to an attendee.

In August, experts commissioned by the WHO landed in Angola, Pakistan, Afghanistan, India and Nigeria to evaluate the polio program. In Africa, a team found that once polio had been ended in some countries, weak health-care systems let it return. In northern India, bad sanitation, malnutrition and other intestinal issues are believed to hurt the oral polio vaccine’s effectiveness.

These findings echoed the message to Mr. Gates in Nigeria, and marked a turning point among the Gates Foundation and other backers of the polio fight in the debate over whether the strictly “vertical” polio strategy could succeed.

In October, the Gates Foundation summoned backers of the program, including Unicef, CDC and Rotary, to its Seattle headquarters for a major rethink. Two weeks later it called in independent experts for help. The outcome of those meetings will be reflected in the revamped plan coming next week. Polio backers say they are buoyed by reports of just 71 polio cases worldwide this year, vs. 328 in the year-earlier period.

If approved in May by member nations of the WHO, the new strategy will set ambitious goals for getting close to eradicating polio by the end of 2012. The plan bolsters the core “vertical” approach of polio program but also adds a “horizontal” strategy, including training for health workers on topics such as hygiene and sanitation.

Nigeria will be a key testing ground. The country has made strong progress against the disease since Mr. Gates’s visit. But stopping polio there, and in at least one of the three other countries where it’s deeply rooted, will be the main challenge in the next three years, Mr. Aylward says. Failure to achieve that goal will raise questions over whether the program continues, he says.

A big hurdle is money. The polio program is $1.4 billion short of the $2.6 billion it needs over next three years. The Gates Foundation will continue its polio grants, but says it can’t make up the shortfall.

But funding is just one worry for Mr. Gates in his new career. He built his foundation on the promise of life-saving vaccines, reflecting his penchant toward finding technological solutions to problems. As polio shows, technology can be hampered by political, religious and societal obstacles in the countries where he’s spending his money. He’s still learning how to navigate through those forces.

In Nigeria last year, Mr. Gates sat on the lawn behind his hotel reflecting on that. Science can simplify the job, he said, but “the human piece is the ultimate test.”

WEB OF EVIDENCE

Dr. Leonard Horowitz

Profitable Depopulation Plot links JP Morgan-Chase and Goldman Sachs to Vaccination Contaminations, and BigPharma Corruption

WordPress, Web of Evidence, 29/30 April 2010.
https://clareswinney.wordpress.com/2010/04/30/profitable-depopulation-plot-links-jp-morgan-chase-and-goldman-sachs-to-vaccination-contaminations-and-bigpharma-corruption/

A medical investigation into suspicious outbreaks and propaganda used to sell drugs and vaccines has exposed investment bankers at JP Morgan-Chase (JPMC) and Goldman Sachs (GS) for plotting to shock/stress, frighten, poison, and kill billions of people most profitably–pharmaceutically – according to the Editor-in-Chief of Medical Veritas journal.

While researching a powerful Partnership for New York City (PFNYC), uniting Wall Street's wealthiest industrialists, Harvard-trained public health expert, Dr. Leonard Horowitz, and investigative journalist, Sherri Kane, discovered shocking evidence of a conspiracy to commit global genocide by generating diseases and death to advance profitable pharmaceutical depopulation.

Population planners at the highest levels of government and industry conspired to spread diseases, vaccines, drugs, and death most profitably, according to research published in the latest issue of Medical Veritas.

In a related Special Report posted on YouTube, Dr. Horowitz urged humanitarian organizations and activist groups worldwide to issue investigations, alerts, civil complaints, and criminal charges to stop the pharmaceutical depopulation plot because it risks genetic inheritance, new pandemics, and the possible extinction of the human race.

"Corruption in the drug industry is rampant and transparent," Dr. Horowitz explains. "Investment bankers at JPMC and GS, who acquired controlling interests in the largest drug firms during mergers and acquisitions, have placed 'depopulation' near the top of their list of geopolitical priorites. Their depopulation agents are now in top positions of government, finance, and industry.

The depopulation plan is supported by the world's wealthiest people, including Bill Gates, who admittedly funds vaccinations to reduce global populations by 10-15%. Leading population planners and economic developers advance identical plans to cull the world's population to 1 billion.

"Killing 6-out-of-7 people globally, most profitably, requires planning and an unprecedented conspiracy to commit genocide by applying advances in genetic biotechnologies exclusively available and affordable to drug companies controlled by the investment bankers," Dr. Horowitz adds.

The doctor points to the fact that US Treasury Department officials previously operated JPMC and GS on behalf of majority stock holders and their partners in pharmaceutical companies heavily represented in the PFNYC and the trade organizations that negotiate multi-billion dollar government purchases of drugs and vaccines.

Researchers, including vaccination contamination expert Dr. Viera Scheibner, reports in the current issue of Medical Veritas that polio virus vaccines are produced in African green monkey kidney cell cultures routinely contaminated with transmissible cancer viruses.

By reviewing drug company patents, Dr. Horowitz learned that the makers of H1N1 swine flu and rotavirus vaccines use the same cultures risking recombinations, genetic mutations, and unstoppable transmissions of deadly agents threatening new pandemics.

"This best explains why public health officials are preparing for vaccine-transmitted H1N1s cloned in monkey cells to recombine with bird H5N1s currently circulating. This threatening and most deadly recombination of flu viruses, officials herald may happen in the Fall," Dr. Horowitz warned.

Besides the inadequacies of safety testing new vaccines without using placebo controls, it is this issue of reliability of information that concerns more than half of the medical physicians polled since they became aware that the entire medical industry has been hijacked by Wall Street's pharmaceutical profiteers. Now they are learning from famous people, like Gates, that the world's wealthiest people are administering vaccinations for depopulation.

"I love vaccines," Gates stated at a TED conference in February, 2010, while lecturing on ways to reduce global populations to stem environmental pollution.

The links between the directors of major drug companies, mainstream media moguls, and investment bankers at JPMC and GS are so obvious and incriminating, and the dispersion of unsafe vaccines so common and disturbing, only profitable depopulation as a planned outcome of pharmaceutical investments can explain the current situation.

"Complete censorship was the only option officials have had to prevent a meltdown in public opinion about medicine and the pharmaceutical industry," said Ingri Cassel, a leading vaccine risk awareness activist. "This explains why news of this vaccination depopulation plan has been neglected by the special-interest-influenced media."

Investigating conflicting pharmaceutical interests influencing news coverage, Sherri Kane, previously a writer for FOX News in Los Angeles, learned that the majority shareholders in FOX, TimeWarner, News Corp., and the Wall Street Journal, are heavily invested in GlaxoSmithKlein and Merck's CSL Laboratories, both makers of risky drugs and vaccines.

Lloyd Blankfein, the CEO of Goldman Sachs, became a major shareholder in AstraZeneca following his direction of the company's acquisition of the H1N1 FluMist maker, MedImmune. Blankfein has also leveraged ABC-Disney following their merger with money he raised through GS investors. This resulted in Dr. Oz's heavy promotion of H1N1 vaccines on ABC last year, when officials learned that the vast majority of Americans were unwilling to risk the exposure.

Rupert Murdoch and Lloyd Blankfein co-chair the PFNYC, founded by CHASE principal, World Bank ambassador, and America's leading energy industrialist and medical monopolist, David Rockefeller. The PFNYC was chartered by the Royal Family of England–a majority share holder in General Electric–the world's largest company–that controls NBC/Universal/Comcast, and MSNBC with Bill Gates.

The PFNYC was pledged to play a central role in reconstructing Ground Zero following the 9/11 attacks, according to Kathryn Wylde, President & CEO of the Partnership and current Director of The Federal Reserve Bank of New York. The organization compiled the economic report on the damage done, advanced financial plans for reconstructing the World Trade Center, and advised leading financiers regarding reconstruction investments.

According to 911-Truth movement directors, Wylde and other members of the PFNYC are implicated in the treasonous attacks that scientific evidence says involved thermitic explosives used in controlled demolitions.

These allegations and PFNYC connections to 9/11 events implicating investment bankers at Goldman Sachs are additionally scrutinized in a new feature-length film produced by Dr. Horowitz.

PHARMAWHORES: The SHOWTIME Sting of Penn & Teller premieres in theaters across North America this summer. (Quicktime and MP-4 downloadable versions are available through Pharma Whores.com.)

The PFNYC is co-directed by Jeffrey B. Kindler, the Chairman and CEO of Pfizer–the world's largest drug company. Kindler stewards Pfizer through multi-billion dollar acquisitions also involving JPMC and GS financing.

The Pharmaceutical Research and Manufacturers of America (PhRMA), the drug industry's main trade organization, is also directed by Kindler. PhRMA officials engage White House and Pentagon officials in private negotiations determining pricing for stockpiles of drugs and vaccines.

Dr. Horowitz views this covert administration of multi-billion dollar pharmaceutical contracts as symptomatic of the industry's corruption. The "corporate shell game" is played using mergers and acquisitions directed by the same people. Their creation of the PhRMA trade organization provides the illusion of their legitimacy and fair competition. Price fixing occurs behind closed doors, explaining why prices vary so widely internationally.

Another gross example of corrupt government pharmawhores sucking Wall Street's slime, is Congressman Henry Waxman's (D-CA) treason against the American people for sneaking dietary supplement regulation language into 'The Wall Street Reform and Consumer Protection Act of 2009,' (H.R. 4173).

For years, Waxman has attempted to pass legislation restricting consumer access to nutritional supplements on behalf of BigPharma. The FDA, largely controlled by BigPharma, contends regulating vitamins, minerals, herbs, homeopathics, oils, colloidal silvers, and more natural products protects consumers.

During health care reform negotiations with PhRMA, Waxman feigned concern that drug companies were driving too hard a "bargain" on pharmaceutical prices, but still voted in favor of the cartel's freedom to set their own limits.

Most telling and ironic, PhRMA's official negotiator to whom Waxman complained, "PhRMA should contribute more than PhRMA wants to contribute," was Billy Tauzin, the former congressman who held Waxman's job as chair of the Energy and Commerce committee

REUTERS

Pig virus DNA found in Merck rotavirus vaccine

Reuters, 7 May 2010, 2:26 AM GMT+8
https://www.reuters.com/article/business/healthcare-pharmaceuticals/pig-virus-dna-found-in-merck-rotavirus-vaccine-idUSTRE6454N8/

WASHINGTON (Reuters) - Pieces of DNA from two pig viruses were found in Merck & Co Inc's rotavirus vaccine, but there was no evidence of a safety risk, U.S. health officials said on Thursday.

The finding follows a March announcement of an apparently harmless pig virus found in a rival rotavirus vaccine from GlaxoSmithKline Plc.

Merck said in a statement the company's testing found "very low levels" of DNA from porcine circovirus, or PCV, in its Rotateq vaccine.

THE WALL STREET JOURNAL.

Jennifer Corbett-Dooren

FDA Panel Members back use of Merck, Glaxo Rotavirus Vaccines

Wall Street Journal, 7 May 2010, 04:31 PM

https://web.archive.org/web/20100517054410/http://online.wsj.com/article/BT-CO-20100507-716126.html?mod=WSJ_latestheadlinesWASHINGTON
https://web.archive.org/web/20100510171742/http://www.ageofautism.com/2010/05/fda-recommends-us-allow-use-of-rotavirus-vaccines-while-safety-being-studied.html

(Dow Jones) – A Food and Drug Administration panel said Friday fragments of pig viruses found in vaccines used to protect infants against rotavirus didn't appear to cause health risks.

While the panel didn't take a vote on the products, several members of the agency's vaccine panel said the vaccines – Merck & Co.'s (MRK) Rotateq and GlaxoSmithKline PLC's (GSK, GSK.LN) Rotarix – should remain on the U.S. market while additional studies are conducted about the impact of pig viruses.

In the meantime, the panel said parents who are considering whether to vaccinate their infants need to be informed about the findings.

FDA panels are made up of non-FDA medical experts and are called upon to make nonbinding recommendations to the agency.

Karen Midthun, acting director of FDA's Center for Biologics and Research, said the agency would be "very expeditious" in making recommendations about whether either vaccine should be used. n March, the FDA recommended that doctors stop using Glaxo's vaccine after a team of researchers from the University of California in San Francisco found DNA of a porcine circovirus known as PCV1 in the vaccine. Those tests didn't find the same pig virus in Merck's Rotateq.

However, on Thursday the FDA said more sensitive tests subsequently conducted on Rotateq found a "low level" of the same PCV1 virus, as well as a related porcine circovirus known as PCV2. Both viruses are common in pigs -- and neither is known to cause illness in humans -- but PCV2 may cause illness in pigs.

The FDA said it wouldn't decide whether it would recommend that use of Merck's Rotateq be suspended or whether it would lift its suspension recommendation involving Glaxo's Rotarix in advance of the meeting. The panel meeting had originally scheduled to discuss Rotarix but also included Rotateq in light of similar findings about pig virus fragments discovered in the product.

"PCV is not infectious in humans," said Harry Greenberg, a panel member and medical professor at Stanford University. "The benefits far outweigh the risks."

Both the Glaxo and Merck vaccines are designed to protect infants from a gastrointestinal illness caused by rotavirus and have been given to millions of babies. While rotavirus is rarely fatal in the U.S., it contributed to about 70,000 infant hospitalizations annually before Merck's vaccine was approved in 2006 and Glaxo's in 2008.

Umesh Parashar, an epidemiologist at the Centers for Disease Control and Prevention, said the most recent agency data looking at the impact of the vaccines in the U.S. show "almost...a complete wipeout of rotavirus activity." Parashar deemed rotavirus "a major killer" of children in parts of the world that can't adequately treat dehydration from severe diarrhea.

One theory about how pig virus fragments got into the vaccine offered by both the FDA and the companies is that PCV fragments might be in trypsin, an enzyme derived from pigs that is used in the manufacturing process of the vaccine. The enzyme is used to grow viruses used in the vaccines.

Barbara Howe, a GlaxoSmithKline vice president in the company's vaccine division said, "all available data support PCV1 in Rotarix is a manufacturing quality issue, not a safety issue." She said the company is working on ways to remove PCV from the vaccine but that developing a new manufacturing process "is complex and will take time."

World Health Organization moving ahead on Billions in Internet and other Taxes

FOX News, 11 May 2010, 1:00 pm EDT
https://www.foxnews.com/world/world-health-organization-moving-ahead-on-billions-in-internet-and-other-taxes

The World Health Organization (WHO), the United Nations' public health arm, is moving full speed ahead with a controversial plan to impose global consumer taxes on such things as Internet activity and everyday financial transactions like paying bills online – while its spending soars and its own financial house is in disarray.

The aim of its taxing plans is to raise "tens of billions" of dollars for WHO that would be used to radically reorganize the research, development, production and distribution of medicines around the world, with greater emphasis on drugs for communicable diseases in poor countries.

The irony is that the WHO push to take a huge bite out of global consumers comes as the organization is having a management crisis of its own, juggling finances, failing to use its current resources efficiently, or keep its costs under control – and it doesn't expect to show positive results in managing those challenges until a year from now, at the earliest.

Comments

Emanuel van den Bemd 2010-05-13 04:59:41

Medical Laboaratory Scientist

The UN has no right to tax us even more, especially since they have lost all credibility by making a complete mess of everything they do. Signature nations should pull out of that organisation if they want to avoid the wealthy elitist's strategy to enslave and cull the masses. A tax grab is further evidence that the UN, through the WHO, is abusing the power that the signature nations have entrusted it with. It's main aim is to destroy us and our Governments by:

1. Imposing crippling taxes.
2. Denaturing the food chain.
3. Prescribing toxic medical drugs of every discription and at every opportunity.
4. Disseminate weaponised viruses.
5. Vaccinate targeted populations with vaccines containing nanochips, destructive adjuvants and additives that destoy immunity and fertility.
6. Creating false flag pandemics.
7. Eventually culling 90% of the global population.

One can only hope that there is a guardian angel in the wings that will act strongly on our behalf and put a stop to this diabolical prospect of an armageddon on our doorstep. I can see nothing but peril looming in the dark underbelly of the UN eugenics strategy which is userping, festering and engulfing every nation on earth.

It is incredible that a strategy of mass enslavement and annihilation has evolved over the heads of the majority of us. If the reader is not concerned, is sceptical and believes this is fiction ...investigate it. Think of your children and grandchildren. Protect them from the totalitarian juggernaught. ... etc.

Chemtrails: The Consequences of Toxic Metals and Chemical Aerosols on Human Health

Global Research, Part I, 12 May 2010
https://web.archive.org/web/20100513223941/http://www.globalresearch.ca/index.php?context=va&aid=19047

For decades, we have known that heavy metals and chemicals can cause grave physical harm. Going back to Rachel Carson's "Silent Spring," we have known and been amply warned of the serious consequences of using or being exposed to these poisons in our daily activities. Thousands of these are well-documented carcinogens.

Building on Carson's ground-breaking research, we also know that certain kinds of chemicals can and do disrupt human [and other animals'] entire immune system. Going back 30 years, researchers were investigating what became known as endocrine [hormone] disrupting chemicals and how they were affecting frogs [who sometimes had five legs or hermaphroditic characteristics], other aquatic animals, and mammals. These animals were the proverbial canaries in the coal mine. In another pioneering book, "Our Stolen Future," authors Dr. Theo Colburn, Dianne Dumanoski, and John Peterson Myers clearly demonstrate that 1 + 1 hormone-disrupting chemicals did not equal 2. Rather, in a nightmare of mathematical proportions, these poisons acted synergistically; and 1+1 could equal up to 1,600 times the original dose. We are also exposed to more than 100,000 chemicals regularly. Most of them have never been tested for human safety. So, almost nothing has been done to reduce human exposure to a myriad of hazardous chemicals. In fact, over the past decade, the Bush administration dismantled many environmental laws in existence for 30 years, to let corporations off the proverbial hook. [Just look at what's unfolding in the Gulf with the BP oil spill.]

Although this information, on the dangers of hormone disruption, is now more widely available on Internet sites, it still is not well known by the average person who gets news mostly from mainstream media.(1) Most of these highly toxic chemicals are invisible; and, therefore, are easily off our collective radar. With the high stress level created by the deliberately orchestrated financial crisis --where millions have lost their jobs and homes– a degraded/collapsing environment or serious health problems are not priorities –especially, if very little is reported in mainstream news. This disaster scenario is part of the larger picture of what Naomi Klein writes about in her book "The Shock Doctrine." We have so many major crises, one after another, that it is hard just to keep up with one's daily routine –let alone have time to read and consider the toxicological health ramifications of massive amounts of thousands of heavy metals and chemicals that have poisoned our entire food chain and, thus, our own supposed "health." We are at the very top of this wrecked food chain.

Now, however, there is another far more insidious layer of toxicity that is not being addressed at all in any mainstream, corporate-controlled news, and it is affecting our very survival. It is, however, being addressed more and more by independent researchers who have supporting evidence to back up their Internet reports.

For more than a decade, first the United States and then Canada's citizens have been subjected to a 24/7/365 day aerosol assault over our heads made of a toxic brew of poisonous heavy metals, chemicals, and other dangerous ingredients. None of this was reported by any mainstream media. The US Department of Defense [DOD] and military have been systematically blanketing all our skies with what are known as Chemtrails (also known as Stratospheric Aerosol Geoengineering). ...

THE FLU CASE

(Linda Auxer) The Victim**,** (Ashley Belli) Thew Editor

Nanotechnology and Retinoid Therapy must be Stopped

The Flu Case, 16 May 2010, 13:41
https://web.archive.org/web/20100523172112/http://www.theflucase.com/index.php?option=com_content&view=article&id=3497%3Ananotechnology-and-retinoid-therapy-must-be-stopped-&catid=1%3Alatest-news&Itemid=64&lang=en

A severe crime is being committed against women and teenagers and people suffering devastating diseases, including cancer. Pharmaceutical corporations and physicians are luring women to use anti wrinkle creams to prevent wrinkles and having glowing radiant skin.

These agents, known as retinoids (tretinoin, accutane 13 cis isotretinoin, etretinate (banned 1998), acitretin (turns to etretinate in the body), atRA) are poisons and are known as chemo drugs. They are, also, known as Renova 0.05%, Renova 0.02%, Retin-A, Sotaret, Vesanoid, Abenela, Aierol, Aitralin, Avita, Stieva-A, Acitretin, Soriatane, Accutane isotretinoin.

They are the biological derivative of Vitamin A (biological is a living microorganism). They are taken from plants, fungus (ex. xanthomonas, fusarium), bacteria (e.coli bacteriorhodopsin), intestines and liver of animals and humans (Am580 is the membrane of a mus mouse's liver).

They are retinol and retinal and palmitate and caprylic acids that make long chain reactions from the fatty alcohols and acids. They are stereoisomers and used in molecular protein motors, as they have propellars and flagellars. See Stereo isomers Chapter Six (pdf), it will inform you how stereoisomers push and pull and make a steering configuration as they steer in the gas vesicles and miscelles that are used.

These agents are not sterile and any disease or virus the species they came from had will be in these protein membranes and transfected into the human body. TTNPB is a retinoid analogue and is an engineered hepatitis B virus taken from a carcingenic hepatic human flank.

One retinoid is toxic alone and can cause cytotoxicity, opacity of the cornea, Keratitis (stated in Seeger and Weiss Accutane Civil Suits in Atlantic City Superior Courts), coagulase neg. strep., biofilms on the eyes, fusarium, edema of the eyes and brain and lungs, myocardial infarctions, high cholesterol, diabetes, migraines, abdominal pain, irritable bowel syndrome, bone density and fractures, swelling of hands and feet, cancer and secondary tumors when discontinued, perivascular mononuclear infiltrates (leukocytoclastic vascullitis), ground glass opacity of the lungs and infiltrates, respiratory problems, restrictive ventilator defect (PFT will inform of airways being blocked), rashes, skin bites, polymerization of plastic and rubber compounds will cause scleroderma from silicone used, and silicosis, chemical dermatitis, leukemia (from the benzene compounds), the phosphorous compounds in these agents will deteriorate the jaw bone (known as "phossy jaw"), gingervitis, central nervous system problems.

Natural retinoids regulate tissue, bone, vision, feathers etc. in embryo development. Retinoids splice and slice DNA. Using retinoids from other living organism and putting them into the human body to splice and slice human DNA will alter genetics.

The pharmaceutical name for altering genetics is "gene expression", which to the general population would not be known. Photosensitive means carcingenic as stated in the FDA "Photo Safety Toxicity Report", dated 2003 and out on FDA websites. Retinoids are photosensitive agents and can cause cancer.

Synthetic retinoids, like 13-cis isotretinoin are man made using the toxic secretions of these proteins and using zinc salts to create the skeleton structure of their original state. Zinc salts make translucent nano wires that self assemble. Nano technology is a technique that biologists and chemists have known and been experimenting with since 1959. It is a controlling technique.

AMERICA NEWS NOW

Flu Vaccine Use to Modify Human Behavior

"*Leaked Pentagon Video*"

New America Now, 15 June 2010

https://web.archive.org/web/20131219015629/http://www.youtube.com/watch?v=2MuXgpl2Sxg

What you are about to hear is not science fiction or conspiracy theory but a glimpse of what is going on behind the closed doors of the United States Pentagon. In a small auditorium labeled BC232 a man is presenting a discussion on how the military industrial complex can spread a virus and use a vaccine to extinguish what the pentagon calls undesirable human behavior. Specifically in this case religious behavior. This is dark science my friends. With all the mandatory vaccine programs in the United States do not be deceived for a moment that something like this will not or possibly hasn't already been used on the American public

Fact, vaccines have never eradicated anything, ever

Vactruth, 23 July 2010
https://vactruth.com/2010/07/23/fact-vaccines-have-never-eradicated-anything-ever/

Le tribunal de Tournai devait rendre ce mercredi un jugement qui devrait interpeller tous les jeunes parents. Il concerne le vaccin contre la poliomyélite. Le seul vaccin obligatoire en Belgique.

For years now the myth that vaccines can eradicate illnesses has existed. This myth was perpetrated by the pharmaceutical industries and backed up by our governments and has existed purely to trick the general public into having countless vaccines in the ruse that they will live long and healthy lives. I want to examine the facts and attempt to dispel the myth and prove that vaccines cannot and will not eradicate illnesses because many are caused by viruses which can mutate as we have seen with the flu virus, thus rendering the vaccines against it, useless.

I will begin by asking the question: – If vaccines eradicate illnesses, then why do they still exist today? The word eradicate according to many dictionaries, means to eliminate, to wipe out, obliterate. So taking these definitions into account have any of the illnesses we vaccinate against today been truly eradicated from our world? The plain and simple answer to this question is no they have not.

To examine this properly, we have to see if anything has ever been truly eradicated with vaccines, if so, then no child would ever get these illnesses because they would no longer exist.

On Vaccinate Your Baby : History of Disease Eradication the first paragraph states:
"Immunization is one of the most successful public health achievements of the 20th century. Due to systematic vaccination programs, smallpox has been eliminated worldwide, and cases of polio, measles, diphtheria and Hib are at all-time lows. The burden of other diseases has been significantly reduced ."
=> https://web.archive.org/web/20080811083145/http://www.vaccinateyourbaby.org/why/history/index.cfm

Is what they are saying true? The WHO say it is, on their website WHO | Immunization against diseases of public health importance they say:
"Immunization is a proven tool for controlling and even eradicating disease. An immunization campaign carried out by the World Health Organization (WHO) from 1967 to 1977 eradicated the natural occurrence of smallpox. When the programme began, the disease still threatened 60% of the world's population and killed every fourth victim. Eradication of poliomyelitis is within reach. Since the launch by WHO and its partners of the Global Polio Eradication Initiative in 1988, infections have fallen by 99%, and some five million people have escaped paralysis. Between 1999 and 2003, measles deaths dropped worldwide by almost 40%, and some regions have set a target of eliminating the disease. Maternal and neonatal tetanus will soon be eliminated in 14 of 57 high-risk countries."
=> https://web.archive.org/web/20100324210043/http://www.who.int/mediacentre/factsheets/fs288/en/index.html
Significantly reduced perhaps but has any disease or illness been eradicated?

Let us take a look.

According to some doctors Smallpox has been seen to still exist even though the world has been told that vaccines have eradicated it. According to Dr Kris Gaublomme, it has simply been renamed and is now called Monkeypox. In his article Has smallpox really disappeared from the earth? – Dr. Kris Gaublomme he explains: [=> http://www.whale.to/v/gaublomme4.html]

"A new and embarrassing development was the resurgence of pox-family viruses in Africa, known as the 'monkeypox'. This fact has been known for many years but the public was reassured that this had nothing to do with smallpox and that the human species was safe.

Not as safe as we were told,though, since in the Congo in 1970, pox viruses were isolated from humans[2] corresponding to the pox viruses found in captive monkeys in 1958 and identified the next year (3). It was baptised 'monkeypox~. The same virus was isolated from 6 humans in 1959 by Foster. In 1976, Gipsen reported on more cases in Nigeria (4).

The terminology of the disease became ever more confusing, since what were at first simply 'monkeypox' are now introduced into literature as'human monkeypox'. What, now, is the difference between smallpox and 'human monkeypox'? It is interesting to read in a recent article in the Lancet that "Human monkeypox is a systemic exanthem, resembling smallpox, that occurs as a sporadic zoonosis in rural rainforest villages of western and central Africa. The disease is caused by an orthopoxvirus, which is transmitted to human beings by handling infected animals; serosurveys have implicated squirrels ... as the probable reservoir. Secondary human-to-human spread by aerosol or direct contact accounts for about 28% of cases…" (my emphasis)

So, let us make a simple addition. This virus is an 'orthopox'Â virus, which means, literally translated, a 'real pox' virus. This virus spreads among humans causing an exanthem 'resembling' smallpox, and causing disease and death among the infected (between February and August 1996, 71 cases were notified in the Katako-Kombe area in Zaire, 6 of which 4 died from the disease (5)".

From his report in Atlanta Reuters (WS) via Individual Inc December 15, 1997 Monkeypox outbreak in Africa biggest ever – U.S. we see that humans can catch monkeypox and die from it.

"*The largest outbreak of human monkeypox ever reported has caused more than 500 people to become ill in the Democratic Republic of Congo, health officials said Thursday.*

The Centers for Disease Control and Prevention (CDC) said children 16 and under accounted for 85 percent of the 511 human monkeypox cases that have occurred in the former Zaire since February 1996.

The CDC said it was the largest human monkeypox outbreak ever recorded. Five deaths were recorded, all of them of children aged between 4 and 8.

Monkeypox is a sister virus of smallpox and is generally spread by squirrels and monkeys in the rain forests of western and central Africa. Before the outbreak in the Democratic Republic of Congo, cases of monkeypox in humans were rare." => http://www.whale.to/vaccines/monkeypox.htm

So is smallpox really history or is Monkeypox really Smallpox?

Well the article in the Lancet mentioned above, by Dr Gaubloome, according to the Vaccination Information site http://www.whale.to/vaccine/smallpox1.html says:

"A pilgrim returned home to Yugoslavia from Mecca in February, 1972, with a fever… In the 4 weeks since the pilgrim first had his fever, 150 people were infected across the country. It took 4 weeks before doctors, nurses, and health authorities knew they were dealing with smallpox… 175 people contracted smallpox [thereafter] and 35 died… these events occurred in a well-vaccinated population."

Dr. Vivian Virginia Vetrano says in her article Smallpox:

"*The authorities claim that we will be safe from terrorists attacks using the pox virus because there are adequate stockpiles of cultivated smallpox viruses in Russia and in the USA to make most all the vaccines "needed."* => https://rense.com/general31/pox.htm

It is claimed by medical historians that the vaccination process wiped out smallpox throughout the world. However, the truth is that compulsory vaccination was abandoned because more deaths were caused by the vaccinations than there were cases of smallpox. A slight of the hand trick was used to foster the claim that smallpox was eradicated by the vaccination practice. Everyone who had been vaccinated and who developed smallpox was diagnosed as having chicken pox!

The doctors who were interviewed on recent television shows admit that the vaccine may cause many serious side-effects and that a certain number of persons will develop painful and sometimes lethal sequelae. Yet, they advise that it is better to take the chance and be vaccinated in spite of these dangers."

So have we all been party to an elaborate hoax, has Smallpox existed all along and we have had the wool pulled over our eyes by our governments and the drug companies to push vaccines? Well it is certainly a possibility. Bearing this in mind, let us now examine other illnesses, how well are vaccines doing in eradicating these? Not too well it seems.

The whooping cough or the pertussis infection which is a an infection involving the – respiratory tract and is caused by the bacterium – *Bordetella pertussis*. This is a highly contagious illness known to last for a duration of approximately 6 weeks before subsiding. The disease derives its name from the "whoop" sound made from the inspiration of air after a cough. Although many medical sources describe the whoop as "high-pitched", this is generally the case with infected babies and children only, not adults. On occasions a child may vomit after a bout of severe coughing.

The first vaccine to combat this infection was brought out in 1930's and was given as part of the triple vaccine the DTP.

In 1991, DTaP vaccine was licensed in the United States. The pertussis component of this vaccine is a more purified "acellular" version, which produces fewer side effects as the original vaccine was identified as having a high rate of side effects which included brain injury and even death.

Harold Stearley said this about the DTP vaccine in an article – (4/18/97) The Tainted History of the DPT Vaccine => http://www.albionmonitor.com/free2/dpt.html

"There's no question that DPT vaccinations save lives; they have lowered the annual pertussis deaths from about 1000 annually to less than ten. Unfortunately, as reported by the National Vaccine Information Center (NVIC), the form of the vaccine used and sanctioned by the Centers for Disease Control also kills as many as 900 children per year, and leaves one of every 62,000 children immunized with permanent brain damage."

This makes me wonder if we are swapping one problem for another and if vaccination has been proven not to completely eradicate Smallpox, then do the risks of the vaccines outweigh it's benefits?

Professor Gordon Stewart an M.D and a Emeritus professor of Public Health wrote much on this in his extensive range of papers on the subject. He certainly felt that there were extremely worrying side effects linked to this vaccine and this included death.

In the article **The lies the Government tell when it comes to vaccines** written by myself, I have detailed his work along with an expose of a few of his extremely worrying letters written to the UK Government, proving concern about this vaccine, existed, as early as the 70's and 80's.

=> https://vactruth.com/2010/06/01/government-lies-about-vaccines/

What Professor Stewart was saying and the vast majority of media reports that appeared at the time on the side effects of this vaccine, was worrying many parents and so in 2005, two new tetanus toxoid-diphtheria-acellular pertussis (Tdap) vaccines were licensed. These vaccines are the first acellular pertussis-containing vaccines and made it possible to vaccinate adolescents and adults against pertussis.

So if these vaccines have been so effective, then why are so many children still being infected today, whether they are vaccinated or unvaccinated?

Dr Mercola says in his article on the 15th July 2010 Whooping Cough Kills 5 in California the following:

"After the deaths of five infants, California health authorities have declared an epidemic of whooping cough, also known as pertussis.

The announcement came after authorities noticed a sharp spike in reports of pertussis, which often is mistaken for a cold or the flu and is highly contagious.

A CDC study suggests that the resurgence of whooping cough is due to the vaccine causing an increased and more virulent toxin" => https://www.nytimes.com/2010/06/24/us/24cough.html

Of course many scientists and the pharmaceutical industry would argue that this was because not every person has been vaccinated and that if they had, then this disease would no longer exist. However, this simply is untrue because *vaccinated* people *are still getting the infection*?

In July 2006 a whole year after the latest vaccine promising to keep children safe from this infection and three decades after the original whooping cough vaccine was introduced, the Sunday Times journalist Nigel Hawkes the Health Editor wrote an extremely alarming article called: **Whooping cough still infecting millions of vaccinated children** … which began:

"Millions of British children have probably been infected with whooping cough even though they have been immunised against it.

A study has found that nearly two in five children who went to their GP with a persistent cough had suffered from whooping cough, though very few doctors diagnose it. The results suggest that the whooping cough vaccine is ineffective at preventing infection, but makes symptoms less severe â€" thereby concealing just how common it remains".

=> https://web.archive.org/web/20070618194900/http://www.timesonline.co.uk/tol/news/uk/article684270.ece

Nigel quoted a BMJ study saying:

"In BMJ online, a team from the University of Oxford, the University of Auckland in New Zealand and the Health Protection Agency report that in 85.9per cent of the cases they saw, the children had been vaccinated. But blood samples tested positive for antibodies to Bordetella pertussis, the cause of whooping cough, indicating recent infection.

The team studied 172 children aged 5-16 who visited their family doctor with a cough lasting 14 days or more. Immunisation records were checked, notes made on the symptoms and duration of cough, and blood samples taken for testing. They found that 37.2 per cent of the children had evidence of a recent pertussis infection. The results suggest that the condition is "endemic among younger school-age children", they say, and that doctors should consider a diagnosis of whooping cough even if the child has been immunised."

=> https://www.thetimes.com/article/whooping-cough-still-infecting-millions-of-vaccinated-children-np6p6srntmx

So if this study is correct and one presumes that it is, especially as it was allowed to be reported in the BMJ, a massive proportion of the children who had been vaccinated still went on to contract the illness, thus proving that whooping cough has not been eradicated even for those children who have had the vaccine. This renders this vaccine as somewhat useless in my eyes.

In an article by Barbara Loe Fisher National -Vaccine Information Center she gives a possible explanation: **NVIC Vaccine News** – Whooping Cough Outbreaks & Vaccine Failures

"Pertussis vaccination rates are very high in the U.S. According to the CDC, 84 percent of children under age three have received four DTaP shots.17 By the time American children enter kindergarten nearly every child has gotten all the CDC recommended pertussis shots.18 In 2009, the CDC said that the proportion of totally unvaccinated children in America is only six hundredths of one percent (0.06).19

Even with super high pertussis vaccine coverage in America and other countries like the Netherlands, Australia, Finland and Canada, whooping cough disease cannot be prevented.20 There are two main reasons for this fact.

First, pertussis vaccines widely used since the 1950's have not prevented whooping cough disease from circulating in vaccinated populations. Unknown numbers of children and adults, who have gotten all government recommended pertussis shots, can and do develop whooping cough or are carriers without symptoms.21,22

Because pertussis vaccine immunity is only temporary and does not last, health officials are now telling teenagers and adults to get more booster shots.23 But that is not going to matter if scientific evidence that B. pertussis organisms have mutated and become vaccine-resistant turns out to be correct.24

A second important reason is that another Bordetella organism - parapertussis - also can cause whooping cough.25 B. parapertussis symptoms, while often milder, can look exactly like B. pertussis. But doctors rarely recognize or test for parapertussis.26 And there is NO vaccine for parapertussis."

I am now going to look at how effective the Measles vaccine has been in eradicating the Measles virus. The Measles vaccine first became available in 1963. An improved measles vaccine became available in 1968 and then later in 1971 a combination measles-mumps-rubella (MMR) vaccine became available.

Unlike the Whooping Cough the Measles is a virus and is caused by paramyxovirus and is the most unpleasant and the most dangerous of the children's diseases.

Measles has some very serious side effects and it is these side effects that worry doctors the most and include these taken from NHS website-

- meningitis,
- pneumonia (lung infection)**,** signs of which are fast, difficult breathing, chest pain and deteriorating condition,
- hepatitis (liver infection),
- encephalitis (inflammation of the brain), which can be fatal, so watch for drowsiness, headache and vomiting,
- low platelet (white blood cell) count, known medically as thrombocytopenia, which affects the blood's ability to clot,
- bronchitis and croup (infection of the airways), characterised by a hacking or barking cough, and
- squint, if the virus affects the nerves and muscles of the eye.
- serious eye disorders, such as an infection of the optic nerve (the nerve that transmits information from the eye to the brain), known as optic neuritis, which can lead to blindness,
- heart and nervous system problems,
- serious brain complication known as subacute sclerosing panencephalitis (SSPE), which can sometimes occur several years after measles. Although the condition is fatal, it is very rare, occurring in only 1 in every 100,000 cases of measles.

So how is the measles vaccination doing in eradicating the measles virus? Again let us examine the vaccinated children. Well, according to recent reports this vaccine also can not guarantee that if a child is vaccinated they will not get the measles infection.

In a report MEASLES *: The Real Facts – by* Hilary Bulter the spokesperson for Immunisation Awareness Society she wrote: [=> http://www.whale.to/a/butler9.html]

"FACT. *Vaccinated children still get measles. Deaths and hospitalisations have been recorded for 120 years. The measles death decline graph provided shows that the measles vaccine had nothing to do with the decline in deaths, and has not affected the number of children hospitalised during epidemic years since its introduction. (Appendices to Parliamentary Journals, Official Year Book, Health Department publications such has "Health Trends" and Immunisation Handbook. Also, graphs provided to Herald and Metro in the past) Parents Have a Right to Know That,"*

She goes on to then state some very worrying and proven facts

*"*** A similar campaign vaccinating 7.1 million schoolchildren in England has resulted in a legal firm called Dawbarns (dawbarns @paston.co.uk) (0044 1553 764373) taking legal action against the British Health Department on behalf of the following cases:*

Autism (202), Crohn's disease and other serious chronic stomach problems (110) Epilepsy (97) Hearing and vision problems (40) Arthritis (42) chronic fatigue syndrome (24) Diabetes (9) Guillain-Barre syndrome (9) chronic Thrombocytopenia (5) subacute sclerosing panencephalitis SSPE {3) Wegener's Granulomatosis (2) Multiple Sclerosis (1) Death (14) (Dawbarns fact sheet)

*** The childrens' doctors and specialists have come out in the media in support of the children*

*** The New Zealand, and British Health Departments deny the existence of these cases. (NZ H Dept media release, and BMJ article) and maintain that OPERATION SAFEGUARD eliminated measles from UK. In October 1996, UK started another MMR booster campaign.*

**** Deaths from Measles were virtually wiped out in every <developed country before the vaccine was even used.(See disease decline graph*

*** Using the Health Department statistics on vaccinating 540,000 children, would result in:*

Up to 81,000 cases of rash and fever.

Up to 5,400 cases of parotid (mumps) swelling

Up to 216 cases of febrile seizures

Up to 18 cases of thrombocytopenia (red-blood cell destruction)

Up to cases of chronic thrombocytopenia.

Up to 5 cases of Aseptic Meningitis.

Up to 1 case of Central Nervous system damage.

Up to 15,420 cases of transient joint arthralgia some of these becoming chronic. (pg 95, H. Dept Handbook)

*** Germany does not routinely use the measles vaccine because their reporting system found 1 per 2,500 vaccinees had a neurological complication, and 1 per 17,500 vaccinees had abortive encephalopathy. (FDA Technical Report, 1980)*

*The Germans considered the risks too high in light of the fact that deaths and disease severity had decreased without any reference to a vaccine. * THE SAME IS TRUE OF NEW ZEALAND, but parents are not told that.*

*** That in the pre vaccine era, mothers' antibodies protected babies for around 15 months, measles was mainly an infection of 5 – 9 year olds, and by 15 yrs, 99% had antibodies. By 1985, 14 % of 15 year olds lacked antibody.(NZ Med J. 27 May, 1987) No-one knows what the level is now, but evidence from America shows that adult measles, which can be very serious, is now quite common.*

*** that vaccinated mothers cannot give protective antibodies to their babies, so that young babies, for whom measles is serious are no longer protected. (Washington Post, Sun Nov 22, 1992, and others)*

*"** that in the 1991 USA measles outbreak, over half the deaths were vaccinated, and most deaths were in immunocompromised people. (Washington Post June 14, 1991, BMJ, 11 May, 1991)*

*** that New Zealand doctors and hospitals do not prescribe or use Vitamin A for measles, and as a result, many cases are far more serious than they should be.*

*"** that in Africa, children who have a natural measles infection have half the asthma, allergies and eczema compared with their vaccinated peers. (Lancet, June 29, 1996)*

*** that if children with mild to moderate psoriasis get a natural dose of measles, the psoriasis is often cured. (3 med studies)*

*** that babies vaccinated who have maternal antibodies, or people who have measles suppressed with gammaglobulin go on to have a higher rate of immunoreactive diseases, sebaceous skin diseases, degenerative cartilage and bone disease and certain tumours. (Lancet, 5 Jan 1985) If you revaccinate children who already have antibodies what will happen to them in later life?*

*** that you have the right to take home the PRODUCT INSERT, and read it carefully before you make any decision".*

Scary isn't it? However she is not alone in her findings.

In the Indian Journal of Science a study was carried out and reported by Munesh K Sharma, Vikas Bhatia, HM Swami. **Outbreak of measles amongst vaccinated children** in a slum of Chandigarh

The abstract of this study says [https://pubmed.ncbi.nlm.nih.gov/14993716/] :

"*Background*: An outbreak of measles was reported from a slum, UT, Chandigarh in April 2003. Similar outbreak was also reported in less than three years from the same and adjoining areas. The present study was conducted to investigate and assess various epidemiological features associated with measles outbreak.

Material and Methods: Three cases of measles were admitted in Deptt. of Paediatrics, Govt. Medical College & Hospital, Chandigarh and were reported to the Deptt. of Community Medicine for an outbreak investigation. A trained team investigated the slum having a population of 25,000 and studied various features associated with epidemic between the period of April 22 to May 10, 2003.

Results: The study covered 484 houses having 1130 children. Among the children who developed measles 32.76% were vaccinated ones. In them attack rate was 3%. Attack rate in vaccinated children went on increasing as age increased. An overall attack rate of 5.13% (Peak incidence 6% in 1-4 years age group) was recorded. Among measles cases, one-fifth had post measles complications. As much as 32.76% children with measles had received measles vaccination in the past. Therefore something more than immunization by single dose of vaccine is required. Measles was reported to be higher amongst the children without Vitamin A supplementation (P<0.001).

Conclusion: There is need to store vaccine properly and to strengthen routine immunization coverage, Vitamin A supplementation and health infrastructure in underprivileged population. Serological studies among vaccinated children against measles should be undertaken to explore the possibility of second dose of measles in older children."

In another study by Russell W. Currier II, DVM; George E. Hardy, Jr., MD; J. Lyle Conrad, MD Measles in Previously Vaccinated Children they came to the conclusion that the measles vaccine was failing to protect children against measles, as in this study they also found cases of vaccinated children who contracted measles.

"Investigation of 37 cases of measles in an Alabama elementary school revealed that 25 patients (68%) had been vaccinated, suggesting measles vaccine failure. Attack rates based on a measles history and immunization survey indicated that 16.2% (six of 37) of measles susceptibles who responded acquired disease compared with only 4.0% (20 of 505) of vaccinated respondents. Analysis showed that 17.6% (12 of 68) of children vaccinated at less than 12 months of age contracted measles compared with only 1.9% (eight of 419) of those vaccinated at 12 or more months of age. It is inferred that vaccination at less than 1 year of age may not be effective, because maternal antibody may persist and interfere with immune response to vaccine virus. This would explain the higher incidence in this epidemic of measles among children vaccinated as infants."

If the conclusion that they came to was correct and ***that vaccination at less than 1 year of age may not be effective, because maternal antibody may persist and interfere with immune response to vaccine virus*** then surely this would indicate that the maternal antibody may have been enough to protect these infants and that the vaccine was counteracting a normal antibody passed from mother to infant.

One thing that is for certain it seems that at what ever age a child is given a vaccine it does not protect them from this illness and certainly vaccines have done very little to eradicate illnesses as we can clearly see.

I believe it is time that the world woke up to the fact that vaccinate or not, these illnesses are here to stay and the only thing that is being eradicated is the public's confidence in vaccinations.

Acquittement dans le procès du vaccin poliomyélite

RTBF Info, 16 mars 2011 à 11h35
https://web.archive.org/web/20110320023738/http://www.rtbf.be/info/societe/detail_acquittement-dans-le-proces-du-vaccin-poliomyelite?id=5781463

Le tribunal de Tournai devait rendre ce mercredi un jugement qui devrait interpeller tous les jeunes parents. Il concerne le vaccin contre la poliomyélite. Le seul vaccin obligatoire en Belgique.

Le père et la mère d'Olivier, 4 ans, étaient poursuivis devant le Tribunal Correctionnel pour avoir refusé de vacciner leur fils contre la polio, la poliomyélite, une maladie infectieuse et contagieuse qui s'attaque à la moelle épinière et qui peut provoquer la paralysie.

Ce vaccin est le seul obligatoire, en Belgique, et ne pas le faire représente un délit.
Chaque année des centaines de parents oublient ou se font tirer l'oreille pour finalement obtempérer, mais les parents d'Olivier, eux, n'ont pas voulu céder. Leur avocat, Philippe Vanlangendonck, explique qu'ils exigent avant tout des informations sur le produit qu'on injectera à leur enfant. "*Ils demandent des précisions et surtout des assurances permettant d'être rassurés par rapport à certaines craintes concernant la composition du vaccin puisqu'il contient certains produits comme de la formaldéhyde qui sont à considérer comme produits toxiques et cancérigènes".*

Et puis il y a ces effets secondaires que d'autres scientifiques soulèvent régulièrement enfin, les parents ne s'expliquent pas pourquoi ce vaccin est obligatoire en France, en Belgique, mais ne l'est plus en Allemagne ou au Pays Bas.

Pour Yves Vanlaethem, infectiologue et membre du conseil supérieur de la santé, ce vaccin est sans danger, il reste utile, même si on n'a plus relevé aucun cas de poliomyélite en Belgique depuis 1979. "*C'est une vaccination que l'on fait de manière altruiste, dans la mesure où, effectivement, actuellement le risque est nul chez nous mais le fait de continuer à protéger la population de manière suffisante qui permet que la réintroduction du virus sur notre continent par un voyageur venant d'Afrique ou d'Inde par exemple ne puisse provoquer une épidémie localement*".

Les parents d'Olivier eux ont donc enfreint une loi de 1966. Ils devaient connaître leur sort ce mercredi. Le tribunal a prononcé leur acquittemment.

Un jugement qui pourrait faire jurisprudence

Si le parquet ne va pas en appel, l'affaire pourrait faire jurisprudence. Le tribunal a donc acquitté la maman du petit garçon, considérant que le droit du patient, était prioritaire sur la loi de 1966, la loi qui rend ce vaccin obligatoire. Le droit du patient lui est inscrit dans une loi de 2002, il consacre le droit à l'information nécessaire pour obtenir le consentement éclairé du patient ou de sa famille avant tout acte médical. Et c'est bien ce que demandait la maman d'Olivier, une information complète sur la nature du produit injecté et sur les conséquences, les effets secondaires du vaccin. Ce qu'elle n'a pas pu obtenir. Le tribunal ordonne aussi qu'on apporte des réponses aux différentes questions que les parents se posent légitimement. Cet acquittement pourrait donc mettre un terme à l'obligation de vacciner contre la polio, une maladie qu'on n'a plus détecté en Belgique depuis 1979.

L'Allemagne, les Pays-Bas et la Grande Bretagne ont déjà retiré le vaccin contre la polio de la liste des vaccins obligatoires, ce qui n'est pas le cas de la France et de l'Italie.

Catherine J. Frompovich

Belgian Court Rules AGAINST Compulsory Vaccination

Vactruth, 28 April 2011
https://vactruth.com/2011/04/28/belgian-court-rules-against-compulsory-vaccination/

The Belgium court at Tournai recently ruled in favor of individual human rights when it rescinded Belgium's long-time mandatory polio vaccination law. That is a rather bold concession to and enforcement of individual human rights especially since the World Health Organization (WHO) in May 1974 initiated its Expanded Program on Immunization (EPI) to vaccinate all the children of the world.

Probably one of the issues authorities had to grapple with was: Children in Belgium are unlikely to get polio these days except when they receive the polio vaccine. What?

Yes, those children who do contract polio are getting it from the very vaccine that's supposed to 'immunize' them against it. That is not an anomaly in Belgium; it also has been happening in the United Kingdom.

Mad Cow Disease Connection to Polio Vaccine

Apparently, nvCJD, a new variant Creutzfeldt-Jakob disease [mad cow disease], was suspected as being connected to the polio vaccine in five males in Southampton, UK. Notices went out to the medical profession and the polio vaccine was withdrawn. Word about that problem spread throughout the European Union and parents became concerned about getting their children vaccinated against polio.

Parents Get Jail Sentence for Not Vaccinating Child Furthermore, parents in Belgium received jail sentences and fines in the past for not getting their children vaccinated with the mandatory polio vaccine. In February 2008, the British Medical Journal published the article "Belgian parents are sentenced to prison for not vaccinating children" [BMJ 2008; 336: 348]. According to the BMJ article, two sets of parents [four people] were fined $8,000 (U.S.) for each individual and sentenced to five months in prison early in February 2008. The judge convicted the parents on the basis of police reports. Even though there was a jail sentence handed down, colleagues in Belgium say they don't believe parents actually spent time behind bars.

The recent Belgian polio vaccine case regarding a four-year-old male child, Oliver Comblet, seems to be the impetus for the court's rescinding the mandatory polio vaccine law. Oliver's mother, Madame Comblet, asked :

"J'ai voulu obtenir des garanties avant de procéder à la vaccination et je voulais que mon petit garçon ne souffre pas d'effets secondaires liés à cette vaccination. Et c'est la raison pour laquelle j'avais posé toute une série de questions auxquelles même à ce jour, je n'ai malheureusement toujours pas pu obtenir de réponse;"

The parents' lawyer, Philippe Vanlangendonck, said they required the product information on what would be injected into their child. Basically, their attorney said, 'They ask for clarifications and assurances especially for reassurance over fears about the composition of the vaccine because it contains products such as formaldehyde that are considered toxic and carcinogenic.' Colleagues in

Belgium say Oliver's parents never received what they had asked for. However, there was acquittal in the trial.

=> https://web.archive.org/web/20111001000000*/http://beyondvaccination.com/showthread.php?2156-Polio-vaccine-probably-soon-no-more-compulsory-in-Belgium

Belgian Court's Acquittal

Apparently, the Belgian court realized the child's parents had every right to question formaldehyde being injected into their child. Personally, I applaud both the parents for standing their legal ground on protecting their child from physical medical abuse and the Belgian court for ruling as it did: Acquittal. When will that happen in the United States of America ?

According to the U.S. EPA, formaldehyde is a recognized carcinogen. It should not be an ingredient in any vaccine, nor should it be injected into any infant, toddler, teenager, adult, or senior citizen anywhere in the world. That is a similar version of mad science Adolph Hitler played around with in the 1930s and '40s, which the United States condemned, as did other countries of the world – even to fighting a war about it – and here we are in 2011 doing the same thing : Injecting carcinogens and other toxins like mercury, aluminum, polysorbate 80, industrial chemicals, foreign DNA, human diploid cells [aborted fetus cells] into humans under the guise of 'immunizing' them . Talk about mad science.

The Belgian court acquittal impacted the Royal Decree of 1966 that mandated vaccination against polio between the first 3 and 17 months of a child's life. That law, in effect, was canceled. The Patient Rights Law of August 22, 2002 prevails as a result. Vaccination now is elective NOT mandatory. That's the way it should be in a free society, especially when neurotoxins, carcinogens, poisons, foreign DNA, and industrial chemicals make up the vaccine—not salt water, as some physicians would have you believe. However, the Belgian government has decided to appeal the Tournai court ruling.

Furthermore, physicians in Belgium have legal and professional obligations to tell parents that there may be a problem with vaccination. Hallelujah! Hear that U.S. HHS, CDC, and FDA.

The Belgian case [Comblet] illustrates just how powerful parents' rights are and parents should not cave in to draconian pseudo-scientific pressuring by physicians who are tutored by Big Pharma. Parents have moral and legal rights to protect their children from physical harm and abuse, which jabbing neurotoxins and poisons into them definitey IS.

Patients' Rights

My highest compliments go to the Belgian court for its decision in favor of human rights.

April 18, 2011 was the European Day of Patients' Rights. Ironically, Belgium and France will celebrate the European Week of Vaccination from April 26 to May 2, 2011, which seems like either an anachronism or a paradox considering vaccinations are mandatory in both countries.

Needless to say, there are Belgian health consumer issues regarding patients' rights that are enumerated at http://www.initiativecitoyenne.be/ext/http://www.destinationsante.com/Quels-droits-pour-les-patients.html , which is in French.

Basically, there are Fourteen Patient Rights that Belgians want secured:

Right 1 : The Right of/to preventive measures
Right 2 : The Right of/to access
Right 3 : The Right of/to information
Right 4 : The Right of/to informed consent
Right 5 : The Right of/to free choice
Right 6 : The Right of/to privacy and confidentiality
Right 7 : The Right of/to immediate care for treatment
Right 8 : The Right of/to standards of quality
Right 9 : The Right of/to security
Right 10 : The Right of/to innovative procedures
Right 11 : The Right of/to avoidance of suffering and pain
Right 12 : The Right of/to treatment of one's personal choice
Right 13 : The Right of/to voice and file complaints
Right 14 : The Right of/to compensation

What an inspiration the people of Belgium should be for healthcare consumers in the United States. Personally, I think we should get our act together and work for the USA Day of Patient Rights AND fifty states individual State's Day of Patient Rights.

VANITY FAIR

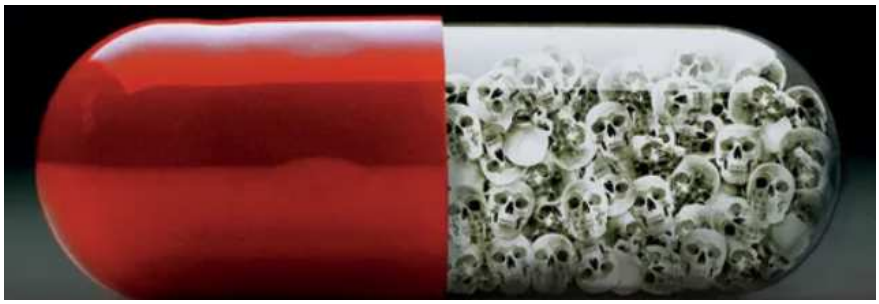
Donald L. Barlett, James B. Steele

Deadly Medicine

Vanity Fair, 2 December 2010 // January 2011 Issue
https://www.vanityfair.com/news/2011/01/deadly-medicine-201101?srsltid=AfmBOoqMq08rvrMD9qKKw8M9Fr_bjWCXq7VsS-XkmpX5Wk_W8Msstxtu

Prescription drugs kill some 200,000 Americans every year. Will that number go up, now that most clinical trials are conducted overseas – on sick Russians, homeless Poles, and slum-dwelling Chinese – in places where regulation is virtually nonexistent, the F.D.A. doesn't reach, and "mistakes" can end up in pauper's graves? The authors investigate the globalization of the pharmaceutical industry, and the U.S. Government's failure to rein in a lethal profit machine.

You wouldn't think the cities had much in common. Iaşi, with a population of 320,000, lies in the Moldavian region of Romania. Mégrine is a town of 24,000 in northern Tunisia, on the Mediterranean Sea. Tartu, Estonia, with a population of 100,000, is the oldest city in the Baltic States; it is sometimes called "the Athens on the Emajõgi." Shenyang, in northeastern China, is a major industrial center and transportation hub with a population of 7.2 million.



These places are not on anyone's Top 10 list of travel destinations. But the advance scouts of the pharmaceutical industry have visited all of them, and scores of similar cities and towns, large and small, in far-flung corners of the planet. They have gone there to find people willing to undergo clinical trials for new drugs, and thereby help persuade the U.S. Food and Drug Administration to declare the drugs safe and effective for Americans. It's the next big step in globalization, and there's good reason to wish that it weren't.

Once upon a time, the drugs Americans took to treat chronic diseases, clear up infections, improve their state of mind, and enhance their sexual vitality were tested primarily either in the United States (the vast majority of cases) or in Europe. No longer. As recently as 1990, according to the inspector general of the Department of Health and Human Services, a mere 271 trials were being conducted in foreign countries of drugs intended for American use. By 2008, the number had risen to 6,485 – an increase of more than 2,000 percent. A database being compiled by the National Institutes of Health has identified 58,788 such trials in 173 countries outside the United States since 2000. In 2008 alone, according to the inspector general's report, 80 percent of the applications submitted to the F.D.A. for new drugs contained data from foreign clinical trials. Increasingly, companies are

doing 100 percent of their testing offshore. The inspector general found that the 20 largest U.S.-based pharmaceutical companies now conducted "one-third of their clinical trials exclusively at foreign sites." All of this is taking place when more drugs than ever – some 2,900 different drugs for some 4,600 different conditions – are undergoing clinical testing and vying to come to market.

Some medical researchers question whether the results of clinical trials conducted in certain other countries are relevant to Americans in the first place. They point out that people in impoverished parts of the world, for a variety of reasons, may metabolize drugs differently from the way Americans do. They note that the prevailing diseases in other countries, such as malaria and tuberculosis, can skew the outcome of clinical trials. But from the point of view of the drug companies, it's easy to see why moving clinical trials overseas is so appealing. For one thing, it's cheaper to run trials in places where the local population survives on only a few dollars a day. It's also easier to recruit patients, who often believe they are being treated for a disease rather than, as may be the case, just getting a placebo as part of an experiment. And it's easier to find what the industry calls "drug-naïve" patients: people who are not being treated for any disease and are not currently taking any drugs, and indeed may never have taken any – the sort of people who will almost certainly yield better test results. (For some subjects overseas, participation in a clinical trial may be their first significant exposure to a doctor.) Regulations in many foreign countries are also less stringent, if there are any regulations at all. The risk of litigation is negligible, in some places nonexistent. Ethical concerns are a figure of speech. Finally – a significant plus for the drug companies – the F.D.A. does so little monitoring that the companies can pretty much do and say what they want.

Consent by Thumbprint

Many of today's trials still take place in developed countries, such as Britain, Italy, and Japan. But thousands are taking place in countries with large concentrations of poor, often illiterate people, who in some cases sign consent forms with a thumbprint, or scratch an "X." Bangladesh has been home to 76 clinical trials. There have been clinical trials in Malawi (61), the Russian Federation (1,513), Romania (876), Thailand (786), Ukraine (589), Kazakhstan (15), Peru (494), Iran (292), Turkey (716), and Uganda (132). Throw a dart at a world map and you are unlikely to hit a spot that has escaped the attention of those who scout out locations for the pharmaceutical industry.

The two destinations that one day will eclipse all the others, including Europe and the United States, are China (with 1,861 trials) and India (with 1,457). A few years ago, India was home to more American drug trials than China was, thanks in part to its large English-speaking population. But that has changed. English is now mandatory in China's elementary schools, and, owing to its population edge, China now has more people who speak English than India does.

While Americans may be unfamiliar with the names of foreign cities where clinical trials have been conducted, many of the drugs being tested are staples of their medicine cabinets. One example is Celebrex, a non-steroidal anti-inflammatory drug that has been aggressively promoted in television commercials for a decade. Its manufacturer, Pfizer, the world's largest drug company, has spent more than a billion dollars promoting its use as a pain remedy for arthritis and other conditions, including menstrual cramps. The National Institutes of Health maintains a record of most – but by no means all – drug trials inside and outside the United States. The database counts 290 studies involving Celebrex. Companies are not required to report—and do not report—all studies conducted overseas. According to the database, of the 290 trials for Celebrex, 183 took place in the United States, meaning, one would assume, that 107 took place in other countries. But an informal, country-by-country accounting by *VANITY FAIR* turned up no fewer than 207 Celebrex trials in at least 36 other countries. They ranged from 1 each in Estonia, Croatia, and Lithuania to 6 each in Costa Rica, Colombia, and Russia, to 8 in Mexico, 9 in China, and 10 in Brazil. But even these numbers understate the extent of the foreign trials. For example, the database lists five Celebrex trials in Ukraine, but just "one" of those trials involved studies in 11 different Ukrainian cities.

The Celebrex story does not have a happy ending. First, it was disclosed that patients taking the drug were more likely to suffer heart attacks and strokes than those who took older and cheaper

painkillers. Then it was alleged that Pfizer had suppressed a study calling attention to these very problems. (The company denied that the study was undisclosed and insisted that it "acted responsibly in sharing this information in a timely manner with the F.D.A.") Soon afterward the *Journal of the Royal Society of Medicine* reported an array of additional negative findings. Meanwhile, Pfizer was promoting Celebrex for use with Alzheimer's patients, holding out the possibility that the drug would slow the progression of dementia. It didn't. Sales of Celebrex reached $3.3 billion in 2004, and then began to quickly drop.

"Rescue Countries"

One big factor in the shift of clinical trials to foreign countries is a loophole in F.D.A. regulations: if studies in the United States suggest that a drug has no benefit, trials from abroad can often be used in their stead to secure F.D.A. approval. There's even a term for countries that have shown themselves to be especially amenable when drug companies need positive data fast: they're called "rescue countries." Rescue countries came to the aid of Ketek, the first of a new generation of widely heralded antibiotics to treat respiratory-tract infections. Ketek was developed in the 1990s by Aventis Pharmaceuticals, now Sanofi-Aventis. In 2004 – on April Fools' Day, as it happens – the F.D.A. certified Ketek as safe and effective. The F.D.A.'s decision was based heavily on the results of studies in Hungary, Morocco, Tunisia, and Turkey.

The approval came less than one month after a researcher in the United States was sentenced to 57 months in prison for falsifying her own Ketek data. Dr. Anne Kirkman-Campbell, of Gadsden, Alabama, seemingly never met a person she couldn't sign up to participate in a drug trial. She enrolled more than 400 volunteers, about 1 percent of the town's adult population, including her entire office staff. In return, she collected $400 a head from Sanofi-Aventis. It later came to light that the data from at least 91 percent of her patients was falsified. (Kirkman-Campbell was not the only troublesome Aventis researcher. Another physician, in charge of the third-largest Ketek trial site, was addicted to cocaine. The same month his data was submitted to the F.D.A. he was arrested while holding his wife hostage at gunpoint.) Nonetheless, on the basis of overseas trials, Ketek won approval.

As the months ticked by, and the number of people taking the drug climbed steadily, the F.D.A. began to get reports of adverse reactions, including serious liver damage that sometimes led to death. The F.D.A.'s leadership remained steadfast in its support of the drug, but criticism by the agency's own researchers eventually leaked out (a very rare occurrence in this close-knit, buttoned-up world). The critics were especially concerned about an ongoing trial in which 4,000 infants and children, some as young as six months, were recruited in more than a dozen countries for an experiment to assess Ketek's effectiveness in treating ear infections and tonsillitis. The trial had been sanctioned over the objections of the F.D.A.'s own reviewers. One of them argued that the trial never should have been allowed to take place – that it was "inappropriate and unethical because it exposed children to harm without evidence of benefits." In 2006, after inquiries from Congress, the F.D.A. asked Sanofi-Aventis to halt the trial. Less than a year later, one day before the start of a congressional hearing on the F.D.A.'s approval of the drug, the agency suddenly slapped a so-called black-box warning on the label of Ketek, restricting its use. (A black-box warning is the most serious step the F.D.A. can take short of removing a drug from the market.) By then the F.D.A. had received 93 reports of severe adverse reactions to Ketek, resulting in 12 deaths.

During the congressional hearings, lawmakers heard from former F.D.A. scientists who had criticized their agency's oversight of the Ketek trials and the drug-approval process. One was Dr. David Ross, who had been the F.D.A.'s chief reviewer of new drugs for 10 years, and was now the national director of clinical public-health programs for the U.S. Department of Veterans Affairs. When he explained his objections, he offered a litany of reasons that could be applied to any number of other drugs: "Because F.D.A. broke its own rules and allowed Ketek on the market. Because dozens of patients have died or suffered needlessly. Because F.D.A. allowed Ketek's maker to experiment with it on children over reviewers' protests. Because F.D.A. ignored warnings about fraud. And because F.D.A. used data it knew were false to reassure the public about Ketek's safety."

Trials and Error

To have an effective regulatory system you need a clear chain of command – you need to know who is responsible to whom, all the way up and down the line. There is no effective chain of command in modern American drug testing. Around the time that drugmakers began shifting clinical trials abroad, in the 1990s, they also began to contract out all phases of development and testing, putting them in the hands of for-profit companies. It used to be that clinical trials were done mostly by academic researchers in universities and teaching hospitals, a system that, however imperfect, generally entailed certain minimum standards. The free market has changed all that. Today it is mainly independent contractors who recruit potential patients both in the U.S. and – increasingly – overseas. They devise the rules for the clinical trials, conduct the trials themselves, prepare reports on the results, ghostwrite technical articles for medical journals, and create promotional campaigns. The people doing the work on the front lines are not independent scientists. They are wage-earning technicians who are paid to gather a certain number of human beings; sometimes sequester and feed them; administer certain chemical inputs; and collect samples of urine and blood at regular intervals. The work looks like agribusiness, not research.

What began as a mom-and-pop operation has grown into a vast army of formal "contract-research organizations" that generate annual revenue of $20 billion. They can be found conducting trials in every part of the world. By far the largest is Quintiles Transnational, based in Durham, North Carolina. It offers the services of 23,000 employees in 60 countries, and claims that it has "helped develop or commercialize all of the top 30 best-selling drugs."

Quintiles is privately owned – its investors include two of the U.S.'s top private-equity firms. Other private contractors are public companies, their stock traded on Wall Street. Pharmaceutical Product Development (P.P.D.), a full-service medical contractor based in Wilmington, North Carolina, is a public company with 10,500 employees. It, too, has conducted clinical trials all around the world. In fact, it was involved in the clinical trials for Ketek – a P.P.D. research associate, Ann Marie Cisneros, had been assigned to monitor Dr. Anne Kirkman-Campbell's testing in Alabama. Cisneros later told the congressional investigating committee that Kirkman-Campbell had indeed engaged in fraud. "But what the court that sentenced her did not know," Cisneros said, was that "Aventis was not a victim of this fraud." Cisneros said she had reported her findings of fraud to her employer, P.P.D., and also to Aventis. She told the congressional committee, "What brings me here today is my disbelief at Aventis's statements that it did not know that fraud was being committed. Mr. Chairman, I knew it, P.P.D. knew it, and Aventis knew it." Following her testimony the company released a statement saying it regretted the violations that occurred during the study but was not aware of the fraud until after the data was submitted to the F.D.A.

The F.D.A., the federal agency charged with oversight of the food and drugs that Americans consume, is rife with conflicts of interest. Doctors who insist the drug you take is perfectly safe may be collecting hundreds of thousands of dollars from the company selling the drug. (ProPublica, an independent, nonprofit news organization that is compiling an ongoing catalogue of pharmaceutical-company payments to physicians, has identified 17,000 doctors who have collected speaking and consulting fees, including nearly 400 who have received $100,000 or more since 2009.) Quite often, the F.D.A. never bothers to check for interlocking financial interests. In one study, the agency failed to document the financial interests of applicants in 31 percent of applications for new-drug approval. Even when the agency or the company knew of a potential conflict of interest, neither acted to guard against bias in the test results.

Because of the deference shown to drug companies by the F.D.A. – and also by Congress, which has failed to impose any meaningful regulation—there is no mandatory public record of the results of drug trials conducted in foreign countries. Nor is there any mandatory public oversight of ongoing trials. If one company were to test an experimental drug that killed more patients than it helped, and kept the results secret, another company might unknowingly repeat the same experiment years later, with the same results. Data is made available to the public on a purely voluntary basis. Its accuracy

is unknown. The oversight that does exist often is shot through with the kinds of ethical conflicts that Wall Street would admire. The economic incentives for doctors in poor countries to heed the wishes of the drug companies are immense. An executive at a contract-research organization told the anthropologist Adriana Petryna, author of the book *When Experiments Travel:* "In Russia, a doctor makes two hundred dollars a month, and he is going to make five thousand dollars per Alzheimer's patient" that he signs up. Even when the most flagrant conflicts are disclosed, penalties are minimal. In truth, the same situation exists in the United States. There's just more of a chance here, though not a very large one, that adverse outcomes and tainted data will become public. When the pharmaceutical industry insists that its drugs have been tested overseas in accordance with F.D.A. standards, this may be true – but should provide little assurance.

The F.D.A. gets its information on foreign trials almost entirely from the companies themselves. It conducts little or no independent research. The investigators contracted by the pharmaceutical companies to manage clinical trials are left pretty much on their own. In 2008 the F.D.A. inspected just 1.9 percent of trial sites inside the United States to ensure that they were complying with basic standards. Outside the country, it inspected even fewer trial sites – seven-tenths of 1 percent. In 2008, the F.D.A. visited only 45 of the 6,485 locations where foreign drug trials were being conducted.

The pharmaceutical industry dismisses concerns about the reliability of clinical trials conducted in developing countries, but the potential dangers were driven home to Canadian researchers in 2007. While reviewing data from a clinical trial in Iran for a new heart drug, they discovered that many of the results were fraudulent. "It was bad, so bad we thought the data was not salvageable," Dr. Gordon Guyatt, part of the research group at McMaster University in Hamilton, told Canada's *National Post.*

In addition to monitoring trials abroad, which it does not really do, the F.D.A. is responsible for inspecting drug-manufacturing plants in other countries, which it also does not really do. In 2007 and 2008, hundreds of patients taking the blood thinner heparin, which among other purposes is used to prevent blood clots during surgery and dialysis, developed serious allergic reactions as a result of a contaminant introduced at a Chinese manufacturing facility. It took months for the F.D.A., its Chinese counterpart, and Baxter International, the pharmaceutical company that distributed the drug, to track the source of contamination to Changzhou, a city of 3.5 million on the Yangtze River.

The delay was perhaps understandable, given the manufacturing process. The raw material for Baxter's heparin comes from China's many small pig farms. To be precise, it's derived from the mucous membranes of the intestines of slaughtered pigs; the membranes are mixed together and cooked, often in unregulated family workplaces. By the time the source of the contaminant was pinpointed, many more patients in the United States had experienced severe reactions, and as many as 200 had died. It later turned out that the F.D.A. had indeed inspected a Chinese plant – but it was the wrong one. The federal regulators had confused the names.

The good news was that, in this instance, the F.D.A. at least knew which country the heparin had come from. The bad news is that it does not always know where clinical trials are being conducted, or even the names or types of drugs being tested, or the purpose for which they will be prescribed once approved. Companies may withhold the foreign test data until they actually submit the application to the F.D.A. for approval. By then the agency has lost the ability to see whether the trials were managed according to acceptable standards, and whether the data collected was manipulated or fabricated.

$350 per Child

If the globalization of clinical trials for adult medications has drawn little attention, foreign trials for children's drugs have attracted even less. The Argentinean province of Santiago del Estero, with a population of nearly a million, is one of the country's poorest. In 2008 seven babies participating in drug testing in the province suffered what the U.S. clinical-trials community refers to as "an adverse event": they died. The deaths occurred as the children took part in a medical trial to test the safety of a new vaccine, Synflorix, to prevent pneumonia, ear infections, and other pneumococcal

diseases. Developed by GlaxoSmithKline, the world's fourth-largest pharmaceutical company in terms of global prescription-drug sales, the new vaccine was intended to compete against an existing vaccine. In all, at least 14 infants enrolled in clinical trials for the drug died during the testing. Their parents, some illiterate, had their children signed up without understanding that they were taking part in an experiment. Local doctors who persuaded parents to enroll their babies in the trial reportedly received $350 per child. The two lead investigators contracted by Glaxo were fined by the Argentinean government. So was Glaxo, though the company maintained that the mortality rate of the children "did not exceed the rate in the regions and countries participating in the study." No independent group conducted an investigation or performed autopsies. As it happens, the brother of the lead investigator in Santiago del Estero was the Argentinean provincial health minister.

In New Delhi, 49 babies died at the All India Institute of Medical Sciences while taking part in clinical trials over a 30-month period. They were given a variety of new drugs to treat everything from high blood pressure to chronic focal encephalitis, a brain inflammation that causes epileptic seizures and other neurological problems. The blood-pressure drugs had never before been given to anyone under 18. The editor of an Indian medical journal said it was obvious that the trials were intended to extend patent life in Western countries "with no consequence or benefit for India, using Indian children as guinea pigs." In all, 4,142 children were enrolled in the studies, two-thirds of them less than one year old. But the head of the pediatrics department at the All India Institute maintained that "none of the deaths was due to the medication or interventions used in clinical trials."

For years, American physicians gave anti-psychotic medicines to children "off label," meaning that they wrote prescriptions based on testing for adults, sometimes even for different conditions. That didn't work out so well for the children, who, when it comes to medicine, really are not just little adults. To provide the pharmaceutical industry with an incentive to conduct clinical trials on children's versions of adult drugs, Congress in 1997 enacted legislation, known as the Pediatric Exclusivity Provision, extending the patent life of certain drugs by six months. It worked so well that the industry has, in the ensuing years, been able to put younger and younger children on more and more drugs, pocketing an extra $14 billion. Between 1999 and 2007, for instance, the use of anti-psychotic medications on children between the ages of two and five more than doubled.

A study of 174 trials under the Pediatric Exclusivity Provision found that 9 percent of them did not report the location or number of sites of the clinical trials. Of those that did, two-thirds had been conducted in at least one country outside the United States, and 11 percent were conducted entirely outside the United States. Of the 79 trials with more than 100 subjects participating, 87 percent enrolled patients outside the United States. As is the case with adult studies, many children's trials conducted abroad are neither reported nor catalogued on any publicly accessible government database. There is no public record of their existence or their results.

In the mid-90s, Glaxo conducted clinical trials on the antidepressant Paxil in the United States, Europe, and South America. Paxil is a member of a class of drugs called selective serotonin re-uptake inhibitors. The class includes Zoloft, Prozac, and Lexapro. In the United Kingdom, Paxil is sold as Seroxat. The clinical trials showed that the drug had no beneficial effect on adolescents; some of the trials indicated that the placebo was more effective than the drug itself. But Glaxo neglected to share this information with consumers; annual sales of the drug had reached $5 billion in 2003. In an internal document obtained by the *Canadian Medical Association Journal,* the company emphasized how important it was to "effectively manage the dissemination of these data in order to minimize any potential negative commercial impact." The memo went on to warn that "it would be commercially unacceptable to include a statement that efficacy had not been demonstrated." After the document was released a Glaxo spokesperson said that the "memo draws an inappropriate conclusion and is not consistent with the facts."

"Smoke and Mirrors"

It may be just a coincidence, but as controversy swirls around new drugs, and as the F.D.A. continues to slap medicines with new warning labels – especially the black-box warnings that

indicate the most serious potential reactions – most of the problematic drugs have all undergone testing outside the United States. Clinical-trial representatives working for GlaxoSmithKline went to Iaşi, Romania, to test Avandia, a diabetes drug, on the local population. Glaxo representatives also showed up in other cities in Romania – Bucureşti, Cluj-Napoca, Craiova, and Timişoara – as well as multiple cities in Latvia, Ukraine, Slovakia, the Russian Federation, Poland, Hungary, Lithuania, Estonia, the Czech Republic, Bulgaria, Croatia, Greece, Belgium, the Netherlands, Germany, France, and the United Kingdom. That was for the largest of the Avandia clinical trials. But there have been scores of others, all seeking to prove that the drug is safe and effective. Some took place before the drug was approved by the F.D.A. Others were "post-marketing" studies, done after the fact, as the company cast about for ways to come up with more positive results so it could expand Avandia's use for other treatments. Based on the initial evaluations, Avandia was expected to – and did – become another Glaxo multi-billion-dollar best-seller.

While sales soared, so, too, did reports of adverse reactions – everything from macular edema to liver injury, from bone fractures to congestive heart failure. In 2009 the Institute for Safe Medication Practices, a Pennsylvania-based nonprofit group that monitors the prescription-drug field, linked the deaths of 1,354 people to Avandia, based on reports filed with the F.D.A. Studies also concluded that people taking the drug had an increased risk of developing heart disease, one of the very conditions that doctors treating diabetics hope to forestall. The risk was so high that worried doctors inside and outside the F.D.A. sought to have the drug removed from the market, an incredibly difficult task no matter how problematic the medicine. As always, the F.D.A. was late to the party. In 2008 the American Diabetes Association and the European Association for the Study of Diabetes had warned against using Avandia. The Saudi Arabian drug-regulatory agency yanked it from the market, and the Indian government asked Glaxo to halt 19 of its Avandia trials in that country. In September 2010 the European Medicines Agency pulled Avandia from the shelves all across Europe. The F.D.A. still could not bring itself to take decisive action. This even though the F.D.A. knew that Glaxo had withheld critical safety information concerning the increased risk of heart attacks, and the F.D.A. itself had estimated that the drug had caused more than 83,000 heart attacks between 1999 and 2007. The agency settled for imposing new restrictions on the availability of the drug in the United States. Glaxo released a statement saying that it "continues to believe that Avandia is an important treatment for patients with type 2 diabetes," but that it would "voluntarily cease promotion of Avandia in all the countries in which it operates."

The Avandia case and others like it have prompted the U.S. Justice Department to mount an investigation under the Foreign Corrupt Practices Act. While it is legal for doctors in this country to accept money from drug companies for acting as consultants, this is not the case abroad, where doctors often are government employees, and such payments can be considered bribes. There are other legal issues. So far, Glaxo has paid out more than $1 billion to settle lawsuits arising from claims against Avandia and other drugs. The Senate Finance Committee calculates that, since May 2004, seven drug companies have paid out more than $7 billion in fines and penalties stemming from unlawful drug dealings. Pfizer paid the largest such fine in history – $2.3 billion for promoting off-label uses of the arthritis drug Bextra.

In theory, pharmaceutical companies are barred from selling a drug for any purpose other than the one that the F.D.A. has approved on the basis of clinical testing. But the reality is different. The minute a drug receives the green light from the F.D.A. for a specific treatment, the sponsoring company and its allies begin campaigns to make it available for other purposes or for other types of patients. The antidepressant Paxil was tested on adults but sold off-label to treat children. Seroquel, an anti-psychotic, was marketed as a treatment for depression. Physicians, often on retainer from pharmaceutical companies, are free to prescribe a drug for any reason if they entertain a belief that it will work. This practice turns the population at large into unwitting guinea pigs whose adverse reactions may go unreported or even unrecognized.

To secure the F.D.A.'s approval for Seroquel, which ultimately would go to treat schizophrenia, bipolar disorders, and manic episodes associated with bipolar disorder, AstraZeneca, the fifth-

largest pharmaceutical company, conducted clinical trials across Asia, Europe, and the United States. Among the sites: Shenyang and more than a dozen other cities in China, and multiple cities in Bulgaria, Estonia, Hungary, Latvia, Lithuania, Croatia, Indonesia, Malaysia, Poland, the Russian Federation, Serbia, Ukraine, and Taiwan. The F.D.A. initially approved the drug for the treatment of schizophrenia. But while schizophrenia may have opened the door, off-label sales opened the cash register. Money poured in by the billions as AstraZeneca promoted the drug for the treatment of any number of other conditions. It was prescribed for children with autism-spectrum disorders and retardation as well as for elderly Alzheimer's patients in nursing homes. The company touted the drug for treatment of aggression, anxiety, anger-management issues, attention-deficit hyperactivity disorder, dementia, and sleeplessness. Up to 70 percent of the prescriptions for Seroquel were written for a purpose other than the one for which it had been approved, and sales rose to more than $4 billion a year.

It turned out, however, that AstraZeneca had been less than candid about the drug's side effects. One of the most troubling: patients often gained weight and developed diabetes. This meant a new round of drugs to treat conditions caused by Seroquel. In an internal e-mail from 1997 discussing a study comparing Seroquel with an older anti-psychotic drug, Haldol, a company executive praised the work of the project physician, saying she had done a great "smoke-and-mirrors job," which "should minimize (and dare I venture to suggest) could put a positive spin (in terms of safety) on this cursed study." After the e-mail was disclosed, in February 2009, the company said that the document cannot "obscure the fact that AstraZeneca acted responsibly and appropriately as it developed and marketed" the drug. In April, AstraZeneca reached a half-billion-dollar settlement with the federal government over its marketing of Seroquel. The U.S. attorney in Philadelphia, where the settlement was filed, declared that the company had "turned patients into guinea pigs in an unsupervised drug test." Meanwhile, the company was facing more than 25,000 product-liability lawsuits filed by people who contended the drug had caused their diabetes.

Death Toll

The only people who seem to care about the surge of clinical trials in foreign countries are the medical ethicists – not historically a powerhouse when it comes to battling the drug companies. A team of physician-researchers from Duke University, writing last year in the *New England Journal of Medicine,* observed that "this phenomenon raises important questions about the economics and ethics of clinical research and the translation of trial results to clinical practice: Who benefits from the globalization of clinical trials? What is the potential for exploitation of research subjects? Are trial results accurate and valid, and can they be extrapolated to other settings?" The Duke team noted that, in some places, "financial compensation for research participation may exceed participants' annual wages, and participation in a clinical trial may provide the only access to care" for those taking part in the trial. In 2007, residents of a homeless shelter in Grudziadz, Poland, received as little as $2 to take part in a flu-vaccine experiment. The subjects thought they were getting a regular flu shot. They were not. At least 20 of them died. The same distorting economic pressures exist for local hospitals or doctors, who may collect hundreds of dollars for every patient they enroll. In theory, a federal institutional review board is supposed to assess every clinical trial, with special concern for the welfare of the human subjects, but this work, too, has now been outsourced to private companies and is often useless.

In 2009 the Government Accountability Office conducted a sting operation, winning approval for a clinical trial involving human subjects; the institutional review board failed to discover (if it even tried) that it was dealing with "a bogus company with falsified credentials" and a fake medical device. This was in Los Angeles. If that is oversight in the U.S., imagine what it's like in Kazakhstan or Uganda. Susan Reverby, the Wellesley historian who uncovered the U.S. government's syphilis experiments in Guatemala during the 1940s, was asked in a recent interview to cite any ongoing experimental practices that gave her pause. "Frankly," she said, "I am mostly worried about the drug trials that get done elsewhere now, which we have little control over."

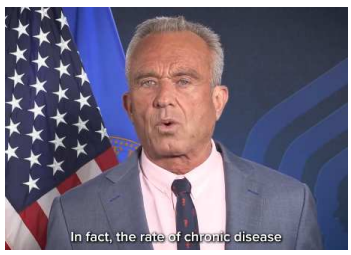
The pharmaceutical industry, needless to say, has a different view. It argues that people participating in a clinical trial may be getting the highest quality of medical care they have ever received. That may be true in the short term. But, unfortunately, the care lasts only until the trial is completed. Many U.S. medical investigators who manage drug trials abroad say they prefer to work overseas, where regulations are lax and "conflict of interest" is a synonym for "business as usual." Inside the United States, doctors who oversee trials are required to fill out forms showing any income they have received from drug companies so as to guard against financial biases in trials. This explains in part why the number of clinical-trial investigators registered with the F.D.A. fell 5.2 percent in the U.S. between 2004 and 2007 while increasing 16 percent in Eastern Europe, 12 percent in Asia, and 10 percent in Latin America. In a recent survey, 70 percent of the eligible U.S. and Western European clinical investigators interviewed said they were discouraged by the current regulatory environment, partly because they are compelled to disclose financial ties to the pharmaceutical industry. In trials conducted outside the United States, few people care.

In 2009, according to the Institute for Safe Medication Practices, 19,551 people died in the United States as a direct result of the prescription drugs they took. That's just the reported number. It's decidedly low, because it is estimated that only about 10 percent of such deaths are reported. Conservatively, then, the annual American death toll from prescription drugs considered "safe" can be put at around 200,000. That is three times the number of people who die every year from diabetes, four times the number who die from kidney disease. Overall, deaths from F.D.A.-approved prescription drugs dwarf the number of people who die from street drugs such as cocaine and heroin. They dwarf the number who die every year in automobile accidents. So far, these deaths have triggered no medical crusades, no tough new regulations. After a dozen or so deaths linked to runaway Toyotas, Japanese executives were summoned to appear before lawmakers in Washington and were subjected to an onslaught of humiliating publicity. When the pharmaceutical industry meets with lawmakers, it is mainly to provide campaign contributions.

And with more and more of its activities moving overseas, the industry's behavior will become more impenetrable, and more dangerous, than ever.

HHS Announces Transformation to Make America Healthy Again

U.S. Department of HHS, 27 March 2025
https://www.youtube.com/watch?v=O8qQxLYTyV8



"We are streamlining HHS to make our agency more efficient and more effective. We will eliminate an entire alphabet soup of departments, while preserving their core functions by merging them into a new organization called the Administration for a Healthy America or AHA. This overhaul will improve the health of the entire nation — to Make America Healthy Again." - Secretary Kennedy

"Our department is filled, for the most part, with competent, conscientious public servants," the secretary said, noting that while HHS' budget and staffing have experienced tremendous increases, "*all that money has failed to improve the health of Americans*":

In fact, the rate of chronic disease and cancer increased dramatically. *As our department has grown, our lifespan has dropped*. So, *Americans now live six years shorter than Europeans*. *We have the sickest nation in the world, and we have the highest rate of chronic disease*.

US ranks last among 40 developed nations in terms of health, but we spend two to three times more per capita than those nations.

As Secretary, I now understand why all this money is not improving our health: HHS is a sprawling bureaucracy that encompasses literally hundreds of departments, committees and other offices.

Depopulation Through Forced Vaccination: *The Zero Carbon Solution!*

"The world today has 6.8 billion people. That's headed up to about 9 billion. Now if we do a really great job on new vaccines, health care, reproductive health services, we lower that by perhaps 10 or 15 percent."
Billy 'The Kid Killer' Gates

By Rachel Windeer

On April 26th, the Irish Independent published an article titled 'Concern for Children's Health as Parents ignoring vaccines'. Edel Kennedy, you should be ashamed of yourself! This is nothing less than an attempt by government, through their puppets in the media, to remove the rights of parents to determine the life choices of their offspring and removes any doubt that we now live in a dictatorship.

This is an OUTRAGEOUS insult to every parent in the country who has the common sense to research the efficacy of vaccines themselves by simply looking at the historical record rather than trust politicians whose lies in the media, including those perpetrated by the Dept. of Health under Mary Harney regarding the farce of 'swine flu' and the dangerous myth of HPV vaccination, have led the country into the abyss of utter poverty and sold the country into the communist grasp of European bureaucrats whose sole aim is the destruction of every member nation's sovereignty leaving them clutching at the bailout begging bowl of the IMF.

Vaccines are a fraud; pure and simple! The historical record PROVES this for anyone with a little patience and the courage to investigate the FACTS for themselves, and it does take courage, especially for those in the medical profession whose careers will be at risk if they dare expose this danger to our children. It also shatters their illusions that they're part of an organisation which is far from beneficial to those they believe they're protecting from illness.

However, their hypocratic oath should compel them to investigate such wild claims put out by pharmaceutical giants and their drug dealer sales representatives instead of taking the word of an industry well known as being utterly corrupt and ruthless in its business practices.

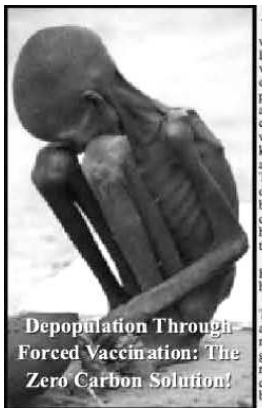
The Irish haemophiliac scandal, where patients were knowingly infected with HIV through contaminated blood products should be enough to convince anyone of Big Pharma's murderous intent.

This brings us to the real reasons for vaccinations. I'm not even going to prove to readers that they don't work. I'll simply urge you to look up the historical record. One simple example is the demise of measles.

The measles death rate had declined by 98% from 1915-1958 prior to any vaccination being introduced. In 1988 and 1989, 69% and 89% for measles cases in American school-aged children had been vaccinated! In 1995 56% of ALL measles cases in America were vaccinated.

These figures come from medical journals.

Those 3 simple examples PROVE that unvaccinated children are less likely to contract measles and that the vaccine



....Continued from page 1

was useless!
Look that up for yourself! All other vaccine claims that they've cured or eliminated disease follow a similar pattern. Better hygiene, clean water and good healthy food was the cause of the decline and any doctor worth his smelling salts should know that. If they don't then they are misinformed on a grand scale.
Therein lies the problem. Why have doctors been 'indoctrinated' to believe that vaccines are the sacred cow of medicine when the historical record clearly shows that they are virtually useless?

Hold onto your sanity because I have some bad news for you.

The real reason for vaccinations, apart from the massive profits to the manufacturers, is to ensure that you get sick throughout your life, again not only to enrich these same corporations that made you sick, but to ensure that many, if not all of you die before you ever receive your pension and when you are no longer any use to society. That's why they want you retiring later in life and are forcing you through economic terrorism to work longer regardless of your age or health. They want to work you to death.

You will be classed as a burden to society, a financial cost which society has to bear and therefore you will be stigmatised as a 'useless eater'; a consumer of resources needed for the rest of society. When Big Pharma can no longer profit from the illness they gave you, you will be left to die.

This is the depopulation agenda promoted under the United Nations Division of Population under the Department Economic and Social Affairs.
We only need look at Africa, the nation which the United Nations has said themselves, could feed the world. Why then are millions in Africa starving to death on that continent? It's meant to be that way folks!
All of us at one time or another have been led to believe in the efficacy of vaccines. I was one of them and had my child vaccinated nearly 30 years ago. I wouldn't even dream of it now!

I think it's safe to say that we're all aware of the real pandemic, as opposed to the fake pandemics of the past. It's called 'CANCER'. Prior to mass vaccination, cancers were extremely rare, as in almost non-existent. Today in the western, so called developed world, we face a crisis of cancer to the extent that, between one in five to one in two will suffer, many dying, from one form of cancer or another.

What's happened to cause this pandemic?

We only have to look back at the Jonas Salk polio vaccine that went around the world in the full knowledge that it contained the SV40 virus which had no other purpose than causing cancer yet it was pushed as a vaccine for polio when, as with measles, polio was well in decline prior to any vaccine due to the same factors.

Enter stage right at the TED 2010 conference, Mr. Bill Gates, head of Microsoft, the biggest computer firm on the planet. What has Bill gates to do with vaccines you're wondering?

See the quote on the front page. Those are his EXACT words

Are you beginning to get the picture?

The globalist elite care nothing for humanity; ordinary men, women and children must be eliminated in their delusional minds to ensure that their superior types go into the future with the best of breeding being the only criteria worthy of saving. You and I are no longer required and that is why we are seeing the loss of our economy, our wealth, our health, our happiness and ultimately, OUR

On April 26th, the Irish Independent published an article titled 'Concern for Children's Health as Parents ignoring vaccines'. Edel Kennedy, you should be ashamed of yourself! This is nothing less than an attempt by government, through their puppets in the media, to remove the rights of parents to determine the life choices of their offspring and removes any doubt that we now live in a dictatorship.

This u an Outrageous insult to every parent in the country who has the common sense to research the efficacy of vaccines themselves by simply looking at the historical record rather than trust politicians whose lies in the media, including those perpetrated by the Dept of Health under Mary Horney regarding the farce of 'swine flu' and the dangerous myth of HPV vaccination, have led the country into the abyss of utter poverty and sold the country into the communist grasp of European bureaucrats whose sole aim is the destruction of every member nation's sovereignty leaving them clutching at the bailout begging bowl of the IMF

Vaccines are a fraud; pure and simpk! The historical record Proves this for anyone with a little patience and the courage to investigate the facts for themselves, and it does take courage, especially for those in the medical profession whose careers will be at risk if they dare expose this danger to our children. It also shatters their illusions that they're pan of an organisation which is far from beneficial to those they believe they're protecting from illness.

However their hypocratic oath should compel them to investigate such wild claims put out by pharmaceutical giants and their drug dealer Saks representatives instead of taking the word of an industry well known as being utterly corrupt and ruthless in its business practices.

The Irish haemophiliac scandal, where patients were knowingly infected with HIV through contaminated blood products should be enough to convince anyone of Big Phanna's murderous intent.

This brings us to the real reasons for vaccinations. I'm not even going to prove to readers that they don't work. I'll simply urge you to look up the historical record. One simple example is the demise of measles.

The measles death rate had declined by 98% from 1915-1958 prior to any caccinanon being introduced. In 1988 and 1989, 69% and 89% for measles cases in American school-aged children had been vaccinated! In 1995, 56% of ALL measles cases in America were veccinated.

These figures come from medical journals. Those 3 simple examples prove that unvaccinated children are less likely to contract measles and that the vaccine was useless!

Look that up for yourself! All other vaccine claims that they've cured or eliminated disease follow a similar patient. Better hygiene, clean water and good healthy food was the cause of the decline and any doctor worth his smelling salts should know that. If they don't then they arc misinfomied on a grand scale. Therein lies the problem. Why have doctors been 'indocuntated' to believe that vaccines are the sacred cow of medicine when the historical record clearly shows that they are virtually useless?

Hold onto your sanity because I have some had news for you.

The real reason for vaccinations, apart from the massive profits to the manufacturers, is to ensure that you get sick throughout your life, again not only to enrich these same corporations that made you sick, but to ensure that many, if not all of you die before you ever receive your pension and when you are no longer any use to society. That's why they want you retiring later in life and are forcing you through economic terrorism to work longer regardless of your age or health. They want to work you to death.

You will be classed as a burden to society, a financial cost which society has to bear and therefore you will be stigmatised as a 'useless eater'; a consumer of resources needed for the rest of society. When Big Pharma can no longer profit from the illness they gave you, you will be left to die.

This is the depopulation agenda promoted under the United Nations Division of Population under the Department Economic and Social Affairs.

We only need look at Africa, the nation which the United Nations has said themselves, could feed the world. Why then are millions in Africa starving to death on that continent? It's meant to be that way folks!

All of to at one time or another have been led to believe in the efficacy of vaccines. I was one of them and had my child vaccinated nearly 30 years ago. I wouldn't even dream of it now!

I think it's safe to say that were all aware of the real pandemic, as opposed to the fake pandemics of the past. It's called 'cancer'. Prior to mass vaccination, cancers was extremely rare, as in almost non-existent. Today in the western. so called developed world, we face a crisis of cancer to the extolt that, between one in five to one in two will suffer, many dying, from one form of cancer or another.

What's happened to cause this pandemic?

We only have to look back at the Jonas Salk polio vaccine that went around the world in the full knowledge that it contained the SV40 virus which had no other purpose than causing cancer yet it was pushed as a vaccine for polio when, as with measles, polio was well in decline prior to any vaccine due to the same factors.

Enter stage right at the TED 2010 conference. Mr. Bill Gates, head of Microsoft, the biggest computer firm on the planet. What has Bill gates to do with vaccines you're wondering? See the quote on the front page Those ore hu exact words...

Are you beginning to get the picture?

The globalist elite care nothing for humanity: ordinary men, women and children must be eliminated in their delusional minds to ensure that their superior types go into the future with the best of breeding being the only criteria worthy of saving. You and I are no longer required and that is why we are seeing the loss of our economy, our wealth, our health, our happiness and ultimately. OUR

Philanthropy?
Beware Billionaires Bearing Gifts!

International media carried reports in 2010 of the Bill Gates-Warren Buffett philanthropic scheme called 'The Giving Pledge'. On 4 August the Giving Pledge revealed the names of 40 individuals and families who pledged to give away at least half of their fortunes during their lifetimes or at death. Buffett and Gates have thrown down the gauntlet to 70 to 80 of the Forbes 400. They plan to approach the remainder and to take this challenge beyond the US. They held a dinner in Beijing in October 2010 to persuade Chinese billionaires to participate in this venture.

News of the initial gathering of this group (curiously called 'The First Supper') appeared in a report by New York publisher, Niall O'Dowd, on 18 May 2009. Participants included the Davids Rockefeller Snr and Jr, George Soros, Ted Turner, Michael Bloomberg, Chuck Feeney and Oprah Winfrey. A media blackout ensured that two subsequent dinners were unreported and shy billionaires were able to speak openly about their fortunes and ideas for philanthropy. Fortune magazine published a Gates-Buffett informed article on 16 June 2010.

The Giving Pledge promises a massive increase in the money going to philanthropy. Forbes magazine estimated the 2009 net worth of the Forbes 400 at $1.2 trillion. Fifty percent of the net worth of those 400 would be $600 billion. That is the minimum amount Buffett and Gates are targeting.

Philanthropists who made the pledge posted a letter saying why they did it. The common denominator was a belief that the lives of the very rich can be empty if their wealth does nothing to advance the greater good.

Warren Buffett makes it clear that although the amounts being pledged are large, we are not talking about the widow's mite. In pledging to divest himself of 99% of his own fortune, Buffett says that he and his family will give up nothing they need or want. He says that his pledge will "leave my lifestyle untouched and that of my children as well."

The Giving Pledge has not been universally welcomed. US taxpayers have been compelled to commit much more than $600 billion to bailouts and stimulus plans to protect an economy which has caused them much hardship and which have not worked, but which have profited the billionaires. Many comments posted on Fortune's website are critical and angry. Some suggest that the billionaires were giving, fearing Obama would take wealth from them. One poster said that the billionaires' lifetimes of successful greed could not be offset by controlling who and what cause would get assistance. Suggestions were made that the philanthropic billionaires should act independently so that there would be diversity in the causes that would benefit.

There is considerable merit in this last suggestion. One very particular obsession of Messrs Gates, Buffett and Turner is population control. The Sunday Times reported on 24 May 2010 that the 'First Supper' was a secret meeting to consider how the billionaires' wealth could be used to "slow the growth of the world's population and speed up improvements in health and education." The paper reported that the philanthropists discussed joining forces to overcome political and religious obstacles to change. Taking their cue from Gates, the first supper decided to focus on overpopulation, and " a consensus emerged that they would back a strategy in which population growth would be tackled as a potentially disastrous environmental, social and industrial threat."

Bill and Melinda Gates have given millions of dollars to abortion providers like International Planned Parenthood (of which Gates has said his father is a former head). Bill Gates is on record as supporting population reduction programmes. The Gates Institute for Population and Reproductive Health provides abortion fellowships at Johns Hopkins University.In an extraordinary statement at the TED conference in February 2010, Gates suggests that vaccines have a role in population reduction. He is a huge supporter of vaccination programmes.

The Population and Family Health Sciences Department at Bloomberg School of Public Health in Baltimore MD also provides abortion fellowships.

Ted Turner is on the record calling for a worldwide one child policy similar to the one in China that practises forced abortion and coercive sterilization. Turner has given over $1 billion for UN programmes.

Warren Buffett has never spoken publicly about his views on abortion. The Wall Street Journal reported that in the 1990s, the Buffett Foundation helped to finance the research and development of the pills that induce abortion. His foundation also helped finance a lawsuit to overturn the ban on partial-birth abortion in Nebraska. The New York Times revealed in August 2010 that the Kenneth J. Ryan Residency Training Programme, which gives two or three years of seed money for abortion training for OB-GYN residents at medical schools on 58 campuses in the US and Canada, and the Family Planning Fellowship, are both entirely funded by Buffett's foundation. In 2006 Buffett gave the foundation about $3 billion. Tax returns indicate that total giving by the foundation increased from $202 million in 2007 to $347 million in 2008. In 2008 the foundation gave Planned Parenthood and its US affiliates about $45 million. Planned Parenthood International got approximately $8 million. The foundation paid out around $50 million to universities with either the Ryan or the Family Planning Fellowship. Tax records show that most of the spending goes on abortion and contraception matters. Buffett also gave in excess of $30 billion's worth of stock to the Bill and Melinda Gates Foundation in 2006.

The Financial Times has described Bill Gates' stated vision of the function of the billionaires as one of decision-making in a new constitutional order. Does wealth gives the unelected Gates and his associates the right to decide who may live or die and the size or complexion of any population?

Beware billionaires bearing gifts. They distort democracy.

The Guardian

Oliver Milman

AIDS Conference says 100 researchers may have been on flight MH17

The Guardian, 18 July 2014, 02.53 EDT
https://www.theguardian.com/world/2014/jul/18/aids-conference-says-100-researchers-may-have-been-on-board-crashed-plane

As many as 100 of the world's leading HIV/Aids researchers and advocates may have been on the Malaysia Airlines flight that crashed in Ukraine, in what has been described as a "devastating" blow to efforts to tackle the virus.

Delegates to a plenary session held ahead of the Aids 2014 conference were told that email exchanges showed about 100 attendees were booked on the MH17 flight. The plane was downed in eastern Ukraine by what the US and Australian governments have described as a surface-to-air missile.

There was no official confirmation of the number of researchers on board.

There were no survivors among the 298 people on the flight, which was bound for Kuala Lumpur from Amsterdam. The Aids 2014 conference, due to start on Sunday, is being held in Melbourne.

"There's a huge feeling of sadness here, people are in floods of tears in the corridors," Clive Aspin, a veteran HIV researcher who attended the pre-conference plenary session in Sydney, told Guardian Australia. "These people were the best and the brightest, the ones who had dedicated their whole careers to fighting this terrible virus. It's devastating."

Prof. Richard Boyd, director of the Monash Immunology and Stem Cell Laboratories, told Guardian Australia he was "gutted" by the losses.

"There were some serious HIV leaders on that plane," he said. "This will have ramifications globally because whenever you lose a leader in any field, it has an impact. That knowledge is irreplaceable.

"We've lost global leaders and also some bright young people who were coming through. It's a gut-wrenching loss. I was involved in the aftermath of 9/11 in New York and it brings back that level of catastrophe.

"But the Aids community is very close-knit, like a family. They will unite and this will galvanise people to strive harder to find a breakthrough. Let's hope that, out of this madness, there will be new hope for the world."

Trevor Stratton, an HIV/Aids consultant, told the ABC: "The cure for AIDS may have been on that plane, we just don't know. You can't just help but wonder about the kind of expertise on that plane."

A number of leading scientists, including a former president of the International AIDS Society (IAS) who has led HIV research efforts since 1983, are believed to be among the dead.

Organisers of Aids 2014, which is set to welcome about 14,000 delegates from around the world, said they were unable to officially confirm the number of people on MH17 who were due to attend the conference. The organisation said in a statement: “The IAS is hearing unconfirmed reports that some of our friends and colleagues were on board the flight and if that is the case this is truly a sad day.”

The president of the IAS, Françoise Barré-Sinoussi, told a prearranged event in Canberra that the deaths “will be a great loss to the HIV/Aids communities. If confirmed, it would be a terrible loss for all of us. I have no words really to try to express my sadness; I feel totally devastated if it is confirmed.”

IAS said the conference would go ahead as scheduled. Former US president Bill Clinton and activist Bob Geldof are due to speak.

The executive director of the Australian Federation of Aids Organisations, Rob Lake, said: "This morning's news is absolutely tragic and will be felt throughout the conference and worldwide.

“The people we have lost have played critical roles in the global fight against HIV.”

The Washington Post

Caelainn Hogan, Ariana Eunjung Cha

Top AIDS researcher and other scientists perished on MH17

The Washington Post, 18 July 2014
https://www.washingtonpost.com/national/health-science/top-aids-researcher-and-others-in-field-perished-on-mh17/2014/07/18/2aa31972-0e85-11e4-8341-b8072b1e7348_story.html

Members of the international HIV research community were in a state of shock after the death of world-renowned scientist Joep Lange and at least several other activists who perished when Malaysia Airlines Flight 17 was shot down Thursday over eastern Ukraine.

In an address to the nation Friday at noon, President Obama said "nearly 100" of those killed – *one third of the 298 people on board* – may have been en route to the 2014 International Aids Conference in Melbourne, which is scheduled to begin this weekend. The White House said the figure came from remarks made by Australian Prime Minister Tony Abbott.

But conference organizers said they have only been able to confirm seven names.

"We have been working hard to try and confirm how many people were on the flight. We've been speaking to a number of different authorities, and we think the actual number is much smaller," said Chris Beyrer, who will take over the presidency of the International AIDS Society at the end of the global conference next week.

Their efforts have been complicated by the fact that the airline has not released a passenger manifest so they have been relying on information from colleagues, friends, family members and authorities from various countries. He said that while there may be some people who were on the flight and headed to the conference that they do not know about, it appears that the numbers are "an order of magnitude smaller than what has been reported."

The Dark History of Vaccines, Natural Healing Clinic

13 March 2015

https://teachingyourselftoheal.wordpress.com/2015/03/13/the-dark-history-of-vaccines/

Stats Regarding Vaccines

A good place to start research is on the internet. Go to National Vaccine Center's website and start learning about various vaccines. Judicial Watch is another website. These are watchdogs to help keep us informed about truths being kept from us. There are many others.

Polio Vaccine

Attempts to make a polio vaccine in early 1900's failed. Finally Jonas Salk developed the "Salk" vaccine in 1952. To make the vaccine, the polio is injected into the kidney of a monkey, allowed to develop and then extracted and injected to humans as the vaccine. Two mistakes were made: First the vaccine was suppose to contain 'killed' virus, instead it contained the live virus. The vaccine reportedly gave polio to healthy people, many children died, it was pulled from the market. Secondly, despite government coverups, in 1960 a Dr. Ratner found the monkey virus (a cancer causing agent) in the 1955 Salk vaccine – Salk had used the Rhesus monkey as the host to incubate the virus and that particular monkey contained another virus – today we call it retrovirus.

The U.S. government was aware of the deadly vaccine, but they allowed it to remain on the shelves of pharmacies for another 1 1/2 years then quietly replaced the old stock with a newer version of the vaccine using the Green African monkey.

Between 1955-1963 as many as 98 million Americans received the contaminated SV-40 polio vaccines.

The World Health Organization (WHO) proclaimed that polio was eliminated from the Western Hemisphere in 1994 and the only cases of polio occurring in the US for the past 17 years have been caused by the vaccine itself.

The National Vaccine Information Center reports the vaccine kills as many as 900 children per year and leaves one of every 62,000 children with permanent brain damage. There is a reaction free vaccine produced in other countries, but it costs more and U.S. drug companies have lobbied to delay the use of the purified vaccine as long as possible.

That's not the end of the story. In the early 1990's, Michele Carbone, Asst. Prof. of Pathology, Loyola University, isolated fragments of SV-40 in human cancers. The viral contaminate from the 1950's appeared in up to 40% of bone cancers and 60% of mesotheliomas, a particularly nasty form of lung cancer usually caused by asbestos exposure.

Senior epidemiologist at the National Institute of Health, Dr. Howard Strickler, help confirm the link between cancers and the tainted vaccine. People who lived in Massachusetts and Illinois who received identified lot numbers of the contaminated vaccine administered in the 1950's are now demonstrating 10 times the rate of osteosarcoma bone tumors as those who received vaccine free of the SV-40 contaminate in other parts of the country. Italian researchers has found the monkey virus in between 14-83% of human brain tumors.

Studies looking for the virus in normal individuals (people free of disease at the time of testing) found SV-40 23% of blood samples and almost half of all sperm tested – the virus could be transmitted

sexually and through blood transfusions. Being a blood borne organism, it is alsosuspected that it passes from mother to fetus.

This led to discover of the worst news of all: SV40 has appeared in 61% of all new cancer patients. Patients too young to have received the contaminated vaccine administered 40 years ago.

DPT Vaccine (Diphtheria, Pertussis (whooping cough) and Tetanus).

Vaccine consists usually of 5 doses between 2 months old – 15 years old. Side effects include seizures, serious allergic reactions, decrease in consciousness, permanent brain disease, death. Journal Pediatrics in 2009 concluded the largest risk among unvaccinated children is the disease the vaccination is designed to protect against.

In 1986 The major vaccine manufactures lobbied Congress to pass the National Childhood

Vaccine Injury Act (NCVIA) to absolve them of all liability related to adverse reactions caused by their products. With this Act, the National Vaccine Injury Fund was established by levying a user fee against citizens for immunizing their children. Since its creation the fund has compensated 579 vaccine induced deaths adjudicated through the Federal Court of Claims to the tune of $700 million dollars . 40% (227) of these vaccine induced deaths were originally misdiagnosed as sudden infant death syndrome (SIDS). The American taxpayer compensated the victims of these defective products, the major manufacturer and supplier of DPT in the U.S. (Wyeth-Lederle), watched its profits soar 300% since the passage of this Act. Wyeth-Lederle earned $350 million in sales of DPT last year.

There is a great difference between filing a malpractice case and having damages awarded to the victims of medical malpractice. All told, the dollar amount associated with litigation for negligent practice totals up to only 1% ($10 billion dollars) of the total annual health care tab. This is for all malpractice litigation and vaccine litigation is but a small portion of this amount.

A Harvard Medical Practice Study revealed that of the 1% of patients estimated to be injured as a result of negligence, and only 1/8 ever discovered they were victimized and filed suit, and only1/16 of those filing suits ever recovered any monetary damages.

MMR Vaccine (Measles, Mumps and Rubella)

For years people have been complaining about the finally admitted to now causing autism in children, permanent brain damage and death. In the year 2009 a court case finally got them to admit the truth. http://www.whale.to/vaccine/mmr2.html is a site you can visit, but there are many.

PNEUMOVAX admits to 1295 hospitalizations and 40 deaths. Pneumovax is produced by Merck & Co. They were all females. See http://www.whale.to/vaccines/pneumovax1.html.

Smallpox Vaccine

Many feel smallpox vaccine did not save lives, it spread it around the world with other infections such as leprosy. Whether that is true or not, In 1880 the smallpox vaccine was killing 25,000 babies in england/Wales. In 1921 the number was down to 6,000 deathsfrom the vaccine. It is thought that smallpox vaccine wiped out smallpox from the planet, but many statistics show it was leaving of its own natural cycle. Prior to U.S. taking over the Philippines, the mortality rate from smallpox was 10%, after commencement of vaccinations, an epidemic occurred and the mortality rate went up as high as 50% in different parts of the islands.

In 1918-19 with over 95% of its population vaccinated, the worst epidemic occurred, resulting in a case mortality of 65% with the highest percentage occuring where the most thorough vaccinations took place and vice-versa.

In 1918 the US Army forced vaccinations of 3,285,376 natives in the Philippines when no epidemic was brewing. Of those vaccinated, 47,369 came down with smallpox and of these 16,477 died – and the next year they doubled the experiment, vaccinating 7,670,252 natives – 65,180 victims came down with small-pox and 44,408 died. So in the first experiment 1/3 died, in the second 2/3 died.

Erysipelas – acute strep bacterial infection.
During the 22 years from 1859 to 1880 (22 years), 390 people died from the vaccine, increasing nearly 8 fold in 30 years.

VAERS – Yellow Fever Vaccine.
From 1996-2006 they are admitting to 21 deaths.
Those people are listed http://www.whale.to/vaccie/vaers_yf.html.

Gardasil- Cervarix:
29 deaths in 2 years, 5,000 visits to E.R., causing seizures, strokes, heart problems. More than 1,300 girls in the United Kingdom have experienced negative reactions to the government-mandated Cervarix vaccine for the human papillomavirus (HPV), according to adverse events reports collected from doctors by the Medicines and Healthcare products Regulatory Agency (MHRA).

Cervarix, manufactured by GlaxoSmithKline, inoculates patients against strains 16 and 18 of HPV, which are believed to be responsible for 70 percent of cervical cancer cases. The British government began a program to vaccinate all secondary school girls in September 2008, and 700,000 have received the injections so far. The government's plan is to have all girls under the age of 18 vaccinated by 2011.

Critics have objected that the government based its decision on studies of women under the age of 26, rather than studies conducted on school-age girls. In addition, while the vaccine has been shown to prevent against HPV infection in the short term, there is no evidence of its long-term efficacy or that it actually lowers cancer rates.

The MHRA reports show a total of 2,891 adverse events reported in 1,340 girls. The majority were minor and short-lived problems, such as swelling, rashes, pain or mild allergies to the vaccine. A number of cases were more severe, however, including 20 cases of blurred vision, four cases of convulsions, one case of seizures and one epileptic fit. Five cases of partial paralysis were reported, including Bell's palsy (face), Guillain-Barre syndrome (legs), hyopaesthesia (loss of sense of touch) and hemiparesis (severe weakening or paralysis of half the body).

On June 8, 2006, the Food and Drug Administration (FDA) approved the drug Gardasil. Gardasil is a vaccine against certain types of human papillomavirus (HPV) which is the primary cause of cervical cancer in women. Several state and local governments have proposed requiring the vaccine for school girls entering the 6th grade.

Gardasil is approved for girls as young as nine years old, despite the fact that the youngest girls participating in clinical trials were 11-12 years old. A recent study, published in the New England Journal of Medicine, also questioned the general effectiveness of Gardasil. Additionally, there has not been a chance to study long term side effects of the vaccine.

A Judicial Watch Special Report gives an analysis of records obtained from the Food and Drug Administration (FDA) concerning a recent vaccine called Gardasil. Gardasil helps protect against four types of human papillomavirus (HPV). The vaccine was approved in May 2006 and was created and marketed by Merck & Company Inc.

The records include Merck's patent and drug information submitted to the FDA, transcripts and briefing material from approval meetings, and reports documenting health, safety, and efficacy test results, as well as Vaccine Adverse Event Reporting System (VAERS) documents detailing 8,864 cases of adverse effects experienced by people after receiving the Gardasil vaccine. VAERS reports show that at least eighteen people have died after receiving Gardasil.1 Many health officials believe that adverse reactions to medications are widely under-reported, therefore the actual number of adverse events occurring after vaccination with Gardasil is likely to be higher.

Judicial Watch uncovered thousands of pages of material pertaining to Gardasil, which is designed to prevent cervical cancer. The controversial vaccine was fast-tracked for approval by the FDA despite

concerns about Gardasil's safety and long-term effects. The vaccine is still in the testing stages (final report due September 30, 2009), but it is already being administered to thousands of young girls and Merck has waged an aggressive lobbying campaign with state governments to mandate this HPV vaccine for young girls.

Gardasil was recommended for pregnant women also but was immediately halted when women started losing their babies, having miscarriages and babies were born malformed.

SARS (Severe Acute Respiratory Syndrome) 2003.

Wikepedia reports Conavirus is the basis of this disease. 8,096 known infected cases and 774 deaths (rate of 9.6%) reported worldwide. It started in Guangdong province of China, rapidly infecting individuals in 37 countries around the world. Mortality rate is usually about .6% primarily amongst the elderly but can rise as high as 33%. Viral pneumonia mortality rate is about 70%.

The Sars vaccine developed in China's laboratories was never used. by the time it was discovered, the outbreak had subsided.

Chickenpox Vaccine – 2006.

The vaccine didn't work and was reported unsuccessful. Health experts reported the vaccine was 85-97% effective. Children still got chicken pox after mass immunization at schools. Mandatory vaccines at schools are still being demanded.

MMR (Measles, Mumps, Rhubella) Vaccine –

At a time when health officials are quietly admitting that there could be a link between the MMR (measles-mumps-rubella) vaccine and autism, a new study has also discovered that the vaccine doesn't work. Researchers investigating a large outbreak of mumps in 2006, when 6,584 cases were reported among college students, have discovered that virtually every sufferer had been vaccinated twice against the disease. The Centers for Disease Control (CDC) reveals that at least 84 per cent of young adults aged between 18 and 24 years had received two-dose vaccines against mumps. And in 2006 – when the outbreak occurred – the national two-dose coverage among adolescents reached 87 per cent, the highest in US history, and just one point below that needed for 'herd immunity'

Incidents of meningitis linked to the measles, mumps, rubella (MMR) vaccine in Japan are far higher than first thought, affecting around one in 1044 vaccinations. The Japanese Ministry of Health withdrew the vaccine in April 1993.

A recent study published in PloS titled "Difficulties in eliminating measles and controlling rheubella and mumps: a cross-sectional study of a first measles and rubella vaccination and a second measles, mumps and rubella vaccination" has brought to light the glaring ineffectiveness of two measles vaccines (measles-rubella (MR) or measles-mumps-rubella (MMR) in fulfilling their widely claimed promise of preventing outbreaks in highly vaccine compliant populations. In China 99% are vaccinated but still continues to have measles outbreaks (Sayer Ji, Why is China Having Measles Outbreaks When 99% are Vaccinated? GreenMedInfo 10 September 2014)

Swine Flu 1996

There were 500 cases of Gullian-Barre paralysis, including 25 deaths – not due to the swine flu itself, but as a direct result of the vaccine. At the time President Gerald Ford, on advice from the CDC, called for vaccination of the entire population of the United States.

CBS " 60 MINUTES" did a documentary on the swine flu epidemic of 1976 in the U.S. It went on air only once and was never shown again. Watch this video documentary on You Tube and listen to testimony of people who caught Gullian-Barre paralysis because of the swine flu vaccine. They sued the US government for damages.

Finally in 2009 it was announced that more people died of the Swine Flu vaccine than died of the actual flu. There were 500 cases of Gullian-Barre paralysis, including 25 deaths – not due to the swine

flu itself, but as a direct result of the vaccine. At the time President Gerald Ford, on advice from the CDC, called for vaccination of the entire population of the United States.

2006 Scandal. The Baxter company has been associated with two deadly scandals. The first event occurred in 2006 when hemophiliac components were contaminated with HIV virus and injected in tens of thousands of people, including thousands of children. Baxter continued to release the HIV contaminated vaccine even after the contamination was known.

World Health Organization maintains an agreement with Baxter Pharmaceuticals to produce the world's pandemic vaccine. Novartis, the second contender, also has an agreement with WHO for a pandemic vaccine. Novartis appears to have won the contract, since their vaccine is near completion.

Dr. Russel Blaylock, a renounced neurosurgeon is terrifed because these pandemic vaccines contain ingredients, called immune adjuvants that a number of studies have shown cause devastating autoimmune disorders, including rheumatoid arthritis, multiple sclerosis and lupus.

Animal studies using this adjuvant have found them to be deadly. A study using 14 guinea pigs found that when they were injected with the special adjuvant, only one animal survived. A repeat of the study found the same deadly outcome.

What is this deadly ingredient? It is called squalene, a type of oil. The Chiron company, maker of the deadly anthrax vaccine, makes an adjuvant called MF-59 which contains two main ingredients of concern—squalene and gp120. A number of studies have shown that squalene can trigger all of the above-mentioned autoimmune diseases when injected.

The MF-59 adjuvant has been used in several vaccines. These vaccines, including tetanus andvdiphtheria, are the same vaccines frequently associated with adverse reactions.

Dr. Blaylock reviewed a number of studies on this adjuvant and found something quite interesting.
Several studies done on human test subjects found MF-59 to be a very safe immune adjuvant. But when he checked to see who did these studies, he found that they were done by the Novartis
Pharmaceutical Company and Chiron Pharmaceutical Company, which have merged. They were all published in "prestigious" medical journals. Also, a great number of studies done by independent laboratories and research institutions all found a strong link between MF-59 and autoimmune diseases.

Squalene in vaccines has been strongly linked to the Gulf War Syndrome. On August 1991, Anthony Principi, Secretary of Veterans Affairs admitted that soldiers vaccinated with the anthrax vaccine from 1990 to 1991 had an increased risk of 200 percent in developing the deadly disease amyotrophic lateral sclerosis (ALS), also called Lou Gehrig's disease. The soldiers also suffered from a number of debilitating and life-shortening diseases, such as polyarteritis nodosa, multiple sclerosis (MS), lupus, transverse myelitis (a neurological disorder caused by inflammation of the spinal cord), endocarditis (inflammation of the heart's inner lining), optic neuritis with blindness and glomerulo-nephritis (a type of kidney disease).

Because squalene, the main ingredient in MF-59, can induce hyperimmune responses and induce autoimmunity, a real danger exists for prolonged activation of the brain's immune cells, the microglia. This type of prolonged activation has been strongly associated with such diseases as multiple sclerosis, Alzheimer's disease, Parkinson's disease, ALS and possibly vaccine-related encephalitis. It has been shown that activation of the systemic immune system, as occurs with vaccination, rapidly activates the brain's microglia at the same time, and this brain inflammation can persist for long periods.

How does gp120 get into the brain? Studies of other immune adjuvants using careful tracer techniques have shown that they routinely enter the brain following vaccination. What most people do not know, even the doctors who recommend the vaccines, is that most such studies by pharmaceutical companies observe the patients for only one to two weeks following vaccination – these types of reactions may take months or even years to manifest.

It is obvious that the vaccine manufacturers stand to make billions of dollars in profits from this WHO/government-promoted pandemic. Novartis, the maker of the new pandemic vaccine, recently announced that they would not give free vaccines to impoverished nations – everybody pays.

One must keep in mind that once the vaccine is injected, there is little you can do to protect yourself – at least by conventional medicine. It will mean a lifetime of crippling illness and early death.

Avian Flu Vaccine

Toronto Sun reported not long ago (2009) that Baxter International r*eleased seasonal flu virus material from a plant in Austria containing live H5N1 Avian Flu Virus*. It was sent to sub-contractors in the Czech Republic, Slovenia and Germany.

The contamination incident, which is being investigated by four European countries, came to light when the subcontractor in the Czech Republic inoculated ferrets with the product and they died.

Ferrets shouldn't die from exposure to human H3N2 flu viruses.

Accidental release of a mixture of live avian H5N1 and human H3N2 viruses could have resulted in dire consequences. H5N1 doesn't easily infect people, H3N2 viruses does. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people. That mixing process, called reassortment, is one of two ways pandemic viruses are created.

Mike Adams, the Health Ranger, Natural News Editor writes in Vaccines as Biological Weapons? Live Avian Flu Virus Placed in Baxter Vaccine Materials Sent to 18 Countries:

Deerfield, Illinois-based pharmaceutical company Baxter International Inc. has just been caught shipping live avian flu viruses mixed with vaccine material to medical distributors in 18 countries.

The 'mistake' was discovered by the National Microbiology Laboratory in Canada. The World Health Organization was alerted and panic spread throughout the vaccine community as health experts asked the obvious question: How could this have happened?

Or put another way, Baxter is acting a whole lot like a biological terrorism organization these days, sending deadly viral samples around the world. If you mail an envelope full of anthrax to your Senator, you get arrested as a terrorist. So why is Baxter – which mailed samples of a far more deadly viral strain to labs around the world – getting away with saying, essentially, "Oops?"

But there's a bigger question in all this: How could this company have accidentally mixed LIVE avian flu viruses (both H5N1 and H3N2, the human form) in this vaccine material?

Was the viral contamination intentional?

The shocking answer is that this couldn't have been an accident because Baxter International adheres to something called BSLE (Biosafety Level 3) – a set of laboratory safety protocols that prevent the cross-contamination fo materials.

Laboratory personnel have specific training in handling pathogenic and potentially lethal agents and are supervised by competent scientists who are experienced in working with these agents.

This is considered a neutral or warm zone. All procedures involving the manipulation of infectious materials are conducted within biological safety cabinets or other physical containment devices, or by personnel wearing appropriate personal protective clothing and equipment. The laboratory has special engineering and design features.

It is bad enough that governments all over the world have been warning about the likely pandemic flu. Now we find out we cannot trust Big Pharma to handle such bio-hazardous material in a safe manner.

Who knows whether it was intentional? But I sure would like to know what really happened? And I sure would like to see the people responsible fired!

Paul J. Watson adds in "Accidental' Contamination of Vaccine with Live Avian Flu Virus Virtually Impossible: Czech newspapers are questioning if the shocking discovery of vaccines contaminated with the deadly avian flu virus which were distributed to 18 countries by the American company Baxter were part of a conspiracy to provoke a pandemic.

The claim holds weight because, according to the very laboratory protocols that are routine for vaccine makers, mixing a live virus biological weapon with vaccine material by accident is virtually impossible.

"The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses," reports the Canadian Press.

Baxter flu vaccines contaminated with H5N1 – otherwise known as the human form of avian flu, one of the most deadly biological weapons on earth with a 60% kill rate – were received by labs in the Czech Republic, Germany, and Slovenia.

Initially, Baxter attempted to stonewall questions by invoking "trade secrets" and refused to reveal how the vaccines were contaminated with H5N1. After increased pressure they then claimed that pure H5N1 batches were sent by accident. This was seemingly an attempt to quickly change the story and hide the fact that the accidental contamination of a vaccine with a deadly biological agent like avian flu is virtually impossible and the only way it could have happened was by wilful gross criminal negligence.

According to a compiled translation from Czech newspaper stories, the media over there is asking tough questions about whether the contamination was part of a deliberate attempt to start a pandemic.

"Was this just a criminal negligence or it was an attempt to provoke pandemia using vaccination against flu to spread the disease – as happened with the anti-B hepatitis vaccination with vaccines containing the HIV virus in US? – and then cash for the vaccines against H5N1 which Baxter develops? How could on Earth a virus as H5N1 come to the ordinary flu vaccines? Don't they follow even basic precautions in the American pharma companies?" states the translation.

The fact that Baxter mixed the deadly H5N1 virus with a mix of H3N2 seasonal flu viruses is the smoking gun. The H5N1 virus on its own has killed hundreds of people, but it is less airborne and more restricted in the ease with which it can spread. However, when combined with seasonal flu viruses, which as everyone knows are super-airborne and easily spread, the effect is a potent, super-airbone, super deadly biological weapon.

Spreading bird flu would create an instantaneous surge of demand for bird flu vaccines. The profits that vaccine companies such as Baxter International could reap out of such a panic are astronomical.

In addition, as we have previously reported, those that have a stake in the Tamiflu vaccine include top globalists and BIlderberg members like George Shultz, Lodewijk J.R. de Vink and former Secretary of Defense Donald Rumsfeld.

Authorities in both Europe and the U.S. have openly detailed plans for martial law, quarantine and internment should a bird flu pandemic occur.

The other motivation, as we have exhaustively documented on this website for years, is the fact that elites throughout history have openly stated that they want to see a world population reduction of around 80 per cent. Shocking stories like this take the plausibility of that narrative out of the realms of conspiracy theory and into the dangerous reality of conspiracy fact.

This is not the first time that vaccine companies have been caught distributing vaccines contaminated with deadly viruses. In 2006 it was revealed that Bayer Corporation had discovered that their injection drug, which was used by hemophiliacs, was contaminated with the HIV virus.

Internal documents prove that after they positively knew that the drug was contaminated, they took it off the U.S. market only to dump it on the European, Asian and latin American markets, knowingly

exposing thousands, most of them children, to the live HIV virus. Government officials in France went to prison for allowing the drug to be distributed. The documents show that the FDA colluded with Bayer to cover-up the scandal and allowed the deadly drug to be distributed globally. No Bayer executives ever faced arrest or prosecution in the United States.

Tamiflu.

President Bush sought to instill panic in this country by telling us a minimum of 200,000 people will die from the avian flu pandemic, but it could be as bad as 2 million deaths in this country alone," writes Joseph Mercola. "This hoax is then used to justify the immediate purchase of 80 million doses of Tamiflu, a worthless drug that in no way shape or form treats the avian flu, but only decreas es the amount of days one is sick and can actually contribute to the virus having more lethal mutations."

In response to this hype – or rather, the reason for the hype – the United States placed an order for 20 million doses of this worthless drug at a price of $100 per dose. It cost the taxpayers around $2 billion.

Seasonal Flu Vaccine

Many people have one flu shot and swear they will never have another after feeling even worse that when they get the flu. Common reactions are pain, soreness, swelling where the short was administered, and systemically fever, malaise, aching muscles. If allergic to eggs, there can be hives and anaphylaxis. Flu shots contain several strains of virus, as well as heavy metals such as aluminum, and mercury, and formaldehyde. Reactions only last a few days (about the same as if you had the flu)

In 1996 it was reported the flu shot raises the risk of Guillain-Barre (CTV News), which causes paralysis and death, affects one in a million – not good if you are that one.

2006 Israel Health Minister removed flu vaccines from the market after 3 people die within 3 days of receiving the vaccine.

2008: reported unsuccessful and stopped. Dr. Russell Blaylock, neurosurgeon: It is helpful to recall that the Centers for Disease Control with the collusion of the media, constantly tell us that 36,000 people die from the flu each year, a figure that has been shown to be a lie. In this case, we are talking about 300 plus deaths for the entire world. Aluminum is used in the seasonal flu vaccine that also is toxic to the brain, causing long term damage.

Swine Flu Vaccine aka N1H1 2009:

Doctor in Calgary says he's not getting flu shots as he was informed only 115 people were tested in the preliminary testing. Lots of misinformation: preliminary research suggests seasonal flu shot may increase your probability of getting swine flu.

Media is told that many are dying from swine flu in 2009, when in fact very very few have died, and the ones the are using as stats have died of pneumonia and complications to alreadydiseased respiratory conditions.

Side effects to swine flu vaccine (admitted) are mild fever, aching muscles, nausea, headache, fainting, soreness/redness/swelling at injection site, runny nose or congestion if using nasal spray vaccine.

In Denmark after death in an individual occurred, the vaccine was stopped. Retired Minister of Health suggests it is an act of terrorism to deplete the numbers of people on the planet.

Pregnancy

Dr. Russell Blaylock, retired neurosurgeon is researching and revealing information regarding the vaccines. He predicts long term problems and warns about pregnant women getting vaccines which can cause brain damage to the fetus. He says the mercury used in the vaccine also is the type that damages brain. He reminds mothers that when the baby is getting its vaccines is just the time when the brain is developing rapidly. Highest admission to hospital is from birth to 2 years old which is when children get their MMR shots etc.

Studies reveal that the virus doesn't get through the placenta to infect the baby but it is the immune reaction in the mother and these immune cytokines pass through the placenta causing the baby's brain to develop abnormally (eg. autism). So any immune stimulation of the mother can produce abnormalities of the baby with no vrus whatsoever – you can just stimulate the immune system and get the reaction – which is what a viral reaction does, and it is what the vaccines do.

Certainly the Government wouldn't do anything to Hurt US!

Watch the documentary "Deadly Deception" by Nova on educational channel. You will learn that in Alabama for 40 years between 1932 and 1972 a *deadly experiment took place* where government doctors promised black men free treatment for 'bad blood' or syphillis (Tuskegee study).

In fact what almost 400 black men were getting was actually syphillis. When they began showing symptoms all doctors to told to refuse any treatment for them so they could be studied to see how they reacted. They had no idea of what was being done to them, most died terrible deaths. For years it was denied, finally an apology was issued May 16, 1997.

In the 1960's at the Kingston Prison for women, experiments were conducted on 23 inmates using LSD. The prison's superintendent and federal corrections officials had full knowledge of the experiment. Very few atrocities are revealed when it comes to coverups by professionals.

In the National News, March 31 2005: Institutional detainees subjected to vaccine trials in the 1950s and 60s have been ignored by the Government's compensation commission and now a lobby group has threatened to take the issue to the European Court of Human Rights.

Last night, the Irish Survivors of Institutional Abuse International (ISIAI) confirmed that they've been informed the Ryan Commission – which continued the work of the Laffoy Commission – is unlikely to be able to process complaints from institutional detainees who were subjected to vaccine trials without permission.

The commission – which is already struggling to cope with the volume of claims to be processed – believes that it does not have the technical or research facilities to properly examine the vaccine issue.

However, the ISIAI argued that the vaccine trials for pharmaceutical companies were amongst the most upsetting and exploitative of the abuses suffered by those in state and Church institutions. ISIAI chairman Tom Cronin said: "It is almost as if this issue is too damaging for anyone to deal with".

BEFORE IT'S NEWS

Secret Society Kills TI Doctor (Videos)

Before It's News, 1 April 2015, 14:48
https://beforeitsnews.com/alternative/2015/04/secret-society-hacks-to-death-targeted-individual-doctor-3131626.html

Targeted Individuals typically experience computer hacking. Emails never arrive, passwords are stolen and emails are sent to appear coming from them. These are prime ways that the secret world government, that President J. F. Kennedy both warned about and vowed to end, uses to ruing the lives of innocent people of integrity, such as the very attractive, compassionate, well-loved doctor who had communicated with Deborah Dupré and was eventually secretly persecuted to death.

"I am pretty sick now and constantly assaulted so not much chance for recovery anymore. I wrote you a long email and then it disappeared so I just sent a short reply the other night," the doctor had written to her friend, asking him to contact Dupré for help.

"I am in an unfamiliar email on an unfamiliar computer…" she'd expalined.

By first isolating the target from friends', family members' and online support, the secret society can apply more lethal tactics with impunity.

Beware of Covert Attacks

A web of inter-connected cults under the umbrella commonly called "intelligence service," is working in communities around the globe, day and night, to covertly ruin lives of thousands if not millions of innocent, law-abiding people, each of whom knows first hand secret "service" terror. Think you're immune? One major commonality among all people being covertly persecuted, communicating with Deborah Dupré about hell on Earth they endure as Targeted Individuals, is their integrity, obviously a thorn in the side of today's ruling cabal.

A tragic example of TIs' persecution is described in the following email by the friend of the covertly persecuted doctor. The friend is remaining anonymous, according to family wishes. The TI had explained thatt her emails being hacked were among other biological and technological assaults she experienced, as well as what she called "gangstalking." Her friend wrote to me:

"I have a close friend who claims to have been, and still is a victim of "gang stalking". The reason that I am writing to you is because of your article "Collateral Damage USA" My friend claims to be a victim of covert surveillance and DEWs, which has been going on for several years. Her life has turned completely upside down. The stalking has been systematically orchestrated in an attempt to rob her of family, friends, reputation, home and economic stability and even her physical health.

She has gone to the local police and the FBI, but both claim they are unable to help due to lack of evidence and I believe she is not being taken seriously. Since she has been unable to receive any help in this situation, it was my idea to bring this out in the open, to bring awareness to the subject and hopefully help her and perhaps others in a similar plight. And in all honesty, she simply doesn't know what else to do or where to go to get help and / or put her life back on track.

President Kennedy, one of the highest profile Targeted Individuals (TIs) in modern history, knew and spoke about the "intelligence service," a "secret society" serving the New World Order elite. In describing its secretive satanic activities, Kennedy stated that the very word "secrecy" is "repugnant in a free and open society." He said much more in attempt to educate the public about the secret society working in direct opposition to human rights, to kill one way or another most humans and to control survivors.

"We decided long ago, that the dangers of excessive and unwarranted concealment of pertinent facts far outweigh the dangers which are cited to justify it,"

Kennedy referred to the secret cabal as a "monolithic and ruthless conspiracy" that "relies on primarily covert means," and is "opposing" America's high ideals, such as freedom, integrity and compassion – ideals most Targeted Individuals exhibit, according to their communications with Dupré and her research.

Leading EU Targeted Individual Magnus Olson recently reported to Deborah Dupré in a telephone conversation that he refers to TIs as "online targets," due to the high impact of the intelligence service's technologically generated assaults on innocent targets.

No doubt, "surveillance technology" is in hands of secret society terrorists. There also is no doubt that they are targeting innocent people, as Leonid Bershidsky told *Bloomberg* in 2013, and as Australian surveillance issues expert Paul Baird, had reported years before that.

To frame the target for criminal activity or at least, make the target appear to be an undesirable or mentally unstable, the intelligence service is hacking emails of not only "activists" and whistle-blowers, as the popular Washington's Blog reports. It's been doing the same in a myriad of ways to innocent targeted individuals for years.

Now add to that list the endless possibilities since car computers can be hacked. It is believed that's how Michael Hastings met is early death.

Is Big Brother targeting you through your emails?

"You send an email to a reporter saying that you've got proof of criminal wrongdoing by a government official … or a big bank. You never receive a response," reports Washington's Blog. "Or you send an email to an expert on monetary policy asking if the Federal Reserve's policies help the rich at the expense of the little guy … or an expert on radiation asking if the Fukushima accident might endanger public health. You never receive a response."

Washington Blog says there might be another reason for no response: Your email ended up in their spam folder; They're busy; They're not interested enough to reply, They think you're a bore or a crank.There could be, however, "another explanation," one known all too well by targeted individuals.

China has blocked Gmail for its citizens. Yahoo has blocked emails relating to Occupy protests. Bahrain has been using British software allowing government to frame political activists by *creating* messages from that person that they never typed. 35 other countries use the same software. Not only activists, but innocent targeted individuals from around the globe are reporting these problems.

Tunisia monitored and blocked the emails of activists, so they were never delivered. For example:

There is also technical surveillance whereby downloading or adding attachment to an email must go through a central server. Under the pretext of protecting public order and national security, a 1998 post and telecommunications law enables the authorities to intercept and check the content of email messages and in fact electronic surveillance such as filtering of email messages of government opponents have been reported. Global Voices Advocacy Director and Tunisia Activist Sami Ben Gharbia conducted a test from the Netherlands with two Tunisia-based activists and confirmed by logging to their email accounts from the Netherland that what he sees is not what they receive when they login from Tunisia, and that they cannot access some of the messages they receive.

The Tunisian government used software from Western companies to block emails of political dissidents.

"A prominent American political writer said that – if Tunisia is doing it – you can bet that Western countries are, as well," Washington's Blog reports. Long after innocent targeted individuals were reporting these issues and receiving no aid from human or civil rights organizations, Snowden revealed that the British spy agency GCHQ has developed numerous offensive digital tools, including:

Ability to deny functionality to send/receive email or view material online.
***
Ability to spoof any email address and send email under that identity.
***
Mass delivery of email messaging to support an Information Operations campaign.

"The potential for stifling dissent is staggering," Washington's Blog reports. The number of activists impacted pales in comparison to the number of Targeted Individuals. Activists only comprise one of many cohorts identified as typical targets.

The potential for ruining the lives of any ordinary guy or gal and their families through email hacking is staggering. At the very least, it keeps targets isolated from friends and family members who might offer support. It is also a time waster for the target, who continually has to contact servers to complain and to create new passwords.

Imagine being behind your desk at work, finally completing the master document you'd been working on for six months and you click "send" to email it to your boss, only to find the email was never sent. You not only missed the deadline, but your work was altered so it is filled with errors – unbeknown to you until the boss fires you for such sloppy work.

Exposing hacking provides another glimpse into the human rights to privacy being abused to help ruin the lives of tens of thousands of innocent targeted individuals. It is only, however, one of many ways Targeted Individuals are being persecuted to death, while the public misunderstands or chooses to look the other way.

https://web.archive.org/web/20150421222624/https://www.youtube.com/embed/IxNw8OhmVZE

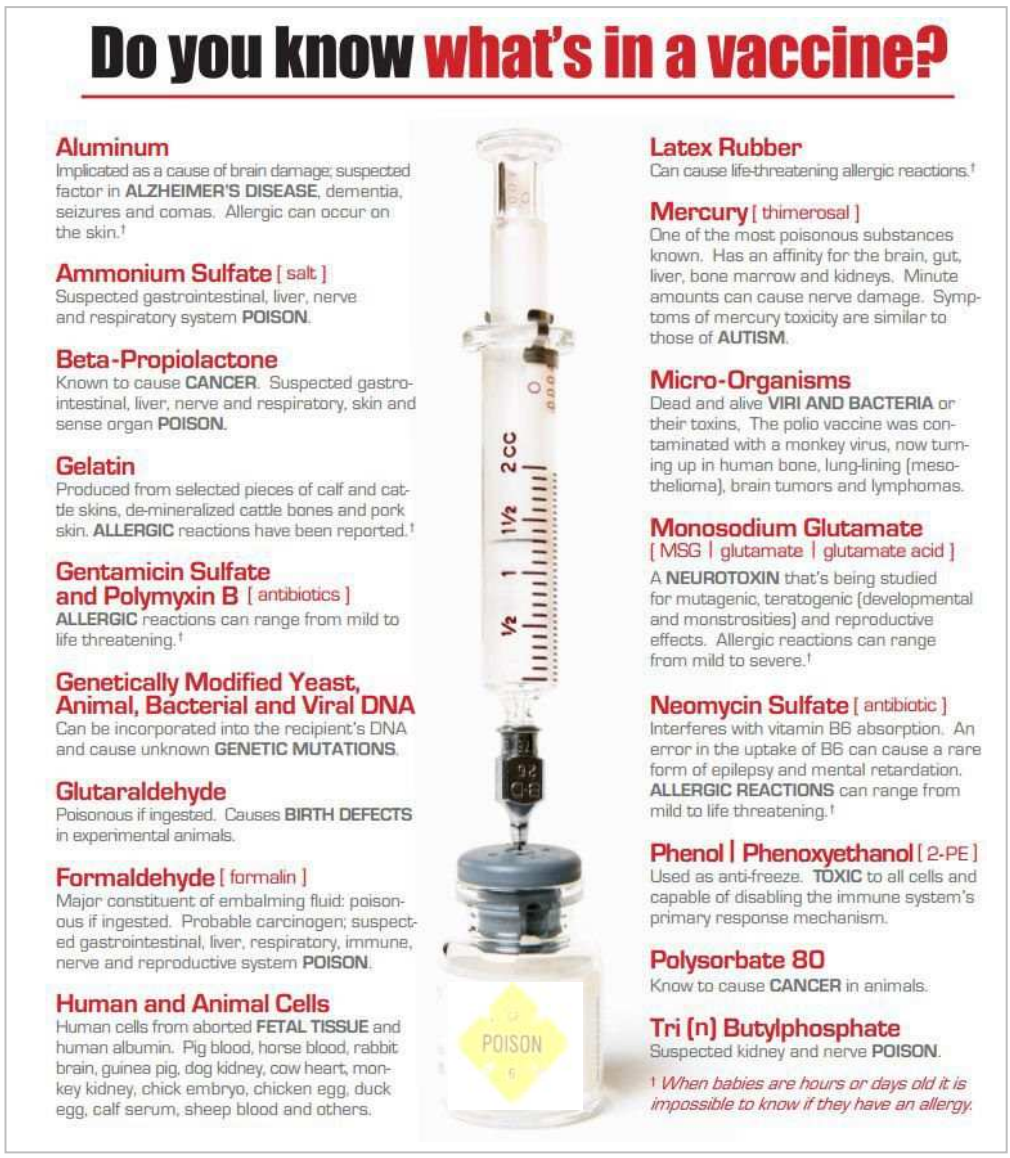
The TI doctor, who'd written to Dupré for help, whose friend had also written to this author, asking for the same and to expose the hellish assaults on his lovely friend, died in October. She was not considered to be an activist. She was a highly intelligent and beautiful soul, with a lovely spirit, adored by all who met her, according to published accounts and her communications. Her name was Dr. Deborah Gilmaker. RIP.

Joe Dubs

Health & Healing Vaccines: Did They Really Save Us From Dis-ease?

Health & Healing, 15 June 2015
https://joedubs.com/vaccines-they-didnt-really-save-us-from-disease/

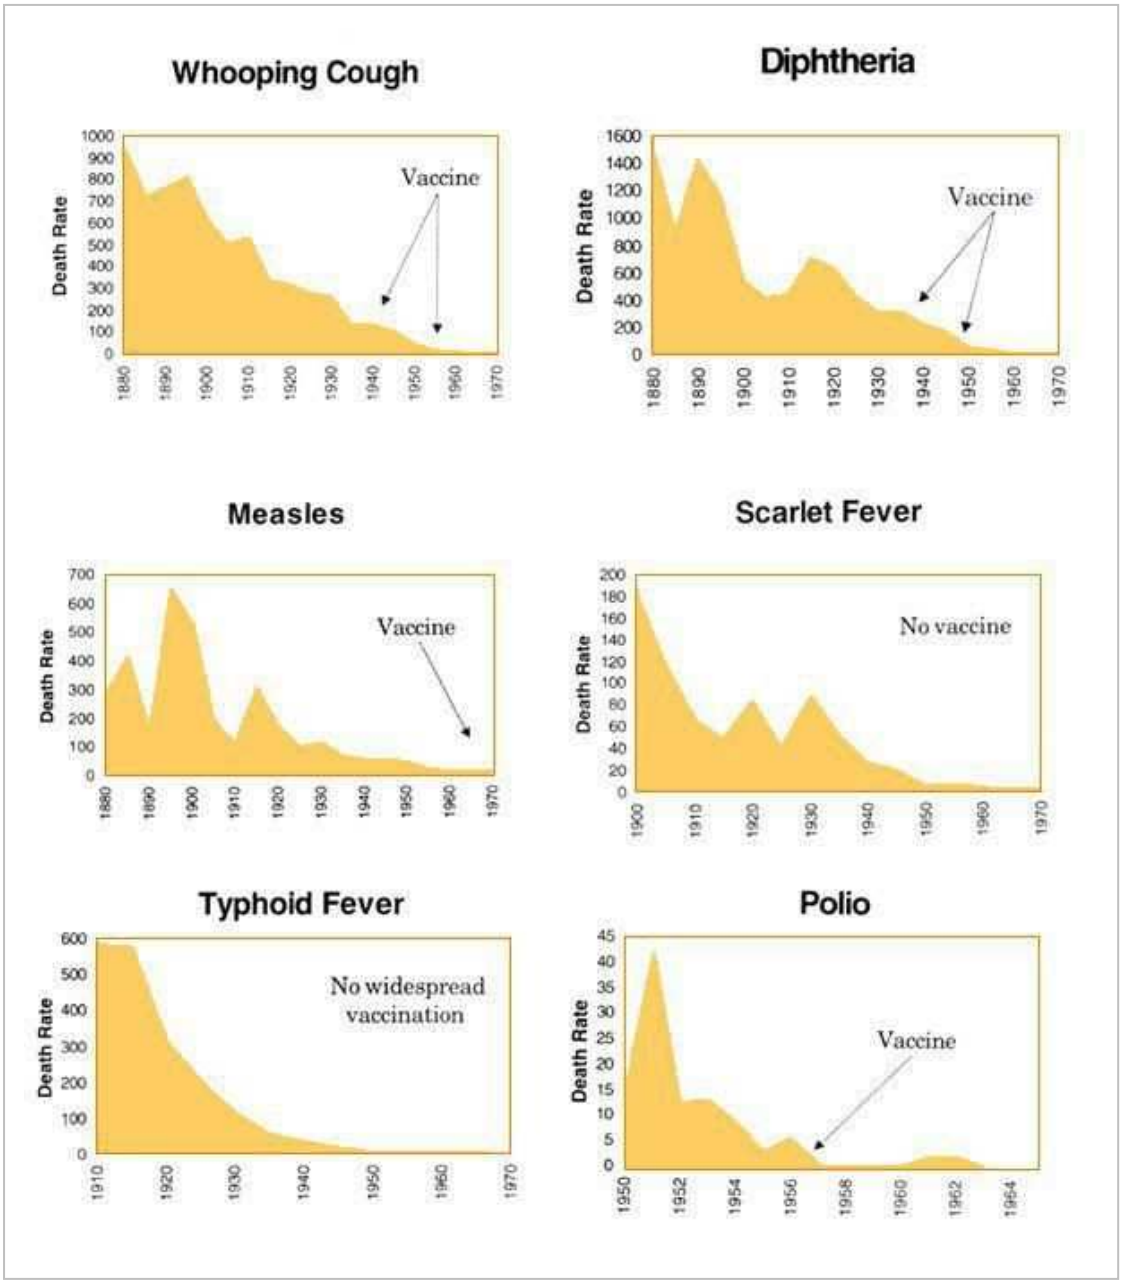
Most people believe that vaccines saved us from deadly diseases. We actually don't have any scientific evidence to prove this, but nevertheless we still believe this is the case. It *would be unethical to conduct a double-blind, placebo controlled study to prove the efficacy of vaccines* since we already ostensibly know they work and wouldn't want to put innocent children (the control group) at risk of disease.



Do you know what's in a vaccine?
Aluminum
Implicated as a cause of brain damage; suspected factor in ALZHEIMER'S DISEASE, dementia, seizures and comas. Allergic can occur on the skin.†
Ammonium Sulfate [salt]
Suspected gastrointestinal, liver, nerve and respiratory system POISON.
Beta-Propiolactone
Known to cause CANCER. Suspected gastrointestinal, liver, nerve and respiratory, skin and sense organ POISON.
Gelatin
Produced from selected pieces of calf and cattle skins, de-mineralized cattle bones and pork skin. ALLERGIC reactions have been reported.†
Gentamicin Sulfate and Polymyxin B [antibiotics]
ALLERGIC reactions can range from mild to life threatening.†
Genetically Modified Yeast, Animal, Bacterial and Viral DNA
Can be incorporated into the recipient's DNA and cause unknown GENETIC MUTATIONS.
Glutaraldehyde
Poisonous if ingested. Causes BIRTH DEFECTS in experimental animals.
Formaldehyde [formalin]
Major constituent of embalming fluid; poisonous if ingested. Probable carcinogen; suspected gastrointestinal, liver, respiratory, immune, nerve and reproductive system POISON.
Human and Animal Cells
Human cells from aborted FETAL TISSUE and human albumin. Pig blood, horse blood, rabbit brain, guinea pig, dog kidney, cow heart, monkey kidney, chick embryo, chicken egg, duck egg, calf serum, sheep blood and others.
POISON
Latex Rubber
Can cause life-threatening allergic reactions.†
Mercury [thimerosal]
One of the most poisonous substances known. Has an affinity for the brain, gut, liver, bone marrow and kidneys. Minute amounts can cause nerve damage. Symptoms of mercury toxicity are similar to those of AUTISM.
Micro-Organisms
Dead and alive VIRI AND BACTERIA or their toxins. The polio vaccine was contaminated with a monkey virus, now turning up in human bone, lung-lining (mesothelioma), brain tumors and lymphomas.
Monosodium Glutamate
[MSG | glutamate | glutamate acid]
A NEUROTOXIN that's being studied for mutagenic, teratogenic (developmental and monstrosities) and reproductive effects. Allergic reactions can range from mild to severe.†
Neomycin Sulfate [antibiotic]
Interferes with vitamin B6 absorption. An error in the uptake of B6 can cause a rare form of epilepsy and mental retardation. ALLERGIC REACTIONS can range from mild to life threatening.†
Phenol | Phenoxyethanol [2-PE]
Used as anti-freeze. TOXIC to all cells and capable of disabling the immune system's primary response mechanism.
Polysorbate 80
Know to cause CANCER in animals.
Tri (n) Butylphosphate
Suspected kidney and nerve POISON.
† When babies are hours or days old it is impossible to know if they have an allergy.

The foundation of medical science is built upon assumptions. We assume that the polio vaccine eradicated the disease, but it was in steady decline well before it was developed.

There is *no scientific evidence* to show that vaccines are safe and effective, but we do know that after the introduction of vaccines, the death rates attributed to these diseases plummeted. But there is an inherent problem with this logic.



Measles was 99% gone before the vaccine came out, but the pharmaceutical companies were still deemed the saviours, due largely to a powerful propaganda campaign.

Since *correlation does not imply or promise causation*, the disappearance of these diseases could be attributed to better hygiene, improved sanitation, as well as a number of other technological advances, all of which came to the scene at the same time as vaccines.

=> https://en.wikipedia.org/wiki/Correlation_does_not_imply_causation

All of a sudden we had flushing toilets and clean running water. We became aware of the importance of nutrition and food sanitation. We covered cesspools and cleaned up the stables and the streets. Better technology, hygiene, and sanitation allowed us to live more salubrious lives, free of dis-ease.

These changes were made well before vaccines were introduced and as a result death rates for these diseases dropped significantly. It just so happens that after these vaccines were introduced, they continued to drop.

Around the same time that vaccines were hailed as the magical bullet for health, we also decided to stop feeding our children 'swill milk', or milk that came from cows that were fed 'swill', which a waste product of alcohol distilleries. They used to park CAFO dairy farms next to distilleries. These disillusioned dairy farmers would feed their cows this toxic sludge that's left over from making booze in an attempt to save some cash on cattle feed. We have moved away from this idiotic practice, but have still not learned our lesson, as today's cows are on antibiotics and growth hormones.

There was never a vaccine for Tuberculosis or Scarlet Fever, yet these diseases disappeared. Measles was 99% gone before the vaccine came out. Polio was well on its way out too. It was not vaccines, but drastically improved hygiene, clean water, better nutrition, sanitation and living conditions that got rid of the "vaccine preventable diseases".

The proponents of vaccination and the germ theory never show us the data before the vaccines were introduced. It might seem like the vaccines worked if we only are shown the data from after the time they were introduced. What caused the steep decline in deaths attributed to Pertussis before the vaccine came out? Maybe we should be more concerned with this data.

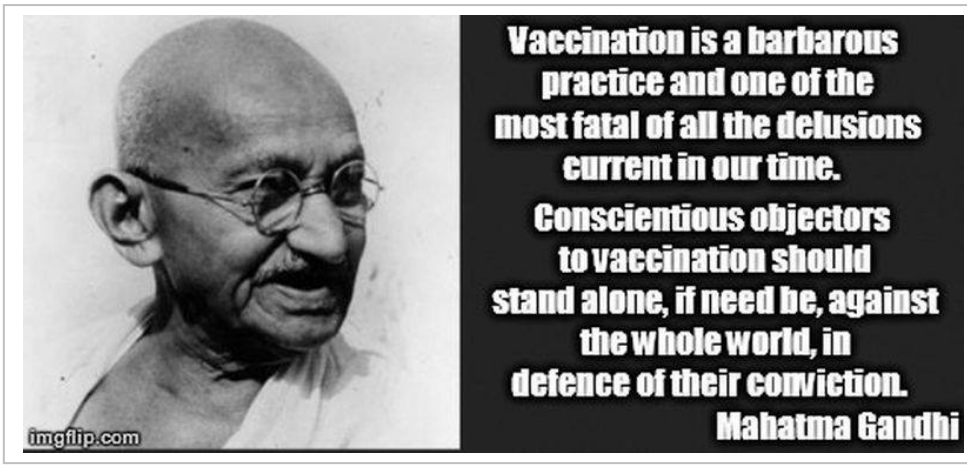
Defenders of vaccination often use logical fallacies or flaws in reasoning. A good example is the 'appeal to emotion' fallacy. "Have you ever seen a kid with iron lungs? Why didn't you vaccinate Timmy?", they'd incorrectly argue. Defenders of vaccines will often use this type of logic to try to win their argument. They are sometimes successful, but only with conversations and debates with people ignorant of these logical fallacies. Another popular one is the appeal to authority fallacy. Though the course of history we are constantly reaffirmed that the experts don't know best.

The Latin phrase "post hoc ergo propter hoc" means, literally, "after this therefore because of this." The post hoc fallacy is committed when it is assumed that because one thing occurred after another, it must have occurred as a result of it. People who argue that the polio vaccine saved us from polio don't understand that their opinion is based on this fallacy in reasoning.

Take the recent cholesterol myth as a prime example. The American Heart Association has long recommended low fat meals, and replacing saturated fats with trans fats and toxic vegetable oils. They changed their minds in 2014, now recognizing their faults, and the tens of thousands of deaths attributed to their bad advice. Listening to the ostensible experts can literally kill you.

...

The authorities have been wrong before. For this reason we can never rely on them. We must investigate these issues in depth on our own. etc. ...



Vaccination is a barbarous practice and one of the most fatal of all the delusions current in our time.
Conscientious objectors to vaccination should stand alone, if need be, against the whole world, in defence of their conviction.
Mahatma Gandhi
imgflip.com

> Vaccination is a barbarous practice, and it is one of the most fatal of all the delusions current in our time, not to be found even among the so-called savage races of the world. Its supporters are not content with its adoption by those who have no objection to it, but seek to impose it with the aid of penal laws and rigorous punishments on all people alike. The practice of vaccination

Mahatma Gandhi, A Guide to Health.

They confirm the murder of a lawyer and 3 missing doctors in Guerrero

SDPpnoticias 24 June 2015, 14:11 GMT-5
https://www-sdpnoticias-com.translate.goog/local/guerrero/asesinato-confirman-abogado-3.html?_x_tr_sl=auto&_x_tr_tl=en&_x_tr_hl=en

The three doctors and the lawyer were recent graduates of the Autonomous University of Guerrero, and worked in Acapulco.

Mexico.- After three doctors and a lawyer who worked at a community hospital were reported missing on June 19, they were found this Wednesday, a relative confirmed that one of the four bodies found in Santa Bárbara corresponds to one of these three people.

The three doctors and the missing lawyer were graduates of the Autonomous University of Guerrero (UAG) , the state attorney general, Miguel Ángel Godínez Muñoz confirmed that they were murdered at kilometer 42 that leads to the community of Santa Bárbara .

The doctors are Marvin Hernández **Ortega**, José Oswaldo **Ortega Saucedo** and Raymundo **Tepeque**, and the lawyer Julio César Mejía **Salgado**, according to Marvín's uncle, Romualdo Hernández Albines , all worked in Acapulco.

Until now, there is information that they were murdered between the communities of Chilpancingo, Santa Bárbara and Santa Mónica; their relatives hoped to find them alive.

The bodies were taken to Chilpancingo for an autopsy, and then they will be handed over to their relatives to be buried.

NDTV WORLD

4 Bodies Found in Car in Southern Mexico

NDTV World, 25 June 2015, 6:56 am IST
https://www.ndtv.com/world-news/4-bodies-found-in-car-in-southern-mexico-775022

Acapulco, Mexico: Authorities found four bodies inside a pick-up truck in Mexico's troubled southern state of Guerrero on Wednesday and relatives fear they might be three missing doctors and a lawyer.

The vehicle was abandoned in Santa Barbara, a community between the Pacific beach resort of Acapulco and the state capital Chilpancingo, officials said.

Families of the missing doctors and lawyer said the state prosecutor's office told them that their relatives were the victims.

Officials contacted by AFP would not confirm the identities.

"We had hoped to find them alive. We are all very sad," Romualdo Hernandez, uncle of one of the missing, told a news conference.

An official in the prosecutor's office said the four young men were kidnapped by an armed group on the federal highway linking Mexico City to Acapulco as they headed to Chilpancingo.

Guerrero is one of Mexico's poorest and most violent states. On Monday, 10 bodies were found in clandestine graves on the outskirts of Acapulco.

Dr. Teresa Sievers

Meet the Doctor

Dr. Teresa Sievers, 2015
https://web.archive.org/web/20150813072632/https://www.drteresasievers.com/about_us.php#.VcxGq3nP32d

In 1996 Dr. Sievers graduated with honors from Ross University School of Medicine. After completing her residency at the University of Florida in Jacksonville, where she was awarded resident of the year, she became board certified in Internal Medicine. While she initially practiced conventional medicine, Dr. Sievers believed there was more to medicine than prescribing pills. Despite everything conventional medicine had to offer, patients were not getting better.

At the same time, she noticed the correlation between her healthy lifestyle and good health. She realized she needed to take this same approach with patients. And while that was not part of her conventional training, she knew it worked. She immediately began exploring other healing modalities, and ultimately went back to school.

In 2008, Dr. Sievers completed a board certification and fellowship at the American Academy of Anti-Aging, Regenerative & Functional Medicine.* Four years later, she obtained a Medical Master of Science Degree in Metabolic & Nutritional Medicine through the University of South Florida. To date it is the only program of its kind offered through a medical school and it's what sets her apart in her field. This healing perspective uses an integrated approach to metabolic and nutritional medicine, providing solutions to current biomedical problems, including biomedical aging.

Armed with formal training and education in integrative and functional medicine, Dr. Sievers was now able to help many patients, offering treatments largely unavailable with conventional medicine. With a strong foundation in nutrition, toxin removal and hormone balancing, Dr. Sievers could now diagnosis and treat disease that in the past eluded her, including fibromyalgia, autoimmune diseases, depression, and weight loss.

Yet even though she was helping patients age gracefully, preventing much feared age-related illness, such as diabetes, cancer, heart disease, dementia and osteoporosis, she still had conventional-minded patients who were looking for the 'holy grail' in the perfect pill. At the same time, Dr. Sievers was also baffled with some patients who still were not getting well. She knew there was still something missing, and she was determined to find out what it was. After receiving private certification from the American Board of Integrative and Holistic Medicine, her eyes were once again opened.

Intrigued by Eastern medicine, Dr. Sievers began exploring this ancient discipline and found the last piece of the puzzle: the mind, body and spirit connection and energetic healing. She jumped at the chance to study with one of the fathers of holistic medicine, Dr. Norman Shealy, MD, PhD and became certified in transcutaneous acupuncture.

Focusing on the role quantum energy healing plays in connecting the mind, body and spirit, Dr. Sievers was able to take her practice to the next level. This ancient healing is offered at her practice by Lenka Spiska, LMT, Intuologist, Medical Intuitive and Quantum Energy Healer. Lenka sees clients in Sievers' office and helps release energetic blockages to bring about the emotional and spiritual healing that is required to heal on the physical level.

Dr. Sievers holds regular speaking engagements, seminars and workshops alone and with Spiska. She has been a contributing author to several SWFL publications including *eBella, Fit Nation* and *SWFL Health and Wellness* magazines. She has been a guest on local radio shows, featured on local news and appeared on TV shows including *Dialogue with a Doc* and Doug Kaufmann's *Know the Cause*. She is currently in the process of writing a book detailing how, as a conventionally trained MD, she made the quantum leap to energy healing.

News-Press.

Friends, family mourn Estero doctor Teresa Sievers

The News-Press, 29 June 2015
https://www.news-press.com/story/news/local/bonita-springs/2015/06/29/the-sheriffs-office-investigating-death-in-bonita-springs/29474437/

The killing of a popular Estero doctor has left family and friends puzzled and saddened.

The body of Dr. Teresa Ann Sievers, 46, was found Monday morning at her Jarvis Road home after she didn't arrive at work.

"We don't know anything but that she was murdered," said Sievers' sister, Annie Lisa, 52. She said Sievers, her husband and children had come to Connecticut for a gathering and her sister flew home alone Sunday. "She called her husband and told him she got there safely," Lisa said. "We don't know what happened."

Lisa said she and other family members were making preparations to come to Florida.

The Lee County Sheriff's Office declined to discuss the case, saying it was an ongoing homicide investigation, but assured neighbors that there was no threat in the area, but they reminded residents to lock their doors.

Tiffany Wood, a sheriff's office spokeswoman, said the neighborhood, south of East Terry Street, rarely has any problems.

The neighborhood remained taped off Tuesday with crime lab vans and other sheriff's units parked in front of the home at 27034 Jarvis Road.

"Certainly, people wonder about their safety because that's not a bad neighborhood," said Sharon Hood, founder and publisher of the Naples-based eBella Magazine.

Sievers appeared on the May cover of eBella Magazine and spoke at conferences the magazine held.

"She always wanted to empower women," Hood said.

Sievers was well-known in Southwest Florida for writing about women's health issues and concerns. She wrote for several publications, including The News-Press, and appeared on local television.

"When you were in her presence, there were a zillion ideas that could come out," Hood said. "She never lacked in ideas, she always had new project."

Sievers had a profound commitment to the blending of traditional and holistic medicines, Hood said.

"To her there was room for both," she said. "She felt they could compliment one another."

Hood said her staff was saddened by the death of their friend since they heard Monday night.

"Somebody who's been cut down in their prime, it brings everybody back to their mortality," she said. "... She was small in stature but large in spirit ... a real spitfire."

What Hood remembers most is that Sievers was always seemingly in motion.

"She didn't let a lot of grass grow under her feet," Hood said.

Sievers leaves behind her husband Mark and their two daughters, ages 8 and 10, which is especially tragic, she said. "It's hard to know somebody who had so much life and know you're never going to see them again," Hood said.

Sievers was particularly interested in helping people avoid age-related disorders.

She described the type of medicine she practiced on her LinkedIn page: "Often when patients come to see me they have seen several conventional medical doctors and are not getting the answers they want or more importantly they are not getting better. My goal is to prevent age-related illnesses such as diabetes, heart disease, dementia, cancer, osteoarthritis, osteoporosis as well as look for root causes of problems."

Sievers operated the Restorative Health & Healing Center in the Estero Medical Center off Three Oaks Parkway and Coconut Road. A sign was placed on her office's door informing patients of her death Tuesday, but employees at the Arco Road practice in Estero declined comment.

Lisa said her sister was board certified in internal medicine, held a medical master of science degree in metabolic and nutritional medicine, and obtained numerous private certifications in anti-aging, functional, integrative and holistic medicine, and transcutaneous acupuncture.

"After nearly 20 years of clinical experience and years of additional training, she is one of the first medical doctors in Southwest Florida to openly embrace and offer energetic healing, allowing her to offer her patients a complete healing toolkit at "Restorative Health and Healing," Lisa said in an information email about her sister's writings sent to The News-Press before the killing.

In 1996, Sievers graduated with honors from Ross University School of Medicine. She became board certified in internal medicine after completing her residency at a University of Florida in Jacksonville, where she was awarded resident of the year.

A spokeswoman for Naples Community Hospital, Debbie Curry, said Sievers had community affiliation privileges with the hospital. Sievers also held clinical faculty status at the University of South Florida College of Medicine in Tampa.

Sievers has done endocrinology work for those who identify as transgender individuals.

Sievers volunteered with Our Mother's Home, a transitional home for teen mothers and their babies near San Carlos Park.

"She wanted to make a difference for young girls who needed that," Hood said.

"Dr. Sievers had so much more life to live and many more contributions I know she would want to give," Hood said. "She will be greatly missed and we can only hope to help fill in some of the gap by staying involved in Our Mother's Home in her honor."

Karen Watson, director of Our Mother's Home, said she knew Sievers as a caring person who had been active with the house since 2007, resigning in March from the board to focus on her practice.

"She was a loving, kind person," Watson said.

About Dr. Teresa Sievers

• Dr. Teresa Sievers was born in Ansonia, Connecticut, and moved in 1996 during her internal medicine residency at UF Health Jacksonville. She moved to Bonita Springs in 2005 and completed further post doctoral training in anti-aging and functional medicine.

• She was the founder of Restorative Health and Healing Center, an integrative practice, in Estero. She volunteered with Our Mother's home and headed a weekly parenting and mentoring class at Our Mother's Home.

• She was married with two children. She was a vegetarian and self-proclaimed chef.

• Sievers was a 2012 top five finalist in the Apex Awards presented by the Fort Myers Chamber of Commerce Women in Business.

Door County search for missing Fox Valley doctor

We are Green Bay, 1 July 2015
https://web.archive.org/web/20150709021338/https://www.wearegreenbay.com/1fulltext-news/d/story/the-door-county-sheriffs-department-needs-the-pub/22208/JUE7QWRMRUyuyon95geVLQ

Ephraim, WI (WFRV) – The Door County Sheriff's Department is looking for a missing person who was last seen in the Ephraim area of northern Door County on 06-29-15:

Dr. Jeffrey R. Whiteside M/W DOB: 05-07-52 Age: 63
Height 5'09" Weight 185 lbs Hair: Brown Eyes: Brown
He was last seen wearing a maroon colored polo shirt and gray shorts. He wears eye glasses.

Dr. Whiteside is a physician in the Fox Valley area and lives in Grand Chute, Wisconsin. He has a boat slip and vacation cabin in Ephraim. Dr. Whiteside was with family on 06-29-15 at the boat slip in Ephraim when he walked away. He is believed to be on foot and still in the northern Door Co. area to the best of our knowledge. His family and office have not heard from him and are very concerned about his well-being.

The Door Co. Sheriff's Department was notified that Dr. Whiteside was missing on 07-01-15 at 0906 hrs. The Door Co. Sheriff's Dept. along with Ephraim Fire Department volunteers and others continue to look for Dr. Whiteside and search efforts are concentrated in the Ephraim area.

The Door Co. Sheriff's Department asks for the public's assistance in finding Dr. Whiteside. If anyone has seen Dr. Whiteside, please call the Door Co. Sheriff's Department at 920-746-2416.

Neighbors say hammer used in Bonita doctor's murder

NBC-2, 4 July 2015, 10:36 AM CUT
https://web.archive.org/web/20150706125823/http://www.nbc-2.com/story/29472864/neighbors-say-hammer-used-in-bonita-doctors-murder#.VZp7eXnP32c

Onita Springs, FL - The family of a Bonita Springs doctor murdered inside her home says they hope to carry on her legacy. Dr. Teresa Sievers, a wife and mother of two young girls, was found dead on Monday.

Investigators won't say how she was killed or if they have any suspects, but neighbors say a hammer was used in the crime.

Detectives were back at Sievers's home for the fifth straight day Friday collecting evidence. Neighbors tell us they heard from law enforcement that this was a gruesome murder scene, some even say it involved a hammer.

Neighbors also reported to detectives that a tan-colored pickup truck was parked at the home the morning Dr. Sievers was found dead.

Meanwhile, her family prepares for the first holiday without her, and her funeral early next week.

"I didn't think it was possible. My sister had a spirit I thought would go on forever and ever," said Annie Tottenhan-Lisa, Sievers' sister.

The crime was one Annie Tottenhan-Lisa never anticipated – hearing that law enforcement is searching for her sister's killer.

"I tried to find reasons. I'm angry, of course. But I'm trying to think of the big picture. I don't want her death to be in vain," said Tottenhan-Lisa.

Dr. Sievers was a mother of two young girls and married to Mark Sievers.

"He adored Teresa. He worshiped the ground she walked on. He did anything and everything so that Teresa could tirelessly work," said Tottenhan-Lisa.

Sievers' work as a holistic doctor focused not just on healing the body, but the mind and spirit as well, according to her close friend and colleague.

"After every session with them, which was never less than an hour, she would up with a prayer with them," said Lanka Spiska, who worked alongside Dr. Sievers for four years.

A van was taken out of the family's garage on Friday and towed away. Fingerprint ink covered the side fence outside the home.

As investigators continue to search for Sievers' killer, her family is focusing on the legacy she leaves behind.

"Life goes on. That's what she would want us to do. Carry her passion and her work," said Spiska. "She would be very angry with me if she knew I was just sitting down and crying and giving up."

Neighbors say the street would usually be covered with kids playing and riding bikes on a holiday weekend. But with a killer on the loose, that is not the case.

Medscape

Alicia Ault

Questions Surround Death of Controversial Autism Physician

Med Scape, 10 July 2015
https://www.medscape.com/viewarticle/847772?form=fpf

There is still little that is definitive about the death of Jeffrey James Bradstreet, MD, a physician who employed unorthodox techniques in treating the children who came to his autism-focused practice in Georgia.

Dr Bradstreet's body was found June 19 in the Rocky Broad River in Chimney Rock, North Carolina, with "a gunshot wound to the chest, which appears to be self-inflicted," according to the Rutherford County Sheriff's Office.

The sheriff's office said that his body would be sent for an autopsy, which was to be conducted on June 23. Results have not yet been made public.

Meanwhile, the US Food and Drug Administration (FDA) and the Georgia Drugs and Narcotics Agency reportedly searched Dr Bradstreet's clinic in Buford, Georgia, in the days before his death. The Georgia agency investigates the diversion of controlled substances and inspects any facility that is licensed to handle, possess, distribute, or dispense pharmaceuticals.

According to a search warrant issued on June 16 by the US District Court for Northern Georgia, the two agencies went to Dr Bradstreet's office to shut down the illegal use of globulin component macrophage-activating factor (GcMAF). That unapproved agent has been studied as a potential immune booster and anticancer drug.

Now 8 Disappeared, Dead Doctors: Wrong corpses, frightening Links

Mother Nature and You, 11 July 2015
https://mothernatureandyou.org/2015/07/11/now-8-disappeared-dead-doctors-wrong-corpses-frightening-links/

Adding to mysterious deaths and disappearances of three American holistic anti-vaccine doctors in one state over the past two weeks plus three Mexican doctors and their two employees recently disappeared, supposedly found dead in the back of a pickup on June 19, are two more doctors missing, possibly disappeared in the US. Earlier this year, another holistic doctor met an untimely death after months of pleading for help as a self-identified Targeted Individual, as reported by Deborah Dupré. It has emerged that most of these had at least one common link.
=> https://beforeitsnews.com/alternative/2015/04/secret-society-hacks-to-death-targeted-individual-doctor-3131626.html

Dr. Patrick Fitzpatrick, a retired opthalmologist who had practiced in North Dakota, went missing in neighboring Montana around July 3rd. Fitzpatrick, 74, is an MD specializing in Ophthalmology. NBC reports that the vehicle and trailer of Bismark resident Dr. Fitzpatrick were found abandoned next to a pea field Saturday, south of Willow Creek, near Three Forks, sheriff's officials reported.

"Officials believe Fitzpatrick could have abandoned his vehicle as early as Friday. He is described as 6' tall and over of 220 lbs. He has white hair and a goatee, and speaks with an Irish accent." Anyone with information about Dr. Fitzpatrick is asked to call the Sheriff's Office: 406-582-2100." https://web.archive.org/web/20150706125823/http://www.nbc-2.com/story/29472864/neighbors-say-hammer-used-in-bonita-doctors-murder#.VZp7eXnP32c

Also mysteriously missing as of June 29 is physician and preventive health advocate **Dr. Jeffery Whiteside**, in Fox Valley area, residing in Grand Chute, Wisconsin. Door County Sheriff's Department is reportedly looking for Dr. Whiteside, last seen in the Ephraim area of northern Door County at a family vacation home and boat slip in Ephraim. He was last seen walking away from his boat slip at the family gathering.

WFRV reports on Dr. Whiteside, saying he is M/W DOB: 05-07-52 Age: 63, Height 5'09" Weight 185 lbs Hair: Brown Eyes: Brown, He was last seen wearing a maroon colored polo shirt and gray shorts. He wears eye glasses.

https://web.archive.org/web/20150709021338/https://www.wearegreenbay.com/1fulltext-news/d/story/the-door-county-sheriffs-department-needs-the-pub/22208/JUE7QWRMRUyuyon95geVLQ

Dr. Whiteside's boat slip and vacation cabin is in Ephraim. Officials say he is believed to be on foot and still in the northern Door Co. area. Door Co. Sheriff's Department was notified that Dr. Whiteside was missing on 07-01-15 at 09:06 hrs. The Door Co. Sheriff's Dept. along with Ephraim Fire Department volunteers and others continue looking for Dr. Whiteside, with search efforts concentrated in the Ephraim area. The Sheriff's Department asks for the public's assistance in finding Dr. Whiteside. If anyone has seen Dr. Whiteside, please call the Door Co. Sheriff's Department at 920-746-2416.

Whiteside is a doctor at Fox Valley Pulmonary Medicine, serves as ThedaCare Board of Trustees secretary and is an Executive Committee member. He was previously president of Appleton Medical Center and ThedaClark Medical Center staff.

"Thousands of employees worked and work with (Dr. Whiteside) and the same number of patients have been helped by him," said Megan Mulholland, spokeswoman for ThedaCare. "He has never stopped caring and developed long-term relationships with those patients."

"The longer he remains missing the more suspicious it is," said Chief Deputy Pat McCarty, Door County Sheriff's Department.

The second doctor, also holistic in his anti-vaccine advocacy, is **Dr. Bruce Hedendal** DC PhD of Boca Roton area (E Coast, North of Miami).

=> https://www.legacy.com/us/obituaries/palmbeachpost/name/bruce-hedendal-obituary?id=16020662

Dr. Hedendal suddenly died on Father's day. His body was found in his car, but there was no accident nor was the car running. Hedendal held a PhD in nutrition from Harvard and a colleague of his said he was in great shape, "very healthy."

Bradstreet's family have established a GoFundMe campaign, asking for donations to assist them in pressing for a thorough investigation into what happened to him. Their GoFundMe web page says the need support "To find the answers to the many questions leading up to the death of Dr Bradstreet, including an exhaustive investigation into the possibility of foul play. Thank you for your support!."

Holisitic **Dr. Teresa Ann Sievers** MD, 46, also in Florida, in the Naples area of the South West coast in Bonita Springs, was found dead on June 29 in what has been ruled a homicide.

=> https://www.news-press.com/story/news/local/bonita-springs/2015/06/29/the-sheriffs-office-investigating-death-in-bonita-springs/29474437/

She was a well loved, popular holistic medical doctor, according to her clients, website and close associate. "Sievers' work as a holistic doctor focused not just on healing the body, but the mind and spirit as well, according to her close friend and colleague," NBC reported.

Dr. Sievers lived in a safe area where neighbors said problems are rare, if ever. That is no deterrent, however, to dangerous stalkers, including multi- or gangstalkers who work in organized groups. She was murdered in her home while her husband and children were with relatives in Connecticut. She'd flown home alone the night before. Her body was found Monday morning at her Jarvis Road home after she didn't arrive at work. Sievers' neighbors, however, describe hearing screams on day of death. Her murder has reportedly left family and friends puzzled.

"We don't know anything but that she was murdered," said Sievers' sister, Annie Lisa, 52. She said Sievers, her husband and children had come to Connecticut for a gathering and her sister flew home alone Sunday, according to News Press.com.

"The 46-year-old victim's relatives remained mystified as to who would want to harm the beloved physician who dedicated her life to helping women and girls," the Daily Mail reports.

The professional's neighbors said they are now concerned for their own safety, especially because authorities have remained tight-lipped about the circumstances surrounding her murder.

'I'm very scared for my safety,' resident Donetta Contreras told WINK News, based in southwest Florida.

Lee County Sheriff's Office said Wednesday they were pursuing several leads in connection with the slaying. They reassured locals that no threat to the general population exists and that the murder was targeted, not random, (no reassurance whatsoever to the thousands of self-denitrified targeted individuals).

Sievers's husband Mark, office manager at Sievers' Restorative Health & Healing Center clinic, is said to have adored his wife and worked hard for her tireless contribution to clients. Neighbors say they heard from law enforcement that this was a "gruesome murder scene," some saying it involved a hammer. Neighbors reported to a tan-colored pickup truck was parked at the home the morning Dr. Sievers was found dead.

"It's a very complicated case; there are details I wish I could share, but I can't." Lee County Sheriff Mike Scott.

CBS reports on Dr. Sievers's death and a donation site on CBS's official website.
=> https://winknews.com/2015/07/01/new-details-in-murder-investigation-of-teresa-sievers/

Blogger Erin Elizabeth wrote from Florida, "A few still write that I shouldn't cover these stories, but I am a journalist, and now that 3 doctors have died so quickly from my state (at least one murdered) I feel I need to write about it."

Now, Elizabeth is uneasy about her fate.

"Dr. Bradstreet had lived just 45 minutes from us here in Florida before moving to the neighboring state of Georgia. I also have been with a prominent well known doctor for the last 6 years so this concerns me. Several high profile MD's have contacted me these last 2 weeks who are also concerned and mourn the loss of their colleagues."

Three Mexican Doctors and their Attorney Murdered

Added to the disappeared or deceased American doctors within the same couple of weeks *are three Mexican doctors plus their attorney*, a story that took an even more suspicious turn today. Authorities reported finding the three missing Acapulco, Mexico doctors and their lawyer dead in the back of a pickup on June 19, in the troubled southern *Mexico* state of *Guerrero*, around the time the American doctors began dying mysteriously. A prosecutor's office official then reported that the four young men were kidnapped by an armed group on the federal highway linking Mexico City to Acapulco as they headed to Chilpancingo, according to NDTV.
=> https://www.ndtv.com/world-news/4-bodies-found-in-car-in-southern-mexico-775022

Then, State Attorney General Miguel Ángel Godínez Muñoz told reporters Saturday that DNA tests confirmed the dead men were Dr. Raymundo Tepeque Cuevas, Dr. Marvin Hernández Ortega, Dr. José Osvaldo Ortega Saucedo and Julio César Mejía Salgado, the lawyer. The four were graduates of Autonomous University of Guerrero (UAG). The doctors worked at a community hospital, according to SDPnoticas.com.

Today, it is reported that before their disappearance, doctors Marvin Hernández Ortega and Reynaldo Tepeque Cuevas, and two "administrative employees" José Osvaldo Ortega Saucedo and Julio César Mejía Salgado, were traveling in a gray car that police later found in Xolapa riddled with bullet holes, blood stains, and shells from a semi-automatic AR-15 rifle. PanAm Post reports that to get the case closed as quickly as possible, officials delivered the wrong corpses, not those of the doctors and their attorney (as originally reported) nor administrative employees.

Sunday, the victims' families again distributed leaflets, set up posters, and painted murals in Acapulco, as they had on Saturday to urge authorities to keep searching for the missing medical professionals. => https://web.archive.org/web/20151019102805/https://pueblo-guerrero.com/?p=16131

"Contrary to statements from Guerrero Attorney General Miguel Ángel Godínez Muñoz, their families do not believe they have yet been found," PanAm Post reports.

Possible Links

An anti-vaccine link has been posited regarding the first three American doctor meeting untimely deaths in June. Each of the three were anti-vaccine holistic doctors. The first was compassionate but controversial Autism researcher Dr. Jeff Bradstreet MD. His body was found far from home in a river, with a gunshot wound to his chest. => https://healthnutnews.com/famous-florida-autism-researcher-and-doctor-jeff-bradstreet-died-of-alleged-self-inflicted-gunshot-wound-and-found-in-a-river/

Officials were quick to rule suicide. Family and friends disbelieve this. Dr. Bradstreet treated hundreds of children with autism through chelation therapy at his medical clinic in Palm Bay, Florida. His son has autism that he believed was due to a vaccine induced reaction when 15-months old.

While many still view anti-vaccine doctors as quacks, Italy is one nation that does not do so anymore. On Sept. 23, 2014, an Italian court in Milan awarded compensation to a boy for vaccine-induced autism. (See the Italian document here.) A GlaxoSmithKline Infanrix Hexa vaccine against six childhood diseases caused the boy's permanent autism and brain damage. The vaccine contained antigens, thimerosal (mercury-containing preservative), aluminum, an adjuvant, and other toxic ingredients. The child regressed into autism shortly after receiving the three doses. The US media underreported the case.

Secrecy enshrouding vaccine adverse affects on the human population was also revealed in the case. Mary Holland, a research scholar and Director of the Graduate Legal Skills Program at NYU Law School, in a WorldTruth.Tv article, points to Presiding Judge Nicola Di Leo's consideration of another piece of damning evidence: a 1271-page confidential GlaxoSmithKline report (available on the Internet). This document provided ample evidence of adverse events from the vaccine, including five known cases of autism resulting from the vaccine's administration during its clinical trials.

In 2012, Judge Lucio Ardigo of an Italian court in Rimini presided over a similar judgment, finding the Measles-Mumps-Rubella (MMR) vaccine caused a child's autism. Both cases went underreported in the US and both court decisions flatly contradict decisions from the "U.S.. vaccine court," a Court of Federal Claim's Vaccine Injury Compensation Program. There, from 2007 to 2010, in the Omnibus Autism Proceeding, three decision makers, "Special Masters," found vaccines did not cause autism in any of six test cases, and one Special Master compared the theory of vaccine-induced autism to Lewis Carroll's Alice in Wonderland. The US government seems determined for autism to strike 50% of all children by 2025, as predicted by MIT senior researcher Dr. Stephanie Seneff. (See: Autism To Strike Half US Children In 10 Years: MIT Sr. Researcher Sounds Monsanto, Vaccine Alarm)

The American Medical Association (AMA) recently began crafting its 'ethical guidelines for physicians in the media' to 'defend integrity of the profession.' The new guidelines target unorthodox medical information that the AMA deems dubious and unsubstantiated and create disciplinary guidelines for doctors who make public claims that do not align with the 'best available science'. The AMA spent nearly $20 million on lobbying in 2014 alone. Its roots are deep into American medicine. It has a powerful influence over the way state licensing boards oversee and discipline physicians in the U.S.. –

Dr. Richard Horton, editor-in-chief of the well respected Lancet peer-reviewed medical journal, recently published a statement declaring that much published research is unreliable at best, if not completely false. "The case against science is straightforward: much of the scientific literature, perhaps half, may simply be untrue. Afflicted by studies with small sample sizes, tiny effects,

invalid exploratory analysis, and flagrant conflicts of interest, together with an obsession for pursuing fashionable trends of dubious importance, science has taken a turn towards darkness."

"Organized medicine would like nothing more than to continue lining their pockets with the profits generated by Americans who are dependent on medications rather than taking charge of their own health and wellness." (Erin Elizabeth)

Dr. Mark Sircus reported Wednesday on just how sleazy the American medical system is and how dangerous the FDA is: "It is hard not to think about doctors when talking about con games. The entire medical system is a con, a sleazy mix of lies and deception where medical studies are often not worth the paper they are printed on yet the FDA swallows medical studies as if they were chapters out of the bible."

In relation to vaccines, Dr. Sircus points to mercury in the flu vaccine as one example of the cocktail's danger:

"In the flu vaccine, there is a whopping 51,000 ppb (parts per billion) of mercury in the multi-dose flu vaccine—the most common type of flu vaccine given. How much is 51,000 ppb? It is 25,000 times the legal maximum for mercury in drinking water established by the Environmental Protection Agency. Keep in mind that when you inject mercury, it is 100% absorbed so it is more toxic to inject it as compared to eating it in fish or drinking it in water. Do pediatricians rise up against the CDC and complain?

"As far as I am concerned pediatricians, who inject children with the flu vaccine are criminals but like everything else, people are conned and very few complain," says Sircus. "There is little to no kindness in mainstream medicine because they are too busy making money practicing a form of human butchery that maims and kills people by the hundreds of thousands a year around the world."

Another possible link between at least two of the American doctors missing and the Mexican doctors is they had all had recent encounters with federal government officials.

Two of the American doctors had recently been contacted by federal agents.Both doctors Hedendal and Bradstreet reportedly had recent run-ins with US federal agents. FDA and DEA agents raided Dr. Bradstreet's office on June 16. Reportedly, federal authorities has also contacted Dr. Hedendaldays before his death, according to ABC7.

An associate of Bradtsreet stated under anonymity:

"I know enough about Jeff Bradstreet to know his state of mind. He was a sound thinker! He was prudent and calculated. Acting out on the spur of the moment and deciding to kill himself is like a joke. He was a jet pilot!… The one thing all instrument pilots share is a high IQ with the ability to multi task and make sound pragmatic decisions in emergency situations. In other words, [they] don't freak out!"

A commenter wrote that he'd spoken to Bradstreet while the agents were with him.

"I spoke to Jeff at 12:30 that Thursday just when the FDA was there. He was calm and told me there was a emergency he would call me back the next day, Friday. He was a genius, a very very smart man who would not have killed himself over this on such short notice."

El Sur reports that hours before their deaths, the Mexican doctors had also been in contact with government officials.

"The complaint details that the three workers took early Friday headed to Chilpancingo to reclassification procedures at the State Health Secretariat. They stopped in Acapulco, and one of the doctors borrowed the car [an SUV] Ibiza gray family to move to Chilpancingo. (sic) At noon they came to government offices to gather documentation requested dependency site when last seen. The document details that the three doctors returned around 3:00 pm bound for Acapulco…"

El Universal reported last Thursday that investigators found an abandoned taxi near the SUV and in the back of the vehicle, they found a shirt with the state police logo on it and a cartridge belt.

Violence against Mexican health workers is not new, says Escobar Secretary Habeica. Recent American history is also littered with government-sponsored covert targeting of individuals, people PI William Taylor say are "Americas' best people." Accidental deaths and suicides of scientists with evidence showing what mainstream touts as news is leaving a big gap in truth. These targets had potential to sabotage important agendas not in best interest of humanity. The five American doctors who recently died untimely deaths or remain missing are among 74 prominent scientists murdered over the past ten years.

Another commonality between the mystery disappearances and deaths is that families and friends are accusing officials of fraudulent reporting on the disappearances and/or deaths. In the US, funds have been established to pressure further investigations. In Mexico, family and friends are demanding full, transparent investigations.

"Cecilia Ortega Solórzano, mother of Hernández Ortega, disagrees with the official report: "The day we were told about the bodies, we went to identify them, but they didn't belong to our relatives, who have been missing for four days. These corpses were decaying as if they have been dead for 15 days," she said.

On June 28, the Mexican victims' families met with Governor Rogelio Ortega Martínez, who "does not believe the prosecutor … He is on our side, he believes us," relatives told local reporters. In a document delivered to the governor, they reject the forensic analysis and demand the prosecutor resign over his "ineptitude, lack of professionalism," and "attempts to impose" his conclusions. Guadalupe Reséndiz, a psychologist and wife of Tepeque, reported irregularities during the investigations. She says investigators tampered with the crime scene, and that the advanced decomposition of the corpses found suggests they died days before the physicians went missing.

Carlos Mejía Salgado, brother of Julio César, told press that he wants the federal police to run new DNA tests on the bodies. "We don't anything they tell us here anymore; evidence can be manipulated," he says.

One difference between Mexico and the US regarding the deaths and disappearances is that enough Mexican health worker targeted individuals have been disappeared for Mexicans to protest.

SOTT SIGNS OF THE TIMES

5 Médicos holísticos han sido encontrados muertos en cuatro semanas, otros 5 están desaparecidos

SOTT, 19 July 2015, 20:42 UTC
https://es.sott.net/article/39804-5-Medicos-holisticos-han-sido-encontrados-muertos-en-cuatro-semanas-otros-5-estan-desaparecidos

En los últimos meses, cinco médicos holísticos han muerto, ya sea misteriosamente o han sido asesinados intencionalmente, con otros cinco desaparecidos en circunstancias inexplicables.

Como se informó anteriormente, las muertes curiosas comenzaron el 19 de Junio, cuando el **Dr. Jeff Bradstreet**, un renombrado investigador del autismo de Florida, quien ejercía actualmente en Georgia, fue encontrado con una herida de bala en el pecho. La policía se apresuró en afirmar que la herida de bala fue autoinfligida, pronunciando la muerte como un suicidio casi de inmediato.
=> https://thefreethoughtproject.com/health/3-alternative-health-doctors-dead-run-ins-feds

La familia del médico sospecha un juego sucio, y crearon con los familiares una página de donaciones en un esfuerzo "Para encontrar las respuestas a las muchas preguntas que condujeron a la muerte del Dr. Bradstreet, incluyendo una investigación exhaustiva sobre un posible juego sucio."
=>https://www.washingtonpost.com/news/morning-mix/wp/2015/06/29/anti-vaccine-doctor-behind-dangerous-autism-therapy-found-dead-family-cries-foul/

La próxima muerte sospechosa se produjo sólo días después, el Día del Padre, 21 de Junio, cuando el **Dr. Bruce Hedendal**, Ph.D. DC, de la zona de Miami, fue encontrado desplomado sobre su coche sin pistas de la causa de muerte. Los detalles sobre la muerte de Hedendal son aún más turbios que el de Bradstreet, con muy pocos detalles liberados. Se reportó que Hedendal se mantenía en muy buen estado físico y de hecho había estado participando en un evento atlético el día antes de ser encontrado muerto.

Elevando el nivel de sospecha que rodea las muertes de estos médicos, está el hecho de que anteriormente ambos habían tenido problemas con los federales debido a sus tratamientos holísticos de los pacientes. Apenas unas semanas antes de la muerte de Bradstreet, su oficina fue allanada por la Administración de Alimentos y Medicamentos (FDA).

El mismo día en que se encontró el cuerpo de Hedendal, el **Dr. Baron Holt** DC fue encontrado muerto en Florida. Holt murió inesperadamente mientras viajaba a Jacksonville, Florida.

Aunque Holt de 33 años de edad, había estado luchando con problemas de salud recientes, sus seres queridos piensan que ninguno era una amenaza para la vida, según The News & Observer. El informe de Observer indicó que la familia está a la espera de los resultados del informe de la autopsia.

Como si tres médicos muertos del mismo campo, en la misma región del país, y en un lapso de tiempo tan corto no ha levantado banderas rojas, la **Dra. Teresa Sievers**, otro médico de salud natural de Florida, fue brutalmente asesinada en su casa el 29 de Junio.

Los compañeros de trabajo han dicho que era conocida como la "Madre Teresa del Sur de Florida." Las autoridades que investigan el caso han declarado que esto no fue un ataque al azar, sino un evento dirigido y que cuando los detalles se revelen , "libros y películas serán escritos sobre ella".

Luego, el 1 de julio, **Lisa Riley** DO, de 34 años, que reside en el condado de Lee, Georgia, fue encontrada asesinada en su casa, con una herida de bala en la cabeza. Su marido fue sospechoso inicialmente, ya que él hizo la llamada al 911 para informar de su muerte, pero muchos sienten como si estuviera siendo incriminado. Los investigadores han llamado su muerte misteriosa.

Algunos médicos también han desaparecido según *HealthNutNews*:

El 26 de junio, el **Dr. Patrick Fitzpatrick** MD desaparece. Viajaba desde Dakota del Norte a la vecina Montana (viaje que hacía a menudo ya que su hijo vivía en Montana), y su camioneta y el remolque fueron encontrados al lado de la carretera. Las búsquedas se han ampliado, pero las autoridades dicen que es como si hubiera desaparecido sin dejar rastro.

El 29 de junio, **Jefferey Whiteside** MD, neumólogo, desapareció cuando él simplemente "se fue". El Dr. Whiteside, conocido por su éxito en el tratamiento del cáncer de pulmón, desapareció en el condado de Door Wisconsin mientras estaba de vacaciones con su familia. Dicen que estaba a pie y no tenía vehículo, y numerosos reportes lo llaman "misterioso", diciendo que él también desapareció sin dejar rastro. Han estado buscando ahora por 2 semanas e incluso colegas se han unido (junto con muchos sabuesos, grupos de drones de búsqueda y helicópteros), pero no hay ni la más mínima prueba en 2 semanas.

El mismo día que se encontró el cuerpo del Dr. Bradstreet, el 19 de Junio, tres profesionales de la medicina desaparecieron sin dejar rastro en un tramo de distancia de la carretera en el estado de Guerrero, suroeste de México . Las autoridades insistieron en que los hombres habían sido asesinados, pero no ofrecieron evidencia creíble para respaldar la reclamación.

La naturaleza aparentemente sistémica en la que los médicos holísticos están terminando, ya sea desaparecidos o muertos, plantea serias interrogantes acerca de si alguna entidad o persona está posiblemente orquestando estos eventos. Con miles de millones de dólares en juego, qué tan lejos podrían llegar las grandes farmacéuticas en un esfuerzo de silenciar a aquellos que comparten sus conocimientos sobre curas naturales con el público?

¡Parece que ser un proveedor de salud holística que promueve la salud natural ahora puede ser peligroso para la propia salud!

The world news you're not supposed to notice !!!

If Vaccines are safe, why has the Gov paid out $3 Billion U.S.A.

Black listed News, 18 August 2015
https://web.archive.org/web/20170318162738/http://www.blacklistednews.com/If_Vaccines_Are_Safe%2C_Why_Has_The_US_Gov._Paid_Out_%243_BILLION_To_Vaccine-Injured_Families%3F/45751/0/38/38/Y/M.html

Vaccines are a very imperfect science, despite the good intentions of healthcare providers and parents seeking to protect their children from disease. Adverse, life-changing and deadly effects of vaccines are more common than ever. In fact, the *US govt has had to pay out over $3 billion to vaccine-injured families since* 1986. Still think vaccines are safe?

The Vaccine Adverse Events Reporting System (VAERS) lists several negative outcomes of vaccines. Many of these side effects are worse than the diseases these vaccines are for! VAERS reports that the MMR (measles, mumps, rubella) vaccine is "linked to febrile seizures, which are a type of seizure that occurs in infants and young children in association with fever."

Worse yet, VAERS reports that a whole slew of vaccines, including MMR, varicella zoster, influenza, hepatitis B, meningococcal and tetanus "are linked to anaphylaxis." Anaphylaxis shock can lead to sudden death. Many of these cases are under-reported, filed as SIDS, or sudden infant death syndrome.

Injection, regardless of vaccine type, is associated with loss of shoulder motion and fainting.

The committee that studied these horrific vaccine effects "also found convincing evidence of a causal relationship between injection of vaccine, independent of the antigen involved, and two types of adverse events, including syncope, or fainting, and deltoid bursitis, or frozen shoulder, characterized by shoulder pain and loss of motion."

Just the mere act of injecting viruses and sterilizing agents poses severe risks, since the body is not designed receive thesevaccine ingredients without first processing them through the normal route of body filters (including the skin, mucous membranes, gastrointestinal tract, kidneys and liver), or at all. It seems that putting these ingredients directly into the blood can easily create an adverse health event. The committee also found that the MMR vaccine often elicits joint pain in both children and adults.

The flu, which can easily be overcome with a strong immune system, is mild compared to some of the adverse effects associated with the flu vaccine. These effects include conjunctivitis, facial swelling and upper respiratory symptoms, including coughing and wheezing.

US Vaccine Court bypasses the true judicial process, protecting vaccine makers while paying off families affected by vaccine-induced autism

What no one completely understands is how the overload of vaccinations in the 21st century is a contributing factor to the rise of autism spectrum diagnoses (which is now a greater problem than the diseases we are trying to fight).

While the autism debate rages on, silently, the US Vaccine Court, established in 1986, has awarded several families large cash settlements after confirming that their child likely did become autistic because of vaccine(s).

This separate kangaroo vaccine court allows the vaccine manufacturers and pharmaceutical companies absolute immunity from true prosecution. The government handles their cases and pays families off with an excise tax collected from the sale of… you guessed it… vaccines. It's a vicious circle that circumvents the true judicial process. This dishonest system protects the profits of vaccine makers and doesn't hold them accountable for their harmful products. The excise tax the government uses to pay off families affected by vaccines is garnered by collecting $0.75 for every vaccine dose purchased by the Centers for Disease Control and Prevention.

In a true court of law, these adverse effects of vaccines would be put on trial. The vaccines would be investigated as a harm to the public, and the drug makers would be held accountable. Sadly, that's just not the case, and that's why so many people believe vaccines are safe today.

Here are three examples (of many recorded) linking vaccine damage to autism and encephalopathy

Here are three examples where the US Vaccine Court awarded compensation to families whose children were harmed by vaccines, resulting in autism or autism symptoms.

Richelle Oxley: DPT shot reaction: post-pertussis vaccine encephalopathy

"[N]o evidence to overcome the strong probability that the DPT was the most likely cause. … Richelle's disabilities include autistic-like behavior, hyperactivity, and partially controlled seizures. … The court finds further that all other statutory requirements have been met, and concludes that petitioners are entitled to compensation for injuries sustained as a result of the DPT vaccine administered on July 30, 1979."

Hannah Poling: MMR vaccine

"Court ruled in favor of compensation due to the significant aggravation of child's pre-existing mitochondrial disorder based on an MMR vaccine Table presumptive injury of encephalopathy, which eventually manifested as chronic encephalopathy with features of autism spectrum disorder and a complex partial seizure disorder as a sequelae."

Eric Lassiter: DPT vaccine

"Eric was completely healthy prior to a DPT booster. His is a 'known case of static encephalopathy after DPT immunization.' Based on the court's own findings of fact and the reasons proffered by Dr. Lichtenfeld, the court concludes that Eric, more likely than not, sustained an encephalopathy and that the first manifestation of onset of the injury occurred within the Table time frame."

SEE CONSPIRACIES, A10 ▶

...

"No matter what you believe about the how and why of the (9/11 attacks) on New York and Washington, D.C., it's a conspiracy theory," Dr. Matthew R.X. Dentith, a philosopher who lives in New Zealand and has written a book titled "The Philosophy of Conspiracy Theories," tells Florida Weekly in an interview conducted via email. "For example, if you accept the official theory, that's a

theory about a bunch of plotters who acted in secret to commit a terrorist attack. That is a theory about a conspiracy. It just happens to be one that is well-accepted."

This view that conspiracy theories can encompass the real as well as the imagined is echoed by another expert in the field, Dr. Joseph E. Uscinski, coauthor of the book, "American Conspiracy Theories." ...

In the matter of the *alternative doctors*, disparate and unrelated cases have been tied together with the thinnest of strings and presented as evidence of a vast plot whose aim is to silence those who criticize mandatory vaccinations and advocate for nontraditional medical practices. Those circulating this rumor/conspiracy contend that these practices threaten the very core of the Medical Establishment, which now seeks to annihilate its crusading enemies and mislead the public. According to Dr. Dentith, a dubious proposition such as this can make for a very "good" conspiracy theory.

"On one hand, a good conspiracy theory is a story of everything you know is wrong," he says. "So, the medical community is lying to you about the real reason for vaccinating your children. These stories endure because they often hint at real fears people have."

Barry and Honey Sherman: The mystery of the strangled billionaires

BBC News, Toronto, 4 February 2018
https://www.bbc.com/news/world-us-canada-42864082

The killing of a wealthy Canadian couple made headlines around the world. Then the news they had been found hanging by men's belts next to their indoor pool, with no apparent motive, deepened the intrigue. So who were Barry and Honey Sherman?

Barry and Honey Sherman

In an unpublished 1996 memoir, Barry Sherman wrote he had "always been very conscious of my personal mortality".

His unfinished musings only became public because of a court case . They revealed a man with strong beliefs - that there is no God, free will is an illusion, and life has "no meaning or purpose".

But Sherman thought these memoirs may one day be of interest to others - a "perhaps arrogant belief", he wrote.

Now, the text offers some insight into a couple whose mysterious deaths have captured worldwide interest and left those who knew them grief-stricken and dumbfounded.

In mid-December, 75-year-old Barry and his wife Honey, 70, were found dead in their Toronto home. Police confirmed this month their death is being investigated as a "targeted" double murder. They were found strangled, fully clothed on the deck of their indoor pool, hanging by belts.

Authorities have so far offered no suspects and no motive for the suspected killings.

More than 10,000 people, including Prime Minister Justin Trudeau and Ontario Premier Kathleen Wynne, attended the funeral.

The turnout was unsurprising - the Shermans had amassed a personal fortune estimated at $3bn. They had touched much of Canada, whether through the impact on Canadian healthcare of Apotex, Inc, the generic drug empire Barry founded, or through the millions they gave away in philanthropy.

At their funeral, their son Jonathon called them "yin and yang".

"They completed a circle that encompassed everything important about what it means to be human," he said. "Neither one perfect but together wholly balanced and exceptional."

Barry was a self-described workaholic, someone who brought business files with him on vacation. He was an ardent atheist, an aggressive businessman and a loving, though often absent father.

Honey was warm, the "magnet and the glue" that held the family together, an inveterate party animal who refused to let a bout of throat cancer or painful arthritis get in the way of either a good time or her charity work.

Thousands mourn Canada billionaire couple

...

Rubin says while Barry was tough, he can't comprehend who would kill him and Honey with such "hatred".

"I can't believe that my friend Barry... would die in this horrible way," he said. "The riddle is - who did it and why?"

Apotex donates Hydroxychloroquine for a clinical study to prevent infection from COVID-19 with front line Health care workers

Apotex, 23 March 2020

https://www1.apotex.com/global/about-us/news/2020/03/23/apotex-donates-hydroxychloroquine-for-a-clinical-study-to-prevent-infection-from-covid-19-with-front-line-health-care-workers

Toronto, Ontario, March 20th – 2020 – Apotex, Canada's largest pharmaceutical company, announced today that it is donating Hydroxychloroquine to accelerate a study examining if it prevents infection of COVID-19 in front-line healthcare employees.

The study, conducted by the University Health Network and Unity Health (St Michael's Hospital) in Toronto, aims to gather data from randomized controlled trials which is essential for informing the best practices in protecting our health care workers at this critical time. It is a PreExposure Prophylaxis randomized placebo controlled trial for front line health care workers including emergency room staff and ICU staff.

...

Global interest in Hydroxychloroquine has surged with some governments already adding the product to their COVID-19 treatment protocols. Other countries are also considering the impact of this product, including the United States who requested that it be made available for use immediately. ...

EMT John Mondello kills himself after less than three months on the job

New York Post, April 25, 2020 1:49pm
https://nypost.com/2020/04/25/nyc-emt-commits-suicide-with-gun-belonging-to-his-dad/

A rookie Bronx EMT, who went from the camaraderie of the FDNY academy directly into the horrors of the coronavirus pandemic, killed himself this week after less than three months on the job, police sources told The Post.

John Mondello, 23, used the gun registered to his father, a retired NYPD cop, to end his life Friday (April 24) in Queens, the sources said.

His body was spotted by passersby at 6:48 p.m. at 25-40 Shore Blvd. in Astoria on the rocks along the river wall.

He was lying face up with the weapon still in his hand, a gunshot wound under his chin, witnesses said. The firearm was registered to the elder John Mondello, a retired cop, the sources said.

The younger Mondello graduated the Fire Department's EMS Academy in early February, and went to work with the Tactical Response Group next to EMS Station 18 in Claremont — one of the busiest by 911 call volume in the city.

A friend and fellow graduate described him as "always very peppy, very happy."

But a few weeks ago — at the apex of the Big Apple's coronavirus crisis — Mondello reached out to his buddy, and said he didn't like his new job, the pal recalled.

The Tactical Response Group runs non-stop to areas with the busiest emergency call volume in the city.

The fellow EMT assured Mondello "everything was going to get better," and the two spoke about how "everyone feels stressed out and overwhelmed" and the notion that they got out of the academy and went "jumping into the pandemic, the high call volume."

They discussed the "chaos" and how they were seeing "people passing away right in front of you. We don't have the same union benefits as other city workers. It's really stressful to work long hours and not get paid as much," his pal added.

The heavy toll of coronavirus deaths weighed on Mondello, another friend told The Post.

"He told me he was experiencing a lot of anxiety witnessing a lot of death, he'd feel it was a heavy experience when he'd fail to save a life," said Al Javier.

Anthony Almojera, vice president of the EMS officers' union, said the devastation wrought by the virus is taking a toll on many of his crew members.

Before becoming an EMT, Mondello made ends meet delivering food for the K&L deli in Jackson Heights, from November 2015 until March 2016. "He was always smiling, always joking around. He never seemed upset," store manager Peter Lee said.

Top E.R. Doctor Who Treated Virus Patients Dies by Suicide

The New York Times, 27 April 2020, 1:48 p.m. ET
https://www.nytimes.com/2020/04/27/nyregion/new-york-city-doctor-suicide-coronavirus.html

"She tried to do her job, and it killed her," said the father of Dr. Lorna M. Breen, who worked at a Manhattan hospital hit hard by the coronavirus outbreak.

A top emergency room doctor at a major Manhattan hospital died by suicide on Sunday, according to her father.

Dr. Lorna M. Breen, the medical director of the emergency department at NewYork-Presbyterian Allen Hospital, died in Charlottesville, Va., where she was staying with family, her father said in an interview.

Her father, Dr. Philip C. Breen, said she had described devastating scenes of the toll the coronavirus took on patients.

"She tried to do her job, and it killed her," he said.

The elder Dr. Breen said his daughter had contracted the coronavirus but had gone back to work after recuperating for about a week and a half. The hospital sent her home again, before her family intervened to bring her to Charlottesville, he said.

It was not clear why Dr. Breen would have taken her own life. She did not have a history of mental illness, her father said. But he said that when he last spoke with her, she seemed detached, and he could tell something was wrong. She had described to him an onslaught of patients dying before they could even be taken out of ambulances.

"She was truly in the trenches of the front line," he said.

He added: "Make sure she's praised as a hero, because she was. She's a casualty just as much as anyone else who has died."

The hospital did not immediately respond to a request for comment.

Dr. Angela Mills, head of emergency medical services at many NewYork-Presbyterian campuses, including Allen, sent an email to hospital staffers on Sunday night informing them of Dr. Breen's death. The email, which was reviewed by The New York Times, did not mention a cause of death. Dr. Mills, who could not be reached for comment, said in the email that the hospital was deferring to the family's request for privacy.

"A death presents us with many questions that we may not be able to answer," the email read.

NewYork-Presbyterian Allen is a 200-bed hospital at the northern tip of Manhattan that at times had as many as 170 patients with Covid-19, the illness caused by the coronavirus. As of April 7, there had been 59 patient deaths at the hospital, according to an internal document.

Three Russian doctors fall from hospital windows, raising questions amid coronavirus pandemic

CNN, 7 May 2020.
https://edition.cnn.com/2020/05/04/europe/russia-medical-workers-windows-intl/index.html

Moscow CNN – Three frontline health care workers have mysteriously fallen out of hospital windows in Russia over the past two weeks, heightening public attention to the working conditions for doctors and medical professionals amid the coronavirus pandemic.

Two of those health care workers are dead, and one remains hospitalized.

All three incidents, which are being investigated by Russian law enforcement authorities, have prompted intense discussion in the Russian press and on social media.

Alexander Shulepov, an ambulance doctor in Voronezh, a city about 320 miles south of Moscow, is in serious condition after falling from a hospital window on Saturday. Local state television, citing regional health officials, said he fell out of second-floor window of the Novousmanskaya hospital, where he worked and was receiving treatment after testing positive for coronavirus.

Shulepov was hospitalized for coronavirus on April 22, the same day he and his colleague Alexander Kosyakin posted a video online saying that Shulepov had been forced to continue working after testing positive for coronavirus.

Kosyakin had previously criticized hospital administration for protective gear shortages on his social media and was questioned by the police for allegedly spreading fake news.

Kosyakin confirmed these details to CNN in an interview.

"[Shulepov] is an intensive care unit, as far as I know in a serious condition, last time I spoke to him was on the 30th of April, we checked in with each other," Kosyakin told CNN. "He felt fine, he was getting ready to get discharged from the hospital … and all of a sudden this happened, it's not clear why and what for, so many questions that I don't even have the answer to."

The regional department of Russia's health ministry told CNN in a statement that Shulepov "is a victim of an accident due to his own lack of caution" and is receiving all necessary medical care.

Police have not responded to CNN's request for comment.

The Novousmanskaya hospital said in a statement that Shulepov had been taken off a shift as soon as he informed the hospital administration about his positive diagnosis and was offered hospitalization in the infectious diseases ward.

Three days later, Shulepov retracted his previous statements, saying that in his video with Kosyakin he was "overwhelmed by emotions." The second video Shulepov recorded featured Igor Potanin, the head doctor of the Novousmanskaya hospital, who said his medical staff has enough protective equipment.

"I spoke about this to the department's employees: I won't let anyone go to outpatients or inpatients if we don't have enough means of protection, I told them I'd go myself there, but I will not send anyone," Potanin said.

It is rare for doctors to fall from windows in Russia, but Shulepov was the third health worker to fall out of a window in the country in the past two weeks.

On May 1, Elena Nepomnyashchaya, the acting head doctor of a hospital in the Siberian city of Krasnoyarsk, died after spending a week in intensive care, the regional department of the Health Ministry said in a statement.

Local TV station TVK Krasnoyarsk reported at the time that Nepomnyashchaya allegedly fell out of a window during a meeting with regional health officials, during which they discussed turning the clinic into a coronavirus facility.

Nepomnyashchaya was reported to have opposed those changes due to the lack of protective gear in the hospital. The Health Ministry's regional health department denied the allegations in a statement, adding that the hospital is in "reserve" for coronavirus patients and its staff has been trained and equipped. The hospital did not respond to CNN's requests for comment.

On April 24, Natalya Lebedeva, head of the emergency medical service at Star City, the main training base for Russia's cosmonauts, died in a hospital after a fall.

The hospital within the Federal Biomedical Agency, which says it treated her for suspected coronavirus, released a statement that "a tragic accident" occurred, without elaborating. The hospital did not respond to CNN's request for comment.

In the statement, the hospital said, "She was a true professional in her field, saving human lives every day!"

Anastasia Vasilyeva, the head of Alliance of Doctors union, told CNN she did not think anyone was deliberately targeting doctors. The incidents, she said, likely reflect the stress doctors are under in an underfunded system during a pandemic.

"This is really about the destruction of our health care system," said Vasilyeva, who has been a prominent critic of the government's approach to combating coronavirus. "A lot of clinics and hospitals have been closed … And, of course, this means it is very difficult to treat in such conditions a lot of patients with coronavirus."

Brazil plane crash: 61 people on board aircraft, airline says

Independent, 9 August 2024, 22:46
https://www.independent.co.uk/news/world/americas/brazil-plane-crash-sao-paulo-b2594133.html

President says all passengers of VoePass plane presumed dead after footage shows burning wreck in residential area of Sao Paulo state

A plane with 61 people aboard has crashed in a fiery wreck in a residential area of a city in Brazil's Sao Paulo state, killing everyone on board.

VoePass flight 2283 took off from Cascavel, in the state of Parana, just before noon on its way to the Sao Paulo-Guarulhos International Airport. The ATR-72 lost signal around 1:22 pm local time and crashed in Vinhedo, 50 miles northwest of Sao Paulo city.

Brazilian television network GloboNews showed footage of a large area on fire and smoke coming out of what appeared to be a plane's fuselage in an area full of houses. Officials confirmed the plane hit several homes as it crashed, CNN reports.

Sao Paulo's state fire brigade confirmed that a plane crashed in the city Vinhedo, about 50 miles northwest of Sao Paulo city, and said it had sent seven crews to the area.

VoePass originally reported 62 people were on board but has since updated the number, the Associated Press reports.

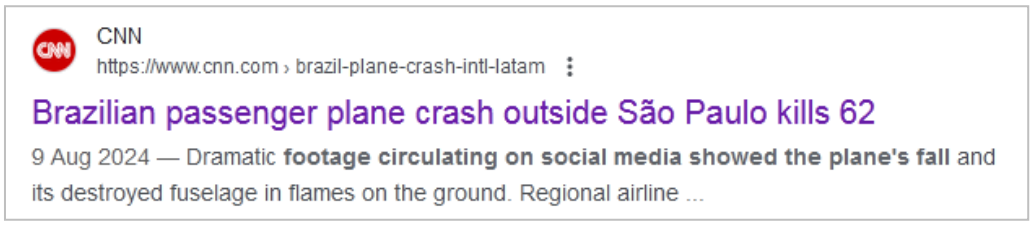
Brazilian passenger plane crash outside São Paulo kills 62

CNN, 9/12 August 2024, 3:14 PM EDT
https://edition.cnn.com/2024/08/09/americas/brazil-plane-crash-intl-latam/index.html

Vinhedo, Brazil CNN – A passenger plane carrying 62 people crashed outside São Paulo on Friday afternoon, killing everyone on board.



CNN
https://www.cnn.com › brazil-plane-crash-intl-latam
Brazilian passenger plane crash outside São Paulo kills 62
9 Aug 2024 — Dramatic footage circulating on social media showed the plane's fall and its destroyed fuselage in flames on the ground. Regional airline ...

Dramatic footage circulating on social media showed the plane's fall and its destroyed fuselage in flames on the ground.

Regional airline Voepass revised the number of fatalities up to 62 from 61 after confirming another passenger was on board. It earlier said that there were 57 passengers and four crew members on board.

All of the passengers had Brazilian documents, airline officials said. Portugal's foreign ministry said on Saturday that one Portuguese citizen traveling on the plane died in the crash. It is unclear if that passenger or any other victims had dual citizenship.

Flight tracking data shows that the ATR 72-500, a twin-engine turboprop plane, dropped 17,000 feet in just one minute, but it is not yet clear why.

Social media videos of the crash showed the plane spiraling out of the sky before hitting the ground as people in the neighborhood shouted in fear. Another video showed the wreckage of the plane in flames on the ground. No one on the ground was hurt, city officials told CNN.

The flight left Cascavel, in the Brazilian state of Parana, and was en route to Guarulhos, in São Paulo state, when it lost signal shortly before 1:30 p.m. (12:30 p.m. ET), according to Flightradar24 data.

It began losing altitude a minute and a half before crashing. The plane had been cruising at 17,000 feet until 1:21 p.m., when it dropped approximately 250 feet in 10 seconds. It then climbed approximately 400 feet in about eight seconds.

Eight seconds later, it lost just under 2,000 feet. Then, in approximately one minute, it began rapidly descending – losing roughly 17,000 feet in just one minute.

The last data transmission from the plane was at 1:22 p.m.

Luiz Augusto De Oliveira described the moment the plane struck part of his property. "The plane crashed at my house," he told Reuters. "There were three people in the house - me, my wife and the maid - we are all fine."

He continued, "We thought it was a helicopter in breakdown due to the noise … and suddenly we saw the aircraft exploding in the garage of my house."

Cause not yet known

There is no information yet on what caused the crash, Voepass CEO Eduardo Busch told a press conference.

"The entire crew was competent," Busch said. "We are waiting for access to all communications between the pilot and the control tower to have a broader understanding of what happened."

Busch said the plane had two black boxes – devices that store flight data which are built to withstand crashes – and that there are two highly qualified laboratories available to analyze them.

Authorities have so far retrieved 24 bodies from the crash site, Vinhedo mayor Darío Pacheco told a press conference on Saturday.

Of those, two victims – the pilot and the co-pilot – have been preliminarily identified based on visual recognition, he said, who added that the aircraft's black boxes had been recovered in working order and sent to Brasilia for analysis.

Earlier, Sao Paulo fire brigade spokesperson Maycon Cristo said all the victims were still seated during the crash and no bodies were ejected from the site due to the plane crashing flat onto ground, Cristo said.

"Officials are working row by row (of the crashed aircraft) to retrieve and identify the bodies," he told CNN, adding that the bodies are in such conditions that it's difficult to identify.

The recovery team is working from the cockpit and moving towards the tail, where the forensic work will be harder due to the damage caused by the fire following the crash, according to the spokesperson.

In order to help identify bodies, families have been asked to share medical documentation of the victims "such as radiological, medical and/or dental exams," said a statement released by the government of the state of São Paulo.

Interrupting a speech at an afternoon naval event to address the crash, Brazilian President Luiz Inácio Lula da Silva called for a minute of silence to mark the apparent deaths of the flight's passengers and crew.

"I would like everyone to stand up so that we can observe a minute of silence because a plane has just crashed in the city of Vinhedo… and it appears they all died," he said, in a video of his statement shared on X.

The president later declared three days of mourning for the victims.

Voepass officials said that the company spent the afternoon securing hotels and psychologists for the victims' families and providing them with support.

One resident recorded video of the aftermath of a plane crashing into her neighbor's house outside of São Paulo, telling CNN she was eating lunch in her kitchen when she saw the plane going down.

She ducked down in terror and started praying, she said, calling it a "moment of panic" for the whole city. Private roads leading up to the properties are now closed off to everyone, including residents, she said, and first responders are in the area.

An investigation begins

Vinhedo City Hall said in the Friday statement that it is waiting for the Brazil Air Force team to start investigating the cause of the crash.

Brigadier Marcelo Moreno, who heads Brazil's aviation accidents agency CENIPA, told a press conference that aircraft crew had not communicated an emergency prior to the crash. "Preliminarily, we have this information that there was no information about the aircraft, that the aircraft was in any type of emergency whatsoever," he told a press conference.

Busch, the Voepass CEO, said the airline will work closely with CENIPA to investigate the crash.

According to registration data from the Brazilian Aeronautical Registry, the Voepass airplane was manufactured in 2010 and purchased by the airline in September 2022.

The aircraft was "denied operation for air taxi," according to its registration data. But it's unclear why or when that determination was made at this time.

CNN has reached out to Brazil's aviation authority for more details about that determination.

ATR, the plane's manufacturer, says it was aware of an accident and is working to support investigators.

"What we can say at this point in time is that ATR has been informed that an accident occurred in Vinhedo, Brazil involving an ATR 72-500. Our first thoughts are with all the individuals affected by this event. The ATR specialists are fully engaged to support both the investigation and the customer," the statement said.

Flight experts speaking to CNN said ATR 72s, which are constructed by a European consortium, have a checkered past. There have been at least 15 incidents resulting in passenger deaths involving ATR turboprops recorded around the world.

Passengers who missed flight 'thank God'

Some people missed the tragic flight on Friday. A man who missed the flight told Brazilian news outlet Globo that at least 10 people were waiting at the wrong gate causing them to miss the flight.

"They said to me, mister, you're not getting on this plane because we're already past the boarding limit. I even pressured them a little – 'mister, put me on this plane, I have to go' – then he said, 'There's no way, what I can do is rebook your ticket,'" the man told Globo.

When they realized they were at the wrong gate, the passengers begged the airport employees to let them board the plane but were told they could not. "My legs are shaking; only God knows how I'm feeling," the man said after finding out the plane had crashed. "Thank God, we didn't get on that plane."

Doctors Killed in plane crash Vowed to Release Evidence linking modified mRNA "Vaccines" to Turbo Cancer

2nd Smartest Guy in the World, 12 August 2024
https://www.2ndsmartestguyintheworld.com/p/doctors-killed-in-plane-crash-vowed

The coverups must continue when it comes to all things slow kill bioweapon “vaccines,” with the latest assassination of doctors willing to expose the global PSYOP-19 eugenics project being yet another case in point; to wit:

In the recent airplane crash in São Paulo, Brazil, six prominent scientists were among the victims. The crash occurred on August 9, 2024, and involved a Voepass ATR 72 twin-engine plane carrying 61 (2SG: 62) people. Among those who perished were eight doctors heading to an oncology conference, which included the six scientists.

The identified scientists include:

1. Dr. José Roberto Leonel Ferreira, a senior radiologist who had a significant impact in the field of radiology, particularly in pediatric radiology.
2. Dr. Mariana Belim, an intensivist in the Adult ICU at the Western Paraná University Hospital (Huop).
3. Dr. Ariane Risso, also from the Uopeccan Cancer Hospital in Cascavel.
4. Edilson Hobold, a professor of physical education.
5. Deonir Secco, a professor of agricultural engineering.
6. Raquel Ribeiro Moreira, a literature professor at the Cascavel campus.

These individuals were respected professionals in their respective fields and were traveling to share their knowledge and expertise at the conference.

Eight cancer doctors who dedicated their lives to saving others and blowing the whistle on the devastating turbo cancer epidemic sweeping the world have been found dead. The bodies of six world-leading oncologists and two resident medics were found on Friday in the wreckage of a plane that plunged from the sky in Brazil and exploded in a fireball, killing all 62 people on board.

The doctors were on their way to an international conference in Sao Paolo where they were set to present their findings that mRNA and the COVID-19 vaccines are responsible for the explosion of turbo cancers and autoimmune disease wreaking havoc around the world today.

Mainstream media are working overtime to brush this story under the carpet on behalf of Big Pharma, but the facts are damning and we are not going to let them cover up the truth.

Anyone presenting a legitimate cancer cure to the world is at risk of being murdered by the Medical and Intelligence Industrial Complexes, so without further ado the following may very well be the holy grail (turbo) cancer cure using inexpensive repurposed drugs and supplements that the powers that be desperately do not want you to know about:

New & Improved Synergistic Joe Tippens Protocol

…

And if this Substack were to suddenly go radio silent, please know that if I have some kind of shellfish allergy I never knew I had, or I lose my balance near an open window, or get nail-gunned to the back of my skull I promise you I’m not clumsy and I never ever wanted to off myself…

They want you dead.

INDEPENDENT

Eight cancer doctors among dead in Brazil plane crash – as seven others changed flight at last minute

Independent, 12 August 2024
https://www.independent.co.uk/news/world/americas/brazil-plane-crash-cancer-doctors-killed-cause-b2594898.html

At least eight cancer doctors who were heading to an oncology conference were among dozens killed in a plane crash in Brazil's Vinhedo on Friday, an official has said.

The ATR 72 twin-engine plane carrying 58 passengers and four crew members was headed for Sao Paulo's Guarulhos international airport when it nose-dived and crashed in Vinhedo, said Voepass airlines, which operated the aircraft.

Emergency crews confirmed on Saturday they had recovered the remains of all 62 victims, including an unaccounted person later found to be on the plane.

An official from the Regional Medical Council said he was able to confirm the deaths of the eight doctors.

"These doctors were going to an oncology conference. These were people who dedicated their lives to saving others," said Eduardo Baptistella, according to the *Daily Mail*.

He added that a total of 15 doctors were supposed to be travelling to the conference on the flight, but seven of them had taken an earlier service.

The Uopeccan Cancer Hospital in Cascavel confirmed to BBC Brasil that two of its trainee doctors were among the fatalities.

Parana state governor Ratinho Junior was also quoted as saying at least eight physicians were on board the flight, and that the death toll also included four professors at Unioeste university in western Parana.

Rescue workers and Brazilian emergency crews said the bodies of most of the victims – 34 males and 28 females – have been moved to Sao Paulo's police morgue for identification.

The bodies of the pilot and co-pilot were identified earlier on Saturday, said Dario Pacheco, the mayor of Vinhedo.

The victims include four people with dual citizenship, three Venezuelans and one Portuguese woman, said regional carrier Voepass.

Firefighters at the crash site said officials are using seat assignments, physical characteristics, documents and belongings such as mobile phones to identify the victims.

Family members of the victims are being taken to Sao Paulo to provide DNA samples to help in the identification of remains, said state civil defence coordinator Henguel Pereira.

Four people with dual citizenship were among the victims, three Venezuelans and one Portuguese woman, according to Veopass officials.

NATURAL NEWS
Defending Health, Life and Liberty

Ethan Huff

Doctors killed in Brazilian plane crash promised to release evidence tying mRNA "vaccines" to Turbo Cancer

Natural News, 18 August 2024
https://www.naturalnews.com/2024-08-18-doctors-brazil-evidence-mrna-vaccines-turbo-cancer.html

The other day, we reported that eight of the 62 (not 68 as was originally reported) people who died in the recent ATR 72 turboprop plane crash in Sao Paulo, Brazil, were doctors headed to an important oncology conference. It has since come out that six of these eight were also scientists who planned to expose mRNA (modRNA) "vaccines" as a cause of turbo cancer.

https://www.youtube.com/watch?v=kZ6dzKbU3WM
https://www.unioeste.br/portal/central-de-noticias/66289-nota-de-pesar-31

The following six scientists were planning to do a really good thing before someone sabotaged the plane they were traveling on to ensure their message was never sent or received:

1) Dr. José Roberto Leonel Ferreira, a senior radiologist who had a significant impact in the field of radiology, particularly in pediatric radiology
2) Dr. Mariana Belim, an intensivist in the Adult ICU at the Western Paraná University Hospital
3) Dr. Ariane Risso, also from the Uopeccan Cancer Hospital in Cascavel
4) Edilson Hobold, a professor of physical education
5) Deonir Secco, a professor of agricultural engineering
6) Raquel Ribeiro Moreira, a literature professor at the Cascavel campus

All six of these individuals were highly respected professionals in their respective fields. The purpose of their travel was to share their expertise in front of a large audience, which apparently had to be stopped to keep a lid on the truth. The other two medical professionals who perished were resident medics, reports indicate.

Assassinating the truth

Had the plane been allowed to land safety rather than mysteriously crash in a residential neighborhood not far from the event, it would have exposed to the entire world the ugly truth about mRNA and what it does to the human body.

The corporate media initially reported on the crash as a mere event, failing to explain who was aboard the plane. It took the independent media to dig a little bit deeper and discover that this was apparently an assassination effort aimed at some of the world's best minds.

The *2nd Smartest Guy in the World* Substack shared what is known as the "new and improved synergistic Joe Tippens protocol" which may help those suffering from mRNA-induced turbo cancer to overcome their illness. The protocol is as follows:

- 400-800 milligrams of tocotrienol and tocopherol (all eight forms of vitamin E) every day, i.e., Gamma E by Life Extension of Perfect E
- 600 mg per day of bioavailable curcumin, i.e., Theracurmin HP by Integrative Therapeutics
- 62.5 micrograms (2,500 IU) of vitamin D every day
- 1-2 droppers full (roughly 167-334 mg) daily of CBD-X, the most potent form of full-spectrum cannabidiol oil containing 5,000 mg of activated cannabinoids and hemp compounds, i.e., CBD, CBN, and CBG
- 300 mg of fenbendazole six days a week, or up to one gram daily in the case of severe turbo cancers
- 24mg daily of ivermectin, or up to one gram daily for severe turbo cancers
- Two capsules of VIR-X immune support daily

This protocol is said to work exceptionally well for turbo cancers, and there are links at 2ndsmartestguyintheworld.com for purchasing these recommended products.

"The loss of these doctors is a significant setback to the medical freedom movement in Brazil," commented Dr. Chris Flowers, MD. "Pray for their families, and keep fighting. Several of us testify in National and international hearings on COVID and turbo cancers and will miss their input."

Another shared the story of her local doctor who was persecuted by the medical police state in Florida for treating Lyme disease patients.

"He had a visit by trench coats in the 2010', in Florida, and was told to stop treating Lyme or he was done," this person explained. "He's just waiting to retire now, a zombie since the jabs. A once brilliant doctor."

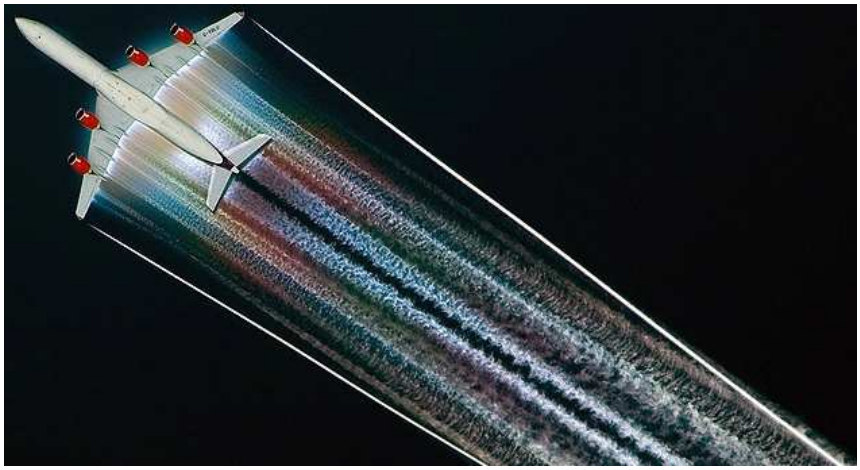
Florida Senate passes bill banning geoengineering and weather modification and Governor DeSantis has indicated it will become law

NewsTarget, 5 April 2025
https://www.newstarget.com/2025-04-05-florida-senate-passes-bill-banning-geoengineering-and-weather-modification.html

In a significant move that has sparked both praise and controversy, the Florida Senate passed Senate Bill 56 (SB-56) on Thursday, prohibiting geoengineering and weather modification activities within the state. The bill, often referred to as the "chemtrails bill," passed with a strong majority vote of 28-9, marking a pivotal moment in the ongoing debate over atmospheric interventions.



The bill's provisions and public concerns

SB-56 explicitly bans the "injection, release, or dispersion, by any means, of a chemical, a chemical compound, a substance, or an apparatus into the atmosphere within the borders of this state for the express purpose of affecting the temperature, weather, climate, or intensity of sunlight." This prohibition comes in response to widespread public concerns about the potential health and environmental impacts of geoengineering practices.

Bill sponsor Senator Ileana Garcia emphasized the importance of the legislation, noting that her constituents have repeatedly expressed concerns about "condensation trails, aka chemtrails." She stated, "There's a lot of skepticism. I have a problem with people spraying perfume around me sometimes, don't you have a problem with people spraying things into the atmosphere that really have no type of empirical data, that you just don't know who they are or what they're doing?"

The bill also mandates that the Florida Department of Environmental Protection (FDEP) establish a system for residents to report suspected geoengineering activities. The FDEP will be responsible

for investigating these claims, ensuring that any unauthorized atmospheric interventions are addressed promptly. This will ultimately lead to paranoid claims about jet contrails, sparking multiple investigations that come up empty.

Desantis supports a ban on chemtrails

Florida Surgeon General Joseph Ladapo voiced his support for the bill, highlighting the potential health risks associated with geoengineering. "Big thanks to Senator Garcia for leading efforts to reduce geoengineering and weather modification activities in our Florida skies," Ladapo posted on X. "These planes release aluminum, sulfates, and other compounds with unknown and harmful effects on human health. We have to keep fighting to clean up the air we breathe, the water we drink, and the food we eat."

However, Governor Ron DeSantis, while supportive of the bill, expressed frustration with the House version, which he described as "gutted." The House version of the bill does not outright ban weather modification but requires a license for such activities, with less severe penalties. DeSantis stated, "The Florida House of Representatives has gutted Sen. Garcia's legislation, and they would actually codify the practice of geoengineering and weather modification."

Broader implications and national trends

If SB-56 is passed by the Florida House and signed into law, Florida will join Tennessee as the second state to ban geoengineering. Tennessee's law, which went into effect on July 1, 2024, sets a precedent that other states are now following. Over two dozen states, including Kentucky, New Hampshire, Rhode Island, and South Dakota, have introduced similar legislation in 2024 and 2025, indicating a growing national movement against atmospheric interventions.

California-based attorney Nicole Shanahan applauded the bill, emphasizing the need to expose the entities funding geoengineering projects. "Banning geoengineering at the state level is a good start, but real change happens when we expose the bad actors who have been funding these projects and are heavily invested in preventing an end to this at the federal level," Shanahan wrote on X.

The debate over geoengineering is not new. For decades, concerns have been raised about the potential unintended consequences of large-scale atmospheric interventions. Critics argue that these practices, often funded by powerful entities like the World Economic Forum and individuals like Bill Gates, could exacerbate environmental problems rather than solve them. RFK Jr., in an interview last year, warned that these projects are often driven by a desire for more social control.

"They aggravate the problem then sell us the solution," he explained, adding, "The solution they want is more social controls."

As Florida stands on the brink of becoming the second state to ban geoengineering, the implications are far-reaching. The bill not only addresses immediate public health and environmental concerns but also sends a strong message about the need for transparency and accountability in scientific and technological interventions. The question remains: Will other states follow suit, and how will this movement impact the broader conversation on climate change and environmental stewardship?

Глава 9. ММСП 2005 – как административный инструмент ВОЗ

Чтобы лучше понять, каким образом «Большая фарма» и финансовые игроки использует ВОЗ в своих интересах, в качестве механизма реализации своей политики, надо проследить, как изменялись полномочия и возможности ВОЗ в качестве международной организации.

Напомним, что в соответствии с ст. 21 Устава ВОЗ Ассамблея здравоохранения ВОЗ имеет полномочия устанавливать права, касающиеся санитарных и карантинных требований, номенклатур болезней, стандартов диагностических методов исследования и пр. При этом в ст. 22 говорится, что «правила, принимаемые в соответствии со ст. 21, становятся обязательными для всех членов после того, как будет сделано должным образом оповещение об их принятии Ассамблеей здравоохранения, за исключением тех членов Организации, которые известят генерального директора в указанный в оповещении срок об отклонении их или оговорках в отношении них».[168]

Таким образом, правила, установленные ВОЗ, не носят автоматически обязательного или приказного характера, и принятие или отклонение их зависит от согласия самих государств-членов.

Проводит в жизнь решения Ассамблеи Исполнительный комитет, который может, в соответствии со ст. 28 (i) «в пределах круга ведения и финансовых возможностей принимать чрезвычайные меры в случаях, требующих немедленных действий. В частности, он может уполномочить Генерального директора принимать необходимые меры по борьбе с эпидемиями, принимать участие в организации медицинской помощи жертвам народных бедствий» и пр.

С 1969 г. действовали Международные медико-санитарные правила (ММСП), обеспечивавшие мониторинг и контроль 6 серьёзных инфекционных заболеваний: холеры, чумы, жёлтой лихорадки, оспы, возвратного тифа и эпидемического тифа. Но при этом только 3 болезни подлежали международной регистрации, при которой государства должны были уведомить ВОЗ о появлении этих болезней на своей территории: это холера, чума и жёлтая лихорадка.

Однако в связи с тем, что в начале 90-х годов в условиях обострения общей геополитической обстановки вновь стали распространяться такие болезни, как холера и чума, а также появились новые инфекционные заболевания (лихорадка Эбола), ВОЗ приняла в 1995 г. на своей 48 сессии резолюцию о пересмотре ММСП. В качестве аргументов, обосновавших необходимость пересмотра, были приведены зависимость от официальной системы уведомления об этих болезнях и отсутствие формального и международного скоординированного механизма для предотвращения их распространения.

В итоге 23 мая 2005 г. на 58 сессии ВОЗ были приняты новые *Международные медико-санитарные правила* (**ММСП)**, вступившие в силу в 2007 г. и ставшие одним из базовых документов, регламентирующих деятельность этой организации.[169]

ММСП представляют собой международный договор (закон), устанавливающий глобальные правила в области общественного здравоохранения с целью усиления медико-санитарной безопасности на национальном, региональном и международном уровнях. Его цель – предупредить международное распространение болезней, проводя профилактические и противоэпидемические мероприятия. Они нацелены на укрепление коллективной защиты здоровья населения от многочисленных и разнообразных рисков в современном глобализированном мире, которые могут быстро распространяться в глобальном масштабе в результате увеличивающихся объёмов международных поездок и торговли. Руководство работой ВОЗ по координации осуществления ММСП ведет Департамент по глобальному потенциалу в области предупреждения о вспышках болезней и ответных действий.

Этот договор расширил возможности и полномочия ВОЗ и его генерального директора и стал инструментом, играющим ключевую роль в обеспечении глобальной безопасности в области здравоохранения.[170]

Основные изменения, внесённые в ММСП, заключаются в следующем.

ММММСП расширяют масштаб правил и охватывают теперь существующие, новые и вновь возникающие болезни, включая острые патологические состояния, вызванные неинфекционными болезнетворными агентами. В силу новой правовой основы ММСП обеспечивают быстрый сбор информации, общее понимание того, что могут представлять собой *чрезвычайные ситуации в области общественного здравоохранения, имеющие международное значение* (**ЧСОЗМЗ**), а также возможность оказания странам международной помощи.

...

Таким образом, Гендиректор ВОЗ получает, как мы уже указывали, очень большие полномочия, и с учётом крайне размытых критериев для объявления ЧСЗМЗ и определяющего значения теневых механизмов и личного влияния всё это открывает неограниченные возможности для произвола.

Что касается правового статуса ММСП, то, в соответствии с Уставом ВОЗ, они автоматически становятся обязательными для всех государств-членов ВОЗ, если они активно и в течение ограниченного периода времени не заявили о своём несогласии с ММСП. Однако ни одно государство-член ВОЗ не вышло полностью из-под действия этих Правил, и только две страны сделали по ним определённые оговорки.

Одна – это Индия, сделавшая оговорку по поводу распространения на её территории жёлтой лихорадки. А вторая – это США, которые оставили за собой право принять обязательства по ММСП в форме, совместимой с её фундаментальными принципами федерализма. То есть правила эти будут выполняться Федеральным правительством или правительствами штатов в соответствии с конституцией, и в той степени, в какой обязательства подпадают под правовую юрисдикцию правительства штатов, Федеральное правительство представит такие обязательства вниманию соответствующих властей штатов.

...

И одновременно государства приобретают **следующие обязанности**, среди которых, в частности:

– назначение национального координатора по ММСП;

– проведение оценки событий, происходящих на их территории, и оповещение ВОЗ о всех событиях, которые могут представлять собой ЧСОЗМЗ;

– ответ на запросы, касающиеся проверки информации относительно событий, которые могут представлять собой ЧСОЗМЗ;

– направление в ВОЗ любых фактических данных об идентифицированных за пределами их территории рисках для здоровья населения, которые могут вызвать международное распространение болезни;

– применения усилий для проведения рекомендуемых мер;

– сотрудничество с другими государствами-участниками и ВОЗ в целях выполнения ММСП (2005 г.).

Соответственно новые функции и обязанности приобретает и ВОЗ ...

...

Согласно ММСП (2005 г.), ВОЗ следует в обязательном порядке уведомлять обо всех случаях следующих четырёх болезней: оспа, полиомиелит, вызванный диким полиовирусом, тяжёлый острый респираторный синдром (ТОРС) и человеческий грипп, вызванный новым подтипом вируса.

Одновременно с ММСП ВОЗ в том же году разработала шкалу, включавшую 6 «фаз предупреждений о вероятности пандемии» для гриппа и новых разновидностей гриппа:

1 фаза – низкий уровень риска заражения;

2 фаза – значительный риск заражения;

3 фаза – «случаи инфицирования человека новой разновидностью гриппа»;

4 фаза – передача вируса от человека к человеку ограничивается редкими случаями;

5 фаза – хотя «вирус всё еще не является в полной мере заразным, появляется значительный риск возникновения пандемии»;

6 фаза – соответствует периоду пандемии.

Таким образом, как мы видим, ММСП превратились в эффективный инструмент влияния ВОЗ, которая приобрела исключительные полномочия объявлять чрезвычайные ситуации в области глобального здравоохранения. После этого началась подготовка к большой пандемии гриппа.

Глава 10. Репетиции большой пандемии

Всем понятно, чем выгодна пандемия компаниям «Большой фармы», и как они на ней зарабатывают. Но тут есть ещё важный момент, который становится главным. Пандемия даёт фармкомпаниям возможность создать новую бизнес-модель, которая позволяет им работать без рисков и постоянно наращивать свою прибыль. Речь идёт не о лечении, а о предотвращении и профилактике болезней с помощью вакцинации. Но продвижению вакцинации препятствуют два фактора. Первый связан с принципом её добровольности, сохраняющимся в большинстве стран. А второй – с тем, что вакцинация против определённых видов заболеваний ведёт к появлению устойчивого иммунитета на всю жизнь к этим болезням и делает ненужной её повторение, что приносит фармкомпаниям первоначальный доход, который затем неуклонно снижается.

Решить эти проблемы можно следующим образом. Во-первых, сделать вакцинацию обязательной, напугав людей настолько, чтобы они приняли её как единственное спасение, и подстраховавшись соответствующими нормативно-правовыми актами. Во-вторых, вакцинировать от тех «вирусов», от которых невозможно получить устойчивый иммунитет в силу того, что они постоянно мутируют. Такими вирусами являются «вирусы» ОРВИ или гриппа.[174]

Именно к возможной пандемии гриппа и стала готовиться ВОЗ ещё с конца 90-х годов.

В 1999 г. она выпустила первый в своей истории документ, в котором говорилось о грядущей пандемии гриппа и который назывался *«План подготовки к пандемии гриппа: роль ВОЗ и руководство для национального и регионального планирования».*[175] Он был подготовлен рядом учёных в сотрудничестве с европейской научной рабочей группой по гриппу (ESWI), играющей центральную роль в обеспечении связей ВОЗ с исследовательскими европейскими институтами.[176] Поскольку эта группа спонсируется компаниями «Большой фармы», она находится под их влиянием. Среди них Roche, Sanof Pasteur, Novartis, GlaxoSmithKline, Astra Zeneca, Baxter и др. В состав группы тогда входили профессор К. Николсон из Лестерского университета в Великобритании и профессор А. Остерхауз из Университета Эразма в Нидерландах, участвовавшие в разработке препарата «Тамифлю» компании Roche. Последний был председателем исполкома ESWI. И показательно, что в том же году лекарство «Тамифлю» было выведено на рынок США вместе с другим препаратом, «Реленза» компании Glaxo Wellcome, вошедшей затем в состав GlaxoSmithKline.

В 2002 г. в штаб-квартире ВОЗ в Женеве прошла встреча экспертов по гриппу, на которой присутствовали представители фармкомпаний Roche и Aventis Pasteur и материалы которой вошли в *«Руководство по использованию вакцин и противовирусных препаратов во время пандемии гриппа»,* опубликованное ВОЗ в 2004 г.[177] А приложение к руководству с рекомендациями по использованию этих препаратов было написано Ф. Хайденом из Виргинского

университета, получавшим деньги за лекции и консультации компании Roche и GlaxoSmithKline. В нём рекомендовалось всем странам иметь большой запас противовирусных препаратов на случай пандемии. Авторами других приложений (по вакцинации в условиях пандемии и по пандемическому гриппу) были учёные А. Монто из Мичиганского университета и К. Николсон, которые также получали гонорары за консультации и помощь в проведении исследований Roche, GlaxoSmithKline (GSK) и ViroPharma, Wyeth, Chiron и Berna Biotech.[178]

Для внесения определённой ясности по поводу пандемии гриппа ВОЗ в 2003 г. на своей странице «Готовность к пандемии» дала такую информацию: «Пандемия гриппа возникает, когда появляется новый вирус гриппа, против которого у человеческого населения нет исходного иммунитета, *что приводит к нескольким одновременным эпидемиям по всему миру с огромным числом умерших и заболевших*. С ростом глобального транспорта и коммуникаций, а также урбанизацией и перенаселённостью, эпидемии, вызванные новым вирусом гриппа, вероятно, быстро распространятся по всему миру».[179]

В те же годы в США была разработана программа тотального карантина для населения, которую инициировал тогдашний министр обороны Джон Рамсфелд (2001–2006). Вряд ли было совпадением то, что в 1997–2001 гг. он возглавлял американскую биотехнологическую компанию Gilead Sciences, занимающуюся исследованиями, разработкой и коммерциализацией низкомолекулярных противовирусных препаратов, и именно у неё в 1996 г. купила лицензию на производство «Тамифлю» компания Roche. Став министром, Рамсфелд оставил за собой большой пакет акций компании.[180]

При Рамсфелде и Буше-младшем военное руководство активно изучало возможность противодействия атакам с использованием биологического оружия против американских военных, дислоцированных за пределами страны. В 2005 г. Министерство обороны и Служба охраны здоровья США предложили определённую методику карантина, которая превращала военные базы в объекты, недоступные для ликвидации с помощью биологического оружия. Военные базы США должны были быть превращены в закрытые города, способные выдержать длительную осаду и в которых можно без проблем прожить несколько месяцев. Для этого всех больных солдат необходимо изолировать в госпиталях, а для здоровых ввести казарменный режим с запретом покидать базы. Поскольку в представлении неоконсерваторов террористами являются все иностранные граждане, а у тех нет возможности проникнуть в расположения американских военных, базы будут защищены.[181][182]

Такую же методику Рамсфелд распорядился распространить на всё население США. То есть, в случае широкого применения биологического оружия тотальный карантин, который вначале собирались задействовать только на базах, должен был быть введён и для гражданских лиц. Разработать соответствующий план было поручено доктору К. Мехеру и доктору Р. Дж. Хэтчетту из Совета национальной безопасности, которые осуществили это в 2006 г. в Центрах по контролю и профилактике заболеваний (*Centers for Disease Control and Prevention* – CDC), представляющих собой федеральное агентство министерства здравоохранения США.[183]

План этот предполагал и введение социального дистанцирования как меры немедикаментозного вмешательства при борьбе с эпидемиями, которая впервые была широко применена в период средневековья. Озвучена эта идея была в Национальной стратегии по борьбе с пандемическим гриппом 2006 г., в которой говорилось: «Меры по защите границ и прекращению транспортировок будут наиболее эффективны для замедления пандемии, если они являются частью более масштабной стратегии, которая включает в себя другие виды вмешательства, такие, как меры по борьбе с инфекцией и гигиена рук и правила кашля, социальное дистанцирование, изоляция, вакцинация и лечение антивирусными препаратами». Как указал по этому поводу один из исследователей, «одна из закрытых сторон коронавирусного кризиса – это то, что идея, родившаяся из просьбы президента Буша-младшего по обеспечению лучшей готовности нации к следующей вспышке заразной болезни, стала сердцем национального руководства по ответу на пандемию»[184].

Надо отметить, что когда Мехер и Хэтчетт представили свой план, высокие чиновники, привыкшие опираться на фарминдустрию с её препаратами, встретили это предложение со скепсисом и насмешкой, поскольку оно рассматривалось как невыполнимое. Никто не мог представить, что эта идея будет доведена до абсурда и станет реальностью.

Однако тут важно подчеркнуть, что программа Рамсфелда рассматривалась им не столько как борьба против локальной эпидемии, сколько как инструмент реализации политического глобального плана, с помощью которого можно будет перестроить всю финансовую и социально-экономическую систему мира. Всемирная всеобщая самоизоляция приведёт к перестройке всего мирового сообщества и перераспределению задач по регионам, запустит ещё большую специализацию глобальной экономики, в результате которой США оставят себе главный сектор. Зоны, не интегрированные в глобальную экономику, должны быть лишены государственных институтов власти и превращены в простые резервуары природных ресурсов. Достаточно развитые зоны (в числе которых ЕС, Россия и Китай) будут ответственны за производство товаров широкого потребления, а производство вооружений для армии и полиции во всём мире будут обеспечивать только США.

Похожие идеи разрабатывались в Американском институте предпринимательства группой «Проект нового американского века». Но с этим связана и доктрина глобального разделения труда, именуемая доктрина Цебровски.[185]

А. К. Цебровски – вице-адмирал ВМС США, специалист по сетевым войнам, сторонник глобальной перестройки, предполагающей перераспределение производительных сил в пользу США, разрушение ряда производств и переориентацию промышленности в пользу вооружений и внедрение тотального электронного контроля над населением через мобильные телефоны. Главная ответственность за напряжённость в мире при этом возлагается на Китай, что требует его наказания и переустройства мира. Существует и ещё один важный пункт: переключение неявного финансирования СМИ, с интересов нефтяных на интересы фармацевтических компаний.

Таким образом, идея «всеобщей обязательной изоляции», предложенная 15 лет назад администрацией Буша, была изначально направлена не на обеспечение здоровья людей, а на милитаризацию американского общества на случай биологической атаки и для введения непрерывного управления, сметающего всю существующую официальную власть в США.

Тогда эта идея вызвала бурю протестов, которые возглавил профессор Дональд Хендерсон, руководивший одновременно Школой медицины при университете Джона Хопкинса и американской системой реагирования на эпидемии. Он оценил эти планы как окончательное скатывание администрации к тоталитаризму, приведшему к принятию «Патриотического акта» после теракта 11 сентября, и нарушение Конвенции о защите прав человека и основных свобод.[186] В 2017 г. при Трампе все официальные документы, в которых упоминались указанные меры, были уничтожены, а Ричард Хэтчетт стал директором Коалиции за инновации по предупреждению эпидемий (CEPI), которая координирует деятельность по разработке новых вакцин (к ней мы ещё вернёмся).

Однако инструкции были готовы и ждали своего часа. Так же, как уже были приняты новые международные медико-санитарные правила (ММСП), которые должны были вступить в силу в 2007 г.

Показательно, что разработка указанного плана и новых ММСП совпала по времени со вспышкой так называемого птичьего гриппа (H5N1), который начал распространяться ещё в конце 2004 г. Большую роль в пропаганде идеи о смертельной опасности этого гриппа сыграл уже упомянутый А. Остерхауз. До этого он способствовал раскручиванию паники по поводу атипичной пневмонии 2003 г., но эта тема уже была неактуальна и исчезла из поля зрения общественности, так что он перенёс своё внимание на новую болезнь.

Ещё в 1997 г. Остерхауз начал бить тревогу в связи со смертями в Гонконге нескольких человек, которые имели прямой контакт с птицами. Тогда он перешёл к продвижению в европейских правительствах утверждения о новой смертельной мутации птичьего гриппа, который передаётся людям. В своём интервью BBC о новой опасности в октябре 2005 г. он заявил, что «если вирус на самом деле мутировал таким образом, что он теперь может передаваться от человека к человеку, то мы имеем совершенно иную ситуацию, мы, возможно, стоим на пороге пандемии». Вирус так и не смог мутировать, но Остерхауз уже тогда был готов делать эксперименты, причём за огромные деньги.[187]

В декабре 2004 г. на сайте ВОЗ появилась информация, что распространение гриппа H5N1 может спровоцировать пандемию, характеристики которой предсказать невозможно, но это может затронуть от 20 % до 50 % всего населения. Указывалось, что большая часть мира не готова к пандемии и даже при самых оптимальных её сценариях от 2 до 7 млн человек умрут, а десятки миллионов потребуют медицинской помощи. Такую же цифру оглашал тогдашний руководитель программы ВОЗ по борьбе с гриппом, немецкий вирусолог и эпидемиолог Клаус Штёр. В связи с этим ВОЗ, подчеркнув, что глобальное распространение пандемии невозможно остановить, но надо снизить её воздействие, рекомендовала накапливать запасы противовирусных препаратов и вакцин и работать над продвижением разработки вакцин против пандемических вирусов[188].

В ответ на это многие правительства стали закупать большие объёмы лекарств «Тамифлю» и «Реленза», которые позиционировали как наиболее успешные в борьбе против гриппа. Особенно мощная кампания была развязана в США. О том, что страна должна быть готова к тому, что перелётные птицы, заражённые вирусом, доберутся до неё в течение последующих нескольких месяцев, заявил, в частности, глава Министерства внутренней безопасности Майкл Чертофф. По инициативе Буша-младшего американский конгресс, напуганный гипотетическими последствиями гриппа (с возможным летальным исходом от 200 тыс. до 2 млн человек), выделил на борьбу с ним 7,1 млрд. долл., из которых 2 млрд. пошло на закупку 20 млн. доз «Тамифлю». Массовые закупки США поддержали правительства Великобритании, Японии, Израиля и других государств, в результате чего Roche заработала от продажи лекарства более миллиарда швейцарских франков.[189] Что же касается Рамсфелда, то на пике страхов относительно угрозы эпидемии он удачно продал часть своих акций, получив чистую прибыль в 5 млн долл.[190]

Однако опасность птичьего гриппа оказалась не просто преувеличенной, но фальшивой, вместо прогнозируемых 7 млн человек жертвами гриппа оказались 400. Штёр, сыгравший решающую роль в принятой тогда стратегии ВОЗ, покинул эту организацию, заняв высокую должность в фармацевтической компании Novartis.

Волна массовых человеческих смертей не стала реальностью, но Roche и GSK уже вложили миллиарды долларов в производство неэффективных и опасных препаратов в надежде на государственные закупки в огромных масштабах. Поэтому не успела закончиться вспышка птичьего гриппа, как близкие к ВОЗ и Большой фарме учёные-медики стали предупреждать о возможной новой пандемии гриппа, подобного вирусу H1N1, который может иметь страшные последствия.[191] Так, в 2006 г. группа исследователи из Гарварда опубликовала в журнале «The Lancet» свои прогнозы о возможной гибели 62 млн человек, а оценка советника министра здравоохранения и социальных служб США профессора Остерхольма была ещё более драматичной – от 180 до 360 млн. погибших.[192] Активное участие в этой информационной кампании принимал всё тот же А. Остерхауз, прозванный «Доктором Гриппом».

В итоге, когда в марте 2009 г. из небольшой деревни Ла-Глория в мексиканском штате Веракрус пришло сообщение о заболевании, которому дали название «свиной грипп»,[193] а затем подобные случаи были зафиксированы в США, пропагандистский аппарат ВОЗ с непристойной поспешностью стал нагнетать обстановку.[194] 24 апреля ВОЗ выпускает первое сообщение о вспышке болезни по данному вопросу, подтверждающее инфицирование людей

в Мексике и США «вирусами свиного гриппа A/ H1N1… ранее не обнаруживавшихся среди свиней или людей», а 25 апреля она собрала Чрезвычайный комитет (ЧК), по совету которого гендиректор объявил ЧСЗМЗ, а в США начинается Неделя вакцинаций. 27 апреля после заседания ЧК ВОЗ поднимает уровень предупреждения о пандемии до 4-й фазы, а 29 апреля – до 5-й. Как заявила тогда гендиректор ВОЗ Маргарет Чен, все страны должны немедленно активировать свои планы по обеспечению готовности к пандемии. Во многих странах был введён масочный режим, учебные заведения закрывались, запрещены были массовые гуляния.

Однако для объявления пандемии оснований не было, так как не было «огромного числа умерших и заболевших» (критерий ВОЗ). Более того, сама М. Чан отметила тогда после жарких дебатов внутри ВОЗ, что «на сегодняшний день подавляющее большинство пациентов испытывает лёгкие симптомы и достигает быстрого и полного восстановления, часто в отсутствие какого-либо медицинского лечения» и что «во всём мире число смертей мало» и они не ожидают «увидеть внезапного и резкого всплеска числа серьёзных или смертельных инфекций».[195]

Но 4 мая на сайте CNN появляется статья, в которой профессор охраны окружающей среды Бостонского университета Д. Озонофф заявил, что слово «пандемия» не так страшно, как кажется, и что оно относится к тому, насколько широко распространена болезнь, а не к тому, насколько она серьёзна и сколько от неё умерло людей. В связи с этим один из репортёров CNN отметил несоответствие между этим утверждением и определением, данным на сайте ВОЗ. На что, в свою очередь, тут же ответила пресс-секретарь ВОЗ Натали Буду, заявившая, что определение ВОЗ было ошибочно и что оно удалено. Аргументировано это было тем, что определение было дано давно, оно рисует довольно мрачную картину и внушает страх. В итоге появилось «правильное определение», заключающееся в том, что «пандемия» не имеет никакого отношения к тяжести заболеваний или числу смертей и означает вспышки новых заболеваний по крайней мере в двух из 6 регионов, на которые ВОЗ делит мир.[196]

Позже пресс-секретарь ВОЗ Г. Хартл в интервью медицинскому сайту *Medscape* вообще заявил, что старое определение пандемии было только описанием, а не официальным определением: «Это не определение, но мы признаём, что оно могло быть так воспринято. Мы виноваты в путанице между определениями и описаниями». Это подтвердила и гендиректор Ч. Мон, заявившая, что старое определение пандемии было неофициальным.[197] И уже 11 июня ВОЗ заявила о 6 фазе, объявив, таким образом, впервые о пандемии гриппа.[198]

А чуть позже она ввела изменения в требования к отчётности по вирусной инфекции пандемического гриппа. Сославшись на то, что пандемия распространяется с беспрецедентной скоростью и что странам становится сложно или невозможно проверять и подтверждать эти случаи путём лабораторного тестирования, ВОЗ отменила выпуск глобальных таблиц с количеством подтверждённых случаев заболевания во всех странах. После чего точное число заболевших и умерших установить стало невозможно. Так, в США, по оценкам CDC, за год пандемии диапазон заболеваний составил от 43,4 до 89,3 млн человек, а диапазон умерших – от 8,8 до 18,3 тысяч.[199]

Что же касается числа умерших от свиного гриппа в мире в целом, то если по данным CDC оно составило от 151 до 575 тысяч,[200] то по данным ВОЗ – 18449 человек (при 491,3 тысячах подтверждённых лабораторно случаях заболевания).[201]

Для лечения ВОЗ рекомендовала всё те же «Тамифлю» и «Релензу», которые стали закупаться в огромных объёмах: 85 стран закупили 220 млн упаковок «Тамифлю» на сумму около 18 млрд. долл. (в России продажи препарата в 2009 г. выросли на 1000 %). То же самое произошло с вакцинами.

А в то время директором Инициативы ВОЗ по исследованию вакцин была д-р М.-П. Кини, которая до 1988 г. работала в биотехнологической компании Transgene SA, имевшей стратегические партнёрские отношения по производству вакцин с компанией Roche. До прихода в ВОЗ Кини также принимала активное участие в европейской инициативе по вакцинам (European

Vaccine Iniciative – EVI),[202] которая представляет собой ведущее европейское некоммерческое партнёрство, занимающееся разработкой вакцин, клиническими исследованиями и подготовкой учёных из стран с низким и средним уровнем доходов.

Его учредителями стали Стокгольмский и Гейдельбергский университеты, а членами:
– Центр биомедицинских исследований приматов (Рейсвейк, Нидерланды);
– Гейдельбергский университет (Гейдельберг, Германия);
– Фонд вакцин Дженнер (Оксфорд, Великобритания);
– Институт Пастера (Париж), и
– Королевский колледж хирургов в Ирландии (Дублин).

А донорами партнёрства являются ВОЗ, ЕС, Коалиция по инновациям в обеспечении готовности к эпидемиям (CEPI), Партнёрство по клиническим исследованиям в Европе и развивающихся странах (EDCTP), Глобальный фонд инновационных технологий здравоохранения (GHIT), Инициатива по инновационным лекарственным средствам (IMI), Nobelpharma Co., Ltd., Специальная программа исследований и обучения тропических болезней ВОЗ, SAP, а также агентства и департаменты министерств иностранных дел Дании, Нидерландов, Ирландии, Швеции и др.[203] Все эти структуры активно продвигают новые вакцины.

В итоге вакцинацией оказались охвачены миллионы людей. Через ВОЗ в страны, не имевшие собственного производства вакцины, было поставлено около 78 млн доз. В США было вакцинировано около 75 млн. человек (25 % населения), в Канаде 13,5-15 млн. человек (40–45 %), а в Финляндии – всё население.[204]

Однако и в данном случае опасность гриппа была сильно преувеличена. Так, одна только Германия заказала лекарств и вакцин от гриппа на сумму 450 млн евро, но волна заражения в стране была относительно лёгкой, а число смертей (258 смертей на 226 000 больных) оказалось меньше, чем обычная эпидемия сезонного гриппа. В итоге государственные запасы, оплаченные за счёт налоговых средств, из-за отсутствия спроса пришлось уничтожить. Великобритания первоначально подписала контракты о закупке 120 млн. доз вакцин, но из-за низкого числа заболевших было закуплено всего 44 млн. доз., причём из них к апрелю 2010 г. было использовано только 6 млн, а 3,8 млн. было передано структурам ВОЗ в Африке.[205]

Как выяснилось позже, по подсчёты банка JP Morgan, продажа вакцин должна была принести фармацевтическим компаниям дополнительную прибыль порядка 7,5-10 млрд долл. Ещё в 2005 году фармацевтические компании обязались держать свои лаборатории наготове и провести исследования, чтобы при необходимости приступить к быстрому производству вакцины против птичьего гриппа, а правительства при этом заверили, что закупят всё. В результате этой сделки фармацевтическая промышленность ничем не рисковала. Когда же встал вопрос о вакцине против свиного гриппа, компании потребовали, чтобы правительства выполнили свои обязательства. В результате последние закупили вакцины, но использовано их было всего 13–25 %, так что никто не знал, что делать с оставшимися закупленными препаратами.[206] Огромное количество вакцин и лекарств пришлось просто уничтожать в связи с истечением срока годности.

Когда так называемая пандемия пошла на спад, в адрес ВОЗ стало звучать всё больше критики. В связи со сложившейся ситуацией в декабре 2009 г. председатель комитета по здравоохранения ПАСЕ, немецкий врач и эпидемиолог Вольфганг Водарг подал ходатайство о вынесении рекомендации под названием *«Фальшивые пандемии – угроза здоровью»,* подписанное ещё 13 депутатами ПАСЕ.

В ходатайстве утверждалось, что с целью продвижения своих лекарств и вакцин фармкомпании повлияли на учёных и официальные структуры, ответственные за стандарты в области здравоохранения, которые подали сигнал тревоги правительствам всего мира. Пандемические кампании птичьего и свиного гриппа нанесли большой ущерб не только некоторым вакцинированным пациентам и бюджетам общественного здравоохранения, но и доверию и подотчётности международных учреждений здравоохранения, в связи с чем необходимо расследование их последствий на национальном и европейском уровнях.[207]

В январе 2010 г. в ПАСЕ впервые прошли слушания о роли ВОЗ в преувеличении опасности свиного гриппа и сговоре с фармацевтическими компаниями о необходимости вакцинации. На нём выступил с докладом один из авторов ходатайства П. Флинн, подчеркнувший, что общественность должна знать, как на самом деле принимаются решения о пандемии, поскольку есть убедительные доказательства того, что серьёзность пандемии была сильно преувеличена ВОЗ, а программа вакцинации была на самом деле «применением плацебо в громадных масштабах».

О том же говорил Водарг, назвавший историю со свиным гриппом «одним из крупнейших медицинских скандалов века» и обвинивший фармацевтические лаборатории в организации психоза вокруг него. Он подчеркнул, что изменение ВОЗ статуса пандемии позволило фармацевтическим компаниям «превратить эту возможность в звонкую монету посредством контрактов, которые в основном были тайными». В целом из-за решений ВОЗ борьба с эпидемией обошлась мировому сообществу в 18 млрд долл. Водарг также обвинил ВОЗ в использовании при разработке вакцин вещества, влияние которых на здоровье человека было недостаточно изученным. В итоге миллионы людей оказались привиты без каких-либо оснований, и неизвестно имеет ли вакцина позитивный эффект, так как она не была клинически протестирована. Вывод Водарга был однозначен: «ВОЗ предприняла непонятные меры, которые не могут быть оправданы научными фактами. Совет Европы должен провести расследование в отношении опасных действий ВОЗ».[208]

Водарг назвал историю с пандемией «одним из крупнейших медицинских скандалов века» и обвинил фармацевтические лаборатории в организации психоза пандемии, что является следствием «кровосмесительных связей между ВОЗ и фармацевтической промышленностью», позволяющих заработать фармкомпаниям на продаже вакцин.[209]

По итогам слушаний ПАСЕ в июне 2010 г. подавляющим большинством голосов приняла резолюцию № 1749 и рекомендацию № 1929, в которых говорилось о необходимости большей открытости ВОЗ.

Между тем самым серьёзным исследованием, посвящённым связям ВОЗ с фармацевтическими компаниями и их сговору о пандемии, стала статья журналистов Д. Коэн и Ф. Картера, опубликованная в «Британском медицинском журнале» (BMJ) в июне 2010 г. и носящая характерное название *«ВОЗ и «теории заговора» в связи с пандемическим гриппом».*[210] Название стало ответом на слова гендиректора ВОЗ М. Чан, заявившей, что все обвинения в фальшивости пандемии являются конспирологическими теориями. Авторы доказывают, что учёные, дававшие советы ВОЗ по планированию действий во время пандемии, выполняли оплачиваемую работу для фармацевтических компаний, которым были выгодны подготавливаемые рекомендации, но, естественно, об этом конфликте интересов ВОЗ никогда публично не заявляла. Среди них, в частности, доктор Дж. Вуд, работавший с противогриппозными вакцинами по договорам с Sanof Pasteur, CSL, IFPMA, Novartis и Powdermed; профессор А. Монто, консультировавший по гриппу компании GSK, Novartis, Roche, Baxter и Sanof, получавший от них соответствующие гонорары и, будучи членом Чрезвычайного комитета, принимавший решение об объявлении пандемии. Кстати, имена членов Чрезвычайного комитета не раскрывались вплоть до окончания пандемии, о которой было объявлено 10 августе 2010 г.

Руководство ВОЗ не могло проигнорировать критику в свой адрес, но реакция на неё была очень своеобразной. Оно отказалось от прежней шестифазной шкалы «предупреждений о вероятности пандемии», приняв решение, что в случае резкого ухудшения эпидемиологической обстановки будет объявлять ЧСЗМЗ, которая теперь может иметь три класса последствий: 1-й класс – минимальные, 2-й класс – умеренные и 3 класс – значительные.[211] Понятно, что данное положение открыло ещё больше возможностей для произвола в решении данного вопроса.

После этого и до появления COVID-19 ВОЗ 4 раза объявляла о ЧСЗМЗ – по поводу полиомиелита и лихорадки Эбола в Западной Африке в 2014 г., по поводу эпидемии лихорадки Зика в 2015–2016 г. и по поводу продолжающейся лихорадки Эбола в Киву в 2018 г.[212]

Что же касается пандемии, то с 24 февраля 2010 г. на сайте ВОЗ она определена следующим образом: «Пандемия – это распространение нового заболевания в мировых масштабах. Пандемия гриппа происходит, когда появляется новый вирус гриппа и распространяется по всему миру, и большинство людей не обладают иммунитетом».[213] То есть тяжесть заболевания для ВОЗ и высокие показатели смертности больше не являются критерием пандемии, хотя этот подход и вызывает решительную критику специалистов. А в сознании людей это слово ассоциируется именно с масштабным бедствием. Совершив такую подмену, ВОЗ приобрела возможность бесконтрольно манипулировать этим термином.

193. Примечательно то, что симптомы имели смысл с точки зрения близости от одной из крупнейших свиноферм в мире, находящейся в La Gloria и принадлежащей компании Smithfeld Farms из США. Местные жители несколько месяцев пикетировали управление компании Smithfeld Farms в Мексике с жалобами на проблемы с дыханием, связанные с огромным количеством свиного навоза в резервуарах рядом с фермой. Но реальные причины заболевания в La Gloria, по-видимому, не интересовали Остерхауза и его коллег-консультантов ВОЗ. Долгожданная «пандемия», предсказанная Остерхаузом еще во времена «эпидемии» атипичной пневмонии в китайской провинции Гуандун в 2003 году, теперь, наконец, случилась.

Universal treatment of acute infectious diseases

Mikhail Teppone

**The phase dynamics of the COVID-19 pandemic:
a systematic analysis of 213 Countries and Territories**

Probl Soc Gig Zdrav Istor Med, July 2022; 30 (3): 347-355
DOI: http://dx.doi.org/10.32687/0869-866X-2022-30-3-347-355

1.2. Infectious disease is a battle between the human body's defense and viruses or bacteria

History of the battle against viruses and bacteria dates back at least several thousand years. Ancient physicians already knew about external pathogens which could cause acute febrile diseases. They also knew that an evolution of any clinical case depended on the health status of the patient before the onset of the disease, so they talked about «body defense». At the beginning of modern microbiology, the importance of body resistance was confirmed by a Prof. Max von Pettenkofer, who swallowed the entire contents of a tube filled with germs of cholera, but nothing happened to him. So, he claimed: «*The important thing is the disposition of the individual*!».[1]

Despite a variety of external pathogens, the human body has a limited number of defense mechanisms, which is accompanied by a few clinical syndromes, consisting of common symptoms, such as fatigue, chills or hot feeling, headache, cough, shortness of breath, nausea, vomiting, diarrhea, skin rashes or discoloration of the skin, etc.

In ancient times the mechanism of the onset of fever was differentiated into two main groups (*hot* & *cold*) based on the presence of thirst, sweating, chills, or feelings of heat; and the choice of individual treatment was determined by the type of fever. According to the modern view on fever, which commonly accompanies infectious diseases, one can define only two mechanisms leading to an increase in temperature: one is an increase in heat production (a ***cold*** type) and the other, a decrease in heat transfer (a ***hot*** type), or their combination.[2] Thus ancient and modern explanations of fever are quite similar, and two types of antipyretic medicines are necessary and sufficient to manage any case of excessive fever. Similarly, 2–3 mechanisms can be identified that underlie each of the remaining symptoms of any acute viral disease, so, a small group of commonly used drugs would be sufficient to manage any infectious diseases, including *old* and *new* ones.

After the discovery of bacteria and viruses as a cause of infectious diseases, the main emphasis was changed from supporting the body resistance to the fighting against pathogens. It was successful in the majority of bacterial infection cases, but it was almost useless when disease was caused by a virus.

Therefore, if there is no etiotropic treatment, then there is no need to identify a new viral disease. All pharmaceutical and non-pharmaceutical therapeutic modalities would be addressed to the well-known protective mechanisms of the human body, and treatment should be based on the leading syndromes and symptoms, using the principle called *off-label* therapy.

1.4. Treatment of patients suffering from acute infectious diseases

About 1800 years ago, Dr. Zhang Zhongjing summarized the results of research from previous generations and developed a theory of acute infectious diseases, which explained therapy based on leading clinical symptoms and syndromes.[3] According to this theory, there could be only 6 phases, and certain phases could have 2–3 variants. Thus, the whole variety of clinical syndromes related to infectious diseases was limited to 10–12 variants, each having specific treatment and prevention.

There are some examples of treatment of the initial phases of infectious diseases: in the case of initial fever with general cold feelings without sweating – *Herba Ephedrae* was recommended; if there is initial fever with general hot feelings – *Folium Mori Albae* or *Herba Menthae Haplocalycis* should be used; if there is initial fever with intensive sweating or tension in the muscles – *Ramulus Cinnamomi Cassiae* was recommended; in the case of fever with alternating cold and hot feelings – *Radix Bupleuri*, was used, etc. A change in symptoms pointed to a change in the phase of the disease and required an adjustment of therapy. If a patient has a severe fever with hemorrhagic symptoms, skin rashes, kidney and liver impairment, delirium, etc. – *Radix of Isatis tinctoria* should be applied.[4]

(a) Phases of Defense System Affection	(b) Six Phases of Acute Infectious Diseases		(c) General Adaptation Syndrome by H. Selye
Activation of defense	1. *Tai Yang*	- Common cold symptoms	**Alarm Phase**
Unstable phase	2. *Shao Yang*	- Unstable phase	
Highest activity of defense	3. *Yang Ming*	- Progressive fever	(Adaptation Phase)
Exhaustion of defense	4. *Tai Yin*	- Beginning of exhaustion	**Exhaustion Phase**
	5. *Shao Yin*	- Hemorrhagic and other Complications	
	6. *Jue Yin*		

Theories which describe phase evolution of acute infectious diseases:
(a) Four phases of defense in a case of disease caused by "excessive heat".[5]
(b) Six phases of diseases caused by either "cold" or "heat", or "wind".[3]
(c) Three phases according to the general adaptation syndrome theory discovered by Hans Selye.[6-8]

...

During later centuries, protocols of infectious disease treatment were updated according to the new scientific discoveries of that time. Excepting deadly epidemic diseases (plague, smallpox, or cholera), therapy of other infectious diseases was effective and successful.

Theoretically, modern medicine having a long history in the past and advanced pharmaceutical science nowadays must be able to treat any problem more effectively than our predecessors, but the helplessness of the modern medical system during the current pandemic (2019-2022) was beyond common sense, and raised questions about the quality of education of the distinguished medical leaders and their followers.

...

As far as acute infectious diseases are concerned, their pathological condition is not stable, but has several phases. Each of the phases requires the use of different medicines and patient care. It would be illogical to look for the treatment of COVID-19 in general, when each phase of the disease requires an appropriate group of medicines. Then a doctor should choose one or two medicines, taking into account the main symptoms of a certain patient.

Multiple attempts to find a unique medicine against 'COVID-19' have failed. That suggests that treatment of COVID-19 or any further new acute viral infectious diseases should be managed by means of routine drugs applied as *off-label* therapy.
